bacteria. This is being increased amount of food to eat in the soil, so early spring gives plants that is really start, which enables them to get the better of their insect foes. This state is, at home, produced where applications of soda, nitrate of soda, etc., are used as detergents to such pests as the Omnivore and Turnip Fly. *W. Loun, Philadelphia.*

CROPS AND STOCK ON THE HOME FARM.

NEW WHEAT

There is room for improved varieties of Wheat that will produce heavier yields of corn, and require less seed for sowing. Canadian and French sorts have been tried, but these, in many cases, have been found wanting in their adaptability to English soil and requirements. Canadian Wheat produces exceptionally "strong" corn, but is lacking in quantity owing to the smallness of the grain, and the average English standard of production—40 bushels per acre is not attained. Varieties that lack "strength" are not favoured by the miller; the large size of the "berries" adds to the measure, but their weakness reduces the quality of the flour, which has thus less market value. Strength in the berries is much influenced by the nature of the soil. No matter how good the cultivation on chalk, peat or sandy soils, the strength is distinctly below what it is even with ordinary cultivation in stiff soils.

I am testing a new variety from Mosses, Webb & Sons this season, which has a distinctly promising appearance. It is vigorous in growth, and does not require much seed per acre to produce a "plant," which is one of the most important qualities to aim for.

A friend in Essex has obtained by careful hybridisation, a promising new variety Carter's White Standup is one of the parents. When I inspected this variety on a five-acre plot early in June, the tillering properties of the variety were very pronounced. One plant taken at random contained no fewer than twenty-three heads, which is a strong point in its favour. One and a half bushel of seed was used per acre, which is a great saving, as the ordinary varieties require 2½ bushels per acre, and, later in the season, 3 to 4 bushels. This plot was not sown until March 5, and a late sowing in an unfavourable seeding time on stiff land is a disadvantage, and the good prospect of this improved variety is all the more remarkable.

SOCIETIES.

ROYAL HORTICULTURAL. Societies. Committee.

July 5. *Present:* Mr. E. A. Bowles, M.A. on the chair; Messrs. W. J. Bean, J. Fraser, W. C. Worsley, W. Hales, and F. J. Clatten den absent.

Pelonia Delphinica. Mr. W. C. Worsley showed spikes of *Delphinium* var. from Dr. Chapman, of Reigate, of which the terminal flower was regularly pelonia and spurred, and the peduncle twisted.

Festuca subarva. Mr. Fraser showed specimens of the hybrid grass *Festuca x holcus*, derived from *Festuca elatior* and *Lolium perenne*. It is a somewhat variable plant, approaching at times the one, at others the other parent, and is not at all infrequent, apparently especially in water-meadows.

Carrot plant. Mr. Bowles showed, on behalf of Mr. Elwes, the late-flowering Niphium Tris. L. Taitii, at its best after all others of this group are past; the Asiatic *Streptopus*

The size of the cars and how they will fill and open are points to be settled later, if they justify expectations, the name of the new variety England's Safeguard is very appropriate.

The late hot, dry weather has altered the appearance of the Wheat crop generally. Where the plant was pale in colour owing to excess of cold and continued rain, it has assumed the dense green colour which betokens success. In some cases the plant is thin owing to adverse wintry weather, and the depredation of rooks. In early sown plots the ears are stout, of good length, and have bloomed freely. With a resumption of hot weather the Corn should develop fully, and there is an entire absence of rust on the flag. *E. Molyneux, Swanmore Farm, Bishop's Waltham.*

SALE OF HARES

Many owners and occupiers are taking steps to reduce the number of hares on their lands in order to protect crops and pasturages. Under the existing law (the Hares' Preservation Act, 1892), no hares or leverets may be sold or exposed for sale until August 1. In order to prevent the hares now being killed from being wasted, and to secure their use as food, the Board of Agriculture has made an Order under the Defence of the Realm Regulations allowing hares or leverets to be sold or exposed for sale by any person entitled by law to do so, notwithstanding the statutory prohibition as to sale in the months of June and July.

SOLDIERS ON AGRICULTURAL WORK.

The military authorities have issued instructions that no soldiers who are now engaged on agricultural work are to be withdrawn from the land until further notice. This instruction applies to all the classes of soldiers who have been made available for agricultural work.

ANSWERS TO CORRESPONDENTS.

AMOUNT OF HAY IN A STACK: *E. C.* Your particular of the stack are not sufficient for us to estimate the amount of hay it contains. You say nothing of its density, the kind of grass, or whether it is the crop of 1916 or 1917. Whether the sides of the hay are tucked or not would make some difference in determining the weight. From your data we would give 16 tons as the approximate weight of hay. Sometimes hay shrinks from the sides of the stack considerably, and this, of course, would make a large difference in the weight of the stack. If it is a question of sale, why not sell by the ton when the stack is cut?

BEETLE ON A LABURNUM: *C. J. P. O.* The beetle sent is the cockchafer, or May-bug, *Melolontha vulgaris*. (See fig. 51, April 7, 1917.) In the early spring, the soil should be turned up, and the grubs exposed and destroyed.

CHERRY TREES GEMMING: *W. T. A. S.* There is an abundant growth of the spawn of a fungus in the cortex of the branch sent, but it is not possible to identify the fungus at this stage. It is probably a species of *Cytospora*. Cut out and burn all dead wood.

DRY BORDEAUX MIXTURE: *G. H. H. W.* Having had satisfactory experience of the effect of dry copper-sulphate mixture for Potatoes, you are quite right in continuing its use, but at the same time we think that the Board of Agriculture took the only course open to it in recommending a wet spray, for experience in the use of dry Bordeaux fungicide for Potatoes is not yet sufficient to justify the Board in recommending their general employment.

ENGAGING GARDENERS: *M. Z.* Write to the Director of National Service, St. Ermin's Hotel, Westminster, S.W. 1.

FURRY TREES. *Noëlle.* You should cut away the old, barren shoots from your Currants, and train in a sufficient number of young shoots to take their place. If the trees are Black Currants, cut away most of the old wood, as the Black Currant fruits on young wood, but in the case of Red and White Currants only cut away those old shoots which have ceased to bear. It is quite true that birds

eat the fruit-buds, and thus render barren trees which would otherwise fruit; you can prevent this by painting the buds with butter, or netting the bushes. To get rid of the caterpillars, syringe the trees, when all the fruit has been gathered, with an insecticide—not before, as it would render the fruit poisonous, especially if you used arsenate of lead, which is the best specific. You can use it again in the spring, before the fruit buds expand.

GAS LIME: *E. C.* One ton of gas lime per acre should be applied in the autumn. The lime should be allowed to lie on the surface for not less than a month before it is ploughed in. Half the quantity named would suffice if it is dug or ploughed in at the time of application.

GRAPES SPOTTED: *C. H.* The berries are affected by Grape rot (*Glossosporium ampelophagum*). Gather and burn any fruits, shoots, or leaves showing symptoms of disease, and dust flowers of sulphur on to the remaining foliage at intervals of ten days. Mix a small quantity of lime with the sulphur on the second application, increasing the quantity on every successive occasion, but not allowing the quantity of lime to exceed that of sulphur. In the winter thoroughly wash the branches with a solution of sulphate of iron. Do not employ rich stable manure in any quantity in the border.

HOT WATER PIPES: *F. A. P.* Take a caulking iron, or a sharp-pointed chisel, and carefully knock away as much as you can of the caulking between the two pipes. Be careful to avoid breaking either of the pipes, which are very brittle. Then warm the pipes at the junction, and work them about a little, when it should be possible to pull them apart.

HUTCH LILY: *W. X.* *Lilium Martagon* is the Hutch Lily, which is said to abound in Palestine in woods north of Tabor.

LIQUID MANURE: *C. H.* *Linwood* Liquid manure may be made by tying horse droppings and soot in a piece of sacking, and dropping it into a barrel of water, using the water from the barrel as required, and leaving the bag of droppings in the barrel until the water is exhausted. With regard to compound manures, although the ingredients of some of these are secret, others can be made at home. For instance, Tonk's Manure, used for all sorts of garden plants, but chiefly for Roses, is made as follows:

Superphosphate	12 parts
Nitrate of Potash	10 parts
Sulphate of Magnesia	2 parts
Sulphate of Iron	1 part
Sulphate of Lime (Gypsum)	3 parts

It is used in the spring at the rate of $\frac{1}{2}$ lb. to the square yard.

MORAEA (IRIS) PAVONIA: *F. A. G.* You should grow your plants of *Moraea Pavonia* (known in gardens, but erroneously, as "Iris" *Pavonia*) in the border in a cool greenhouse. Leave them there without any disturbance, and when they become thoroughly established they should flower. Keep them rather dry in the winter, and do not make the soil too rich.

NAME OF FRUIT: *L. S.* Apple Winter Greening (see French Code).

NAME OF PLANT: *W. J. Greenwood.* *Ameilanchier canadensis* (Juneberry). The fruits are largely used in North America in pies and puddings, and for preserving. Though perfectly edible, they possess no economic value in this country, being practically tasteless, cooked or raw.

PEAR AND NUTLEAF LEAVES USUALLY: *L. G.* The trees are attacked by the shot-hole fungus (*Cytospora fumissis*). Pick off and burn all the affected leaves, and next year, when the leaves are just expanding, spray the trees with ammoniacal solution of copper carbonate, repeating afterwards at intervals of a week or a fortnight. Do not use Bordeaux mixture for spraying Peaches, as the leaves are too delicate for this fungicide.

PEAR LEAVES ATTACKED: *H. M.* The leaves have been attacked by (1) the vaporar moth, (2) the Pear slug worm. Both the vaporar caterpillars and the larvae of the saw fly can

be killed by spraying with arsenate of lead. Do not spray the fruit, as the arsenate of lead is very poisonous.

PLUM TREE AFFECTED: *S. H.* The tree is affected with silver leaf disease. There is no remedy but cutting back every affected branch behind the discoloured portion, taking care to burn the cuttings, as the disease is very contagious. If the whole tree is affected, it will eventually have to be destroyed. The variety Victoria is very susceptible to the complaint. Be careful to watch for signs of the disease on any other trees of Plum or Apple, and cut back at once beyond the discoloration. The disease can, to a certain extent, be prevented by good cultivation; if the soil is cold and stiff, it should be well dug, and enriched with leaf mould or well rotted manure.

POTATOS: *J. F. F.* As your experience will have shown you, 2 feet 6 inches is not enough space to leave between strongly growing Potato plants if you want to intercrop. However, do not cut the leaves of the plants; your best plan will be to drive a stake into the ground by each plant which is overshadowing the greens, and lightly tie the Potato haulm to the stake.—*H. W.* The stems of the Potatoes have been injured, and the injury is now covered with a species of *Fusarium*. There is also present on the leaves late blight (*Phytophthora infestans*). Spray the plants at once with Bordeaux mixture or Burgundy mixture.—*P. G. S.* There is no fungus on the Potato, but the haulm is affected with "leaf curl." Spraying will not cure this, but the plants should be sprayed to prevent attacks of *Phytophthora infestans*.

ROSE LEAVES CUPLED: *R. H. and A. B.* The shoots have been attacked by the Rose sawfly (*Blennocampa pusilla*). Next spring watch carefully for the first symptoms of the pest, and pull off and burn all affected leaves. Remove the surface soil during the winter to a depth of 2 inches and either sterilise it or replace it with fresh soil in which Roses have not been grown.

STRAWBERRY LEAVES ATTACKED: *J. G., Monnyhan.* The leaves are attacked by the leaf beetle (*Gale-medella tenella*). The best remedy is to spray the plants with arsenate of lead, but not when they are in fruit, as it is very poisonous. We shall be glad if you will kindly send your full name and address, and further specimens of the affected leaves.

STRAWBERRY INFESTED WITH INSECTS: *M. P.* The insects are snake millepedes (*Blanulus pulchellus*). You should trap them by laying round the Strawberry beds pieces of Mangold or Turnip, preferably in a state of decay. Collect the pieces every morning, and if they are, as they probably will be, covered with insects, drop them into a basin of strong insecticide or carbolic acid solution. Soot spread over the ground acts as a deterrent.

TOMATOES: *P. W. J.* If you wish to keep Tomatoes for some time, they should be gathered when almost green. Spread them out on a board or a piece of soft paper, and keep them in a dark, cool place; they will keep for a week or a fortnight, according to the weather.

TOMATOES UNDER A WALL: *M. Z.* You can grow Tomatoes with every prospect of success in the situation you mention, and plant Cauldflowers and Cos Lettuces in the border. It is too late in the season for Potatoes or Peas. Next spring you can obtain early crops of Potatoes, French Beans, and Carrots in the warm border. If the soil is deficient in lime, apply old mortar rubble or slaked lime.

WINTER SPRAYING: *S.* Spray the trees in winter with a caustic alkali wash, and again in the spring, when the buds are just breaking, with arsenate of lead. Grease-bandaging is still practised in well-tended orchards, and is very successful.

MARKETS.

COVENT GARDEN, July 13.

Table with columns: Plants in Pots, &c.; Average Wholesale Prices; s.d.s.d. Lists various plants like Aralia Sieboldii, Asparagus plumosus, etc.

Table with columns: Cut Flowers, &c.; Average Wholesale Prices; s.d.s.d. Lists various flowers like Achillea per doz., Alstromeria per doz., etc.

Table with columns: s.d.s.d. Lists various plants like Aspidistra, Cacti, Ferns, Heliotrope, etc.

Table with columns: s.d.s.d. Lists various plants like Aspidistra, Cacti, Ferns, Heliotrope, etc.

in demand. Those in the vicinity of Liberty, but only a few in the market. Alstromeria, Crocus, Calliope, Anemone, and Grand Daisies are selling freely. Stationery has been checked by the recent rains, and there is only a limited supply. White and mauve Sweet Sultan are selling freely. A few plants of White Lycopodium and Lobelia telekium (China) are on offer.

Table with columns: Vegetables; Average Wholesale Prices; s.d.s.d. Lists various vegetables like Artichokes, Beans, Broccoli, Carrots, etc.

Table with columns: Fruit; Average Wholesale Prices; s.d.s.d. Lists various fruits like Apples, Apricots, Blackberries, etc.

ORCHIDS.

Clean, well-grown and cheap; also Many Rare and Choice Varieties. STOVE AND GREENHOUSE PLANTS OF ALL KINDS. Kindly send for Catalogue. JAMES CYPHER & SONS, Exotic Nurseries, CHELTENHAM.

A SUBSTITUTE for ordinary 21 oz. glass, which is now so scarce. The new British Rolled Sheet is about 1/8 in. (or equal to stout 21 oz.) in thickness. Can be supplied to buyers' sizes, at favourable prices, delivered free and sound in the country in quantities. We also offer ordinary 21 oz. British Sheet Glass, under the same conditions.

Manufacturers of GENUINE WHITE LEAD PAINT. "BLACKFRIARS BRAND." Mixed ready for use. In 14lb. tins and 1 cwt. wide-neck cans. AND BEST LINSEED OIL PUTTY. Complete Price List of Paints, Colours, Varnishes, &c., on application.

GEORGE FARMILOE & SONS, Ltd., 34, ST. JOHN STREET, WEST SMITHFIELD, LONDON, E.C. And Blackfriars Wharf, Upper Ground Street, E.C. QUOTE GARDENERS' CHRONICLE.

Sample CRET Pot FREE with Booklet. Will convince you that the Drainage, Porosity, Healthiness of a CRETS would help your plants. Write PETER BAILEY & SONS, Ltd., 2 HEATON MERSEY POTTERY, near MANCHESTER.

THE WEATHER.

THE WEATHER IN SCOTLAND. The weather during June was mild, bright and dry. The total rainfall during the month was 1.56 inches, the highest being on the 23rd. The sun made its appearance on 18 days, but rain and gales a grand total of 21 1/2 hours of sun being in average of 2 1/2 hours per day, and an average of 4 1/2 bright days was the result. The total rain fell on 12 days, of which 4 1/2 inches fell during the first 10 days of the month, and the rest on the 17th, and was the heaviest since fall for the year. The maximum of 61.4 inches, or 1.592 inches, fell on the 21st, the rain on the 20th to 24.50 inches, and on the 22nd to 1.26 inches. Temperature of 71.1 degrees, while the 10th to 15th was 65.0, and on the 16th the maximum was 55.0, and on the 19th, and the minimum 55.0, on the 16th, while the mean maximum and minimum were 63.0 and 45.0 respectively. Thus the mean temperature of 55.0 is a mean range of 18.0, and of 18.0, the 10th to 15th. With a mean of 41.0, the minimum of the grass 41.0 to 30.0 on the 19th, this being the lowest night of ground thus during the month. At 1.00 o'clock the ground temperatures rose from 55.0 to 58.0, and at 2.00 to 56.0, and at 3.00 to 56.0. The previous day's rain fell from the southeast and the wind from James' Mill, St. Andrew's Provincial Committee at the Training College Gardens, Kirkton of Mary, near Dundee.

GARDENING APPOINTMENTS

Mr F J Hyland, 45 Gardner to St. John's, Hemby, Wain, Leach, Ablesdon, Surrey. Mr George W. Grass, 45 Gardner to S. P. Austin, Esq., Hallin Hall, Ripon, Yorkshire. SALE OF SURPLUS STOCK. We still hold certain small stocks of Garden Seats, Garden Engines and Pumps, also Garden Rollers, Water Carts, Garden Arches and Hand Ladders, which we shall be pleased to clear at special prices, subject to being unsold. Particulars on application. BOULTON & PAUL, Ltd., ROSE LANE WORKS, NORWICH.

TURF LOAM. Very Fibrous Yellow Turf Loam. For VINE BORDERS, CARBONATES, ROSES, MELONS, CHRYSANTHEMUMS, FERNS UNDER GLASS, etc., etc. Quotations Carriage Paid or Delivered. A. B. JOHNSTON, New Park, Cranleigh, SURREY.

THE HORTICULTURAL DIRECTORY AND YEAR BOOK.

INDISPENSABLE to EVERY GARDENER and NURSERYMAN.

In this, its Fifty-Eighth Year of Publication, this indispensable work has undergone a thorough revision. Every page has been purged of out-of-date, obsolete names, fresh ones added, and the whole work brought up to date. Numerous Fresh Features have been introduced, including a

CALENDAR OF GARDEN OPERATIONS

AND A LIST OF

NEW PLANTS FOR THE YEAR.

Another interesting feature is a set of Short BIOGRAPHICAL NOTICES of **PROMINENT HORTICULTURISTS and NURSERYMEN**

who have passed away during the year. Thus, by obtaining this DIRECTORY at the beginning of each season, one is enabled to keep pace with passing events in the horticultural world. There are still for sale a few copies of the current edition.

POTATO SPRAYING. On spot ready for immediate delivery. Sulphate of Copper 30 per cent., pure Washing 8-14 98 per cent. Water for process and quantity required per acre. — G. H. RICHARDS, 23, Borough High Street, London, S.E. 1.

SPRAY YOUR POTATOS.
INCREASE your crops and protect them from blight and disease by using KEELING'S SPRAYING MIXTURE ("Kiln") brand. Guaranteed free from lead and keeps indefinitely. A 4 lb. bag, with 25 gallons of water, is enough to spray twenty rods (two, and rods only 4s. 6d.; 3 lbs., 8s.; 1 lb., 13s. 6d.). 32 lbs., carriage free in the U.K. Sample 1 lb., 1s. 6d., post free. Send P.O. order, direct to the manufacturers, KEELING & WALKER, LTD., 20, Milton House, Surrey Street, London, W.C. 2.

SPRING CABBAGES — The best varieties to sow during the first part of August. Order at once.

SUTTON'S HARBINGER CABBAGE.
The earliest Cabbage for Spring Cutting.
Per packet, 1s., per ounce, 1s. 6d.
Trial of Autumn Cabbages. A trial of no less than 114 stocks, representing 94 sorts, was made at Wexley last year. It will be noticed that Sutton's Harbinger is the only one at the trial which gives Autumn and Spring sowing. — The Field, June 17, 1916.
Cabbage Harbinger is a capital variety. I sowed some seed in July, and now (January 10, 1917) I am writing some lovely heads. — Mr. A. F. Coles, The Garden, Wallasefield, Croydon.

SUTTON'S APRIL CABBAGE.
The most popular early Cabbage for garden use.
Per packet, 1s., per ounce, 1s. 6d.
"The April Cabbage you supplied me with last year have done wonderfully well, hardly a plant has been destroyed by the severe winter, and they are now coming in very useful." — The Rev. E. J. Rogers, May 4, 1917.
"The April Cabbage, raised from seed supplied by you last year, was wonderful. They were a lovely batch of plants, and not one bolted." — Mr. H. Brent, Framfield.

SUTTON'S FLOWER OF SPRING CABBAGE.
The most suitable for the general Spring crop.
Per packet, 1s., per ounce, 1s. 6d.
My best of Flower of Spring Cabbage was well worth photographing, and was far earlier than any others in this neighbourhood. — W. Webb, Esq., Dursley.
I sowed your April and Flower of Spring the best Cabbage in cultivation. Last September I planted 2,000 of them, and in the whole plantation there were but four plants not true to character. The bulk of these are being sent to the U.S. through the Vegetable Producers' Committee. — Mr. P. H. Scholly, Rothamsted Gardens.

BARR'S VEGETABLE SEEDS for July to September Sowing. Special List post free. BARR & SONS, King Street, Covent Garden, London.

FOR SALE, 500 400 Strong Wooden Boxes.
2 iron hinges, hump, and fastener; assorted sizes, 14 by 5, 22 by 14 by 24, 18 by 15 by 7, 18 by 12 by 12, by 4, 18 by 13, 21 by 15 by 5. Best offers. With seed samples. HUNTER'S DAIRIES, LTD., Chard, Somerset.

IT IS OF NO USE waiting until the war is over to advertise your wares. Even if you find it difficult to supply your customers, on account of shortage of staff and difficulties of transport, you should not cease to advertise. When peace is declared, there will be, at any rate for a time, increased activity in every branch of industry. When that time comes, with whom will your customers deal with the man who has not advertised for three years, and whose very name they have forgotten, or with the man who, by persistent and persevering advertising, has kept his name before the public? Memory is short, and people whose names are out of sight are also out of mind. After the war all your competitors will be struggling to obtain the business with which everyone will then be in a better position to cope. Are you going to miss your chance?

BRITAIN'S GREAT CABBAGE. WEBB'S EMPEROR CABBAGE.

(For July and August sowing.)
Earliest, best, and most popular Cabbage in cultivation. Remarkably free from any tendency to "bolt." 6d. and 1s. per packet, 1s. 6d. per ounce, post free.
Mr. G. Edmund, Head Gardener to W. H. Myers, Esq., Swammer Park, writes: "I should like to testify to the excellence of your Emperor Cabbage, it is really a gem. fit for private gardeners or market growers alike, and of splendid quality."
WEBB'S FAVORITE CABBAGE.
Early medium-sized heads, of splendid quality, 6d. and 1s. per packet, 1s. 6d. per ounce, post free.

WEBB & SONS, LTD., The King's Seedsmen, Stourbridge.

NOTES FROM A GALLOWAY GARDEN.—VIII.

Carnations, and streaked gill flowers—Which some call Nature's bastards—of that kind our rustic garden's barren; and I care not to get slips of them, for I have heard it said: There is an art which in their richness shares With great creating Nature, 'Tis not put The dibble in earth to set one slip of them.

Walter's Tale, iv, 3.

THE indifference which I cannot help feeling towards florists' flowers, and garden hybrids in general, approaches very near to the prejudice so frankly expressed above by Pindar. It is, therefore, with scant consistency that I venture to suggest what a brilliant race might be evolved by crossing the Mexican *Oenothera* raised with some of the golden-flowered species. The only defect in the carnine blossoms of the Mexican plant is their small size, which seems out of proportion to the abundant foliage.

Some hybrids, especially natural ones, are irresistible. *Primula Bulleyana* has turned out an irresistible flirt; most parts of the borders are peopled with his illegitimate, but charming, offspring. The other parent is not always to be identified. The stature of some of the brood indicates pulverulent blood, the soft rose tints in others point to *japonica* or *Bessiana*, while the fiery hue in others suggests *Cockburniana*. Now that *P. helodoxa* has joined the glad throng, further developments may be expected. The seed of these hybrids is fertile. I shall be happy to forward some to anyone who cares to send a stamped, directed envelope.

We spent an afternoon on a moorland meadow lately, selecting the best forms among myriad *Orchis maculata* for re-planting to the garden. It is strange that British terrestrial *Orchids* are not more commonly grown in borders, where some of them develop dimensions far beyond those they attain when competing with grass and other growths. Unlike most plants, our wild *Orchids* are most easily moved when in full flower, for the flowering stem proceeds from a tuber which is destined to disappear after the plant has seeded, a new tuber forming along side of the old one. If care be taken not to break the fleshy roots of the new tuber, the plant sustains no check in removal. The colour of *Orchis maculata* ranges from crimson to pure white, some of the intermediate forms being

beautifully pencilled and marbled with darker tints, the leaves of some being richly spotted, others plain green. In the marsh *Orchis* (*O. latifolia*) I have only found one variation from the full red purple (dangerously near magenta). The flowers of this variety are what milliners call "vieux rose." Among the crowds of *O. maculata* which enrich our moorlands in June, one comes from time to time upon specimens of commanding stature and large flower-spikes. These are natural hybrids between the spotted and the marsh *Orchis*, and make splendid garden plants, increasing into large clumps. One of these hybrids has long been supplied by nurserymen under the name of the Kilmorock *Orchis*.

Habenaria conopsea and the so-called Butterfly *Orchis*, *H. bifolia*, both deliciously scented, are worth cultivating, and so is the bright *Orchis pyramidalis*, for the welfare of which lime or chalk is essential.

In these days, when the influx of new plants from China and elsewhere far outstrips the capacity of anything less than a botanic garden and its staff, it becomes more necessary than ever to exercise discretion in excluding all except the most desirable species. In no genus is this more needful than in the shrubby *Spiraes*, most of which require ample room to develop their full beauty. Among the June-flowering

its impatience of summer drought. The difficulty of water-side planting for things of lowly growth is enhanced in this garden by the unhappy circumstance that there is no water therein, standing or running. There is, indeed, a long border irrigated by subterranean pipes for the benefit of Lilies, but *P. tosa* does not send its roots deep enough to profit by this provision. It cannot put up with dry surface soil. But to be without its glad-ome hue in March would be to miss one of the chief delights of early spring, so we set what wits we had at command to devise a satisfactory scheme, and hit upon one. A breadth of border facing north was made up with strong loam, peat, and sand, and planted with *P. rosea* from seed of the fine strain in Sir Frank Crisp's wonderful "paradise." In the middle was set a root of *Rodgersia tabularis*, which remains asleep until the *Primula* has set its seed, then rises and spreads its huge green umbrellas, each two feet across, over the bed. Throughout this blazing month of June the soil has remained cool and moist, not a leaf of the *Primula* has flagged, and the seedling stems are a foot high. In autumn a dressing of peat and sand will be laid over the plants.

This has proved an "annus mirabilis" for Lilies, just as 1916 was an "annus damnabilis." The prolonged cold of last spring

FIG. 9. SPIRÆA BRACTEATA. FLOWERS WHITE.

species, Mr. Bean gives the palm to the hybrid *S. van Houttei*, which he pronounces to be "probably the finest of all the white-flowering *Spiræas*, except, perhaps, *S. arguta*," which is another hybrid. It is with diffidence that I venture to differ from so high an authority; but certainly here *S. van Houttei* is eclipsed by the Japanese *S. bracteata* (see fig. 9). We have a specimen of each, well isolated, but growing within sight of each other, and we cannot dispense with either, for *S. van Houttei* precedes its rival by a fortnight. Both are profuse in bloom, but the sprays of the Japanese species are more richly clad with snowy clusters than the other, and last longer in bloom. In July the display is taken up by the loftier *S. cuneensis*, whereas the flowers are in rounded clusters, like those of the species afore-named, and set along whiplike branchlets, with charming effect. Following these in August are two splendid species, introduced from China by Mr. Wilson (S. *Honyi*), with its flowers in crowded rosettes, like those already referred to; and another, whereof I know not the specific name, in the way of *S. sorbifolia*, with huge terminal panicles of white blossom produced in succession well into September.

Many persons have found it hard to keep *Primula rosea* in satisfactory vigour, owing to

discouraged early growth; after the plants did make a start, all the conditions continued favourable, and there has been no check of vitality to let the dread *Botrytis* start an innings. One sometimes speculates what the choice should be if one were restricted to growing six species of Lily. It would be wise to keep to the easy sorts, leaving to experts such coy or fickle beauties as *L. rubellum*, *japonicum*, *leichthii*, and others. Even from a list so curtailed it would be hard to fix on the half dozen. The happy amateur for whom the peerless Madonna Lily yields her charms will hardly remain happy without her Naudin half sister, *L. testaceum*, and the presence of the white *Mar-tagon* positively postulates the swarthy *Dalmatian* as a foil to its purity. Only under duress could we be induced to exclude *L. Szovitzianum*; and as for *L. regale*, with the constitution of a dray horse and the grace of a thoroughbred, if Madonna be the queen, this is, without dispute, the Prince's Royal of the race. It has been hitherto beyond the reach of slender purses in war-time, but it is destined to become one of the commonest Lilies, being very easily raised from seed, which it produces generously. Among a batch of two-year-old seedlings here, some are actually flowering this summer; but they require four or five years to attain their full stature. One of the older bills

here has a stem over five feet high, bearing a crown of eleven great blooms.

And how we have come to the limit of half a dozen, without making provision for a single scarlet Lily, such as *L. pomponium* and *L. chalcidonicum*, or for any of the flaming Panther, and leaving the late summer and early autumn cheer-

ADAMSONIA DIGITATA IN INDIA.

At Allahabad, near the point where the rivers Ganges and Jumna meet, are to be found two very fine specimens of the above tree, and recently Mr. Head, Superintendent, Government Parks

we measured the trunk three feet or so from the ground level, also one of the roots. The circumference of the trunk was 56 feet 8 inches, and the root selected 91 feet in length. The other tree referred to is 42 feet 4 inches around the trunk just above the ground line. Both trees are situated almost opposite the fort of Allahabad, which was built by the Mogul Emperor Akbar some 500 years ago. T. W. Briston, Fort, Allahabad.

ORCHID NOTES AND CLEANINGS.

NEW HYBRIDS.

LAELIO CATLEYA AZAEL. We have received a flower of a very brightly coloured hybrid of medium size, taken from a plant blooming for the first time in the Orchid house of Elliot T. Nicholson, Esq., Stoneleigh, Setton Park, Liverpool. It was obtained by crossing *Cattleya Minucia* (Loddigesii's Warszewiczii) and *Laelia pumila pauciflora*, the latter showing very clearly in the tubular, close fitting base of the labellum. The sepals and petals are deep rosy-mauve, the base of the lip slightly darker, and the front ruby crimson, with a band of primrose-yellow in the middle area. The column is pure white.

ORCHIDOGLOSSUM HAMPSONI. A very handsome flower raised between *O. ardentissimum* and *O. splendens*. *O. crispum* has been used throughout in its ancestry. *O. Pescatorei* comes in twice, and *O. Wylekeatum*, one of the parents of *O. splendens*, sustains its reputation for imparting good qualities. The flower is of model form, white, with two-thirds of the inner parts of the segments light chestnut red, with line darker veining. The reverse side is tinged with light purple. It is sent by Panta Ralli, Esq., Ashtend Park (to Mr. W. H. Winter).

LAELIO CATLEYA S. O. SUNDENSON.—This plant is the result of crossing *Laelia purpurata* and *Cattleya Empress Frederick* (Mossiae's Dowiana aurea), and it is an acceptable addi-

FIG. 10. ADAMSONIA DIGITATA ON THE BANK OF THE RIVER GANGES.

tion without the splendor of *L. auratum* and the glowing clusters of the Tiger Lily.

Among all the Alpine species of *Dianthus*, there is none, methinks, so equal *D. calzonius* in beauty. This opinion may be held without doing any dishonour to the gaiety of the better forms of *D. neglectus* or the profusion of *D. alpinus*. The blossoms of *D. calzonius* are larger than either of these, and the delicately dotted crevet round the centre of the flower gives it the distinction which has justly earned its specific name. This *Pink* is reputed less easy to cultivate than the other species, but once it gets its roots well down among the stones and receives an occasional top dressing of loam and sand, no time, it is not likely to fail, and is not fastidious about aspect. One plant here has occupied a dry ledge in a retaining wall for ten years; but its tenure is threatened by the invasive runners of *Spirea decumbens*, which has spread outrageously over a space of more than six feet, swallowing up a fine clump of *Campanula*. G. F. Wilson on its other flank. The worst of a wall-garden is that one cannot move precious things out of the way of aggressive neighbours. *Herbert Maxwell*

FORESTRY.

WORK IN HIGHLAND FORESTS.

THE Board of Trade Forestry Commission, through the medium of the leading officials of the Aberdeen and North of Scotland College of Agriculture, has organised large parties of lads from the leading secondary and higher-grade colleges and schools for forestry work in the Highland districts during the vacation. The work consists of shedding and peeling trees for pit props. The lads are under military discipline, and in some forests there are as many as 200 cadets in one encampment, their ages ranging from fourteen to eight or nine years. Many will in all probability pass through the Universities, and the experience they are gaining should inculcate in them an interest in the steps which are now being taken for the establishment of a forestry centre in the North of Scotland.

FIG. 11. TRUNK AND EXPOSED ROOTS OF ADAMSONIA DIGITATA.

found in the Bombay and Madras Presidencies, so it is possible seeds may have been brought by traders from Africa.

In fig. 10 is presented a general view with the River Ganges to the right; and fig. 11 gives an idea of the size of the trunk. In company with Mr. Head, I paid a visit to these trees, and

tion to the *L. C.* Canhamiana class. The broad sepals and petals are bluish white, the lip light violet with yellow lines from the base; the centre is tinged with orange. The flower was raised and sent by Messrs. Flory and Black, Slough.

CATLEYA CHARM.—Raised by Messrs. Saunders and Sons between *C. Percivaliana alba* and *C.*

Dusseldorfer Undine (intermedia alba x. Mossiae Wagener). It is but a slight variation from *C. Persivaliana* alba, but it will probably prove a freer grower. The chief departure is in the construction of the middle of the lip, the front lobe of which is more elongated than that of *C. Persivaliana*. The flower is pure white with chrome yellow disc to the lip.

BRASSO LACTEO CATELYA NEXUS. A flower of a cross between *Brasso Cateleya Diglyam* x *Mossiae* and *Laetia Cateleya Inguami*. *L. Dayana* x *C. Doyana* are also present by Mr. H. Haddon, Orchard grower to Mrs. Bischoffheim, The Warren House, Stamford, where it is flowering for the first time. It is of medium size, the *L. Dayana* in its composition having tended to restrict the expansion of the lip. The whole flower is tinged with blue over a white ground, the petals and lip being veined with dark rose. The lip, which is folded over on the side lobes, is very much undulated and fringed at the margin.

OBONGLOSSUM NAISALIA O. THOMASIANUM x *O. PERCULUM*. Mr. H. Haddon also sends a flower of this attractive *Obonglossum*. Although the *O. Ferdinandi* x *O. Thomasiannum* is not very evident, the record appears to be correct. The flower is like an ordinary *O. crispum* in form, the greater part of the surface of the sepals and petals being traced and blotched with light color, which displays conspicuously on the backs and the fronts of the segments. The lip, which is rather narrow, is white, with brownish red base and yellow crest, with radiating red lines at the sides.

ON THE TAMAR RIVER.

ON a bend of the Tamar River, in the beautiful valley through which it flows, stands the ancient Ship Inn, surrounded by the box houses that comprise the hamlet of Morwellham. It was to reach this beautiful spot and make the acquaintance of Mr. A. J. Bliss and his seedling lilies that I left Tavistock one morning in early June and drove through that delightful part of Devon.

We had first to pass through the valley of the Tavy, and as we slowly climbed to the ridge beyond, behind us, and above the picturesque-looking town, we had just left, high on the skyline in dim and misty fading masses stood Dartmoor, the most cherished and picturesque part of Devon, and, as it always seems to me, a desert complete in itself and apart. Away to the left in the far distance was the range of hills above Launceston. Pausing for a moment before descending to the next valley, the mind was lost in the wide sweep of country unfolded to the eye. Here was no evidence or sound of war, and the spirit of man was caught up in the beautiful panorama now spread out. A great film from nature that no cinema could ever reproduce.

Once again we began to slip between the wooded hills, the vegetation in many places now covering up the disfiguring signs of the recent copper and other mines of which the whole countryside is full. In clearings on the hills, at a sharp angle, warm slopes are utilized for large plantings of early Potatoes and Strawberries, for which the district is famous.

The road still descended, until very abruptly we seemed to be shot out on to the old quay of Morwellham and before the ancient Ship Inn. Here now all is still, and it seems as if a deep sleep had fallen on the place that some fifty years ago teemed with life and shipping. Then the copper mines were in full swing, making this ancient hamlet famous with its activities of life connected and bound up with the deep exploration of the soil. These have all passed away, but I seem to think that the activities of Mr. A. J. Bliss, which are mental more

than physical, and which are expressed through the medium of the soil, will once again make this little corner of glorious Devon famous, at least among garden-lovers.

Mr. Bliss's interest in the *Daffodil* is well known, especially among the Kentish rascals. Just before my visit he had been very active in catching the *Daffodil* Fly, having netted it in goodly numbers, much to his surprise, believing he had previously exterminated it. Fortunately for him, all his best seedlings were rearing in a gigantic apparatus, resembling one of a very large meat safe. Many hundreds of seedlings in beds testified to his devotion to the *Daffodil*. Mr. Bliss, it may be remembered, was one of the founders of the Kentish *Daffodil* Society, and it was encouraging to learn that he is of opinion that the "daffodil" trouble may be dealt with successfully.

But the lilies were my chief concern. In a large envelope several hundred clumps of seedlings were in full flower, the result and selection of many years of patient and careful work. To the owner they were as children, he knew each by name or number, its parents, and many other points of particular and individual interest. The quiet enthusiasm and knowledge the rascal showed for his children reminded me in many ways of the late Sir Michael Foster. It is not often you meet with such intimate knowledge and subtle deal liking.

In this quiet spot in Devon for the last five years Mr. Bliss has raised a collection of Bearded Irises of great beauty and exceptional variety. It is impossible as yet to name or describe many of them. One of his aims is to raise a really red *Paluda*. He is well on the way, but still has a long road to travel before he reaches his goal. His "Donation" is a wonderful plant of enormous size and colour, a magnificent and glorified "Black Prince" is the best description I can give in a few words. Many new purple shades were to be seen, whilst his very pink, simpler forms were equally lovely. The improvement in the stems of *variegata* was evidenced by greater height, with lighter and deeper coloring. A much finer plant than *Caterina* was also noted.

The use of *Præpina* as a parent Egyptian *Phlox* of *Festiva* was clearly seen, and the old lines of grouping seemed to be more and more broken down. Well named flowers of color coloring on tall stems, more branching than formerly, are the common characteristics of these seedlings.

Mr. A. J. Bliss is very much a comely part of the world that I thought his many horticultural trials would be pleased once more to hear of him and his work, which is now confined entirely to *Daffodils*, *Iris*, and *Gladioli*. He grows nothing else, but devotes his whole time and energy to the improvement of these three families. Robert W. Wallace.

FRENCH NOTE.

THE BRITISH ARMY AND FRENCH AGRICULTURE.

THE genius for organization in the British Army is nowhere better illustrated than in the reconquered fields of France. Each British Army has an agricultural officer whose business it is to devote himself to the agricultural organization of the land in the occupation of that army. Associated with him is a French agriculturalist, who also acts as an interpreter. Together they visit the mayors and the farmers, receive their requests for, and supply, labour. In illustration of the results that have been achieved, M. Thomassin, at a recent meeting of the Academy of Agriculture (June 15, 1917), mentioned that from March 10 to May 5 one army alone had supplied 41,000 days' manual labour and 2,000 days' horse labour.

THE POLLINATION OF CHERRIES.

THE infertility of Cherries has been much discussed during recent years, and the opinion is now very generally held that it must be attributed to the sterility, partial or complete, of certain varieties, and the need for cross-pollination. The problem is being attacked by experiments under glass, laboratory experiments as they may be termed, and field observation. A good example of the latter method is seen in Mr. G. P. Bery's paper in the June number of the *Journal of the Board of Agriculture*. Taking five commercial varieties, he has studied their behaviour in many parts of Kent, and collected some information of great interest.

While such work requires to be confirmed by repeated and independent observation, there is no doubt that some of the evidence points very strongly to the fact that in certain cases cross-pollination is very necessary. But as in all horticultural experiments, it is extremely difficult to isolate conditions in such a manner as to ensure that the results observed are due to one cause alone. There is an old saying in Kent that Cherries are "stuck on with innure," and it is certain that the older generation had a strong belief in the need for heavy manuring for cherries in established orchards.

Until some manual experiments have been tried, I should be reluctant to attribute all cases of infertility to lack of pollination. It seems to be rather too readily assumed that "self-sterile" Cherry is so under all conditions, whereas the influence of phosphate manures on this factor should give pause to those who hold such opinions.

Mr. Bery's paper brings out very clearly the necessity of preliminary work on the nomenclature of Cherries; it is useless to recommend certain varieties until some agreement has been reached as to their identity. For instance, the Turk or Turkey Heart is given as a synonym of Black Tartarian, and the growth described as upright and the leaves very large. The Turkey Heart of East Kent, whatever its right name may be, is quite distinct from Black Tartarian; it is a small leaved, late variety of upright growth, whilst the true Black Tartarian is a straggling grower, with a much larger and better fruit. To add to the confusion, Dr. Hogg describes the Turkey Heart as a Bigarone. We trust that it will be possible after the way to establish an experimental station where such problems can be solved as a stable nomenclature is a first condition of any progress in science. R. I. Bungeard.

THE ROSARY.

ROSA HIMALAYANA ALBA MAGNA.

THE above is the name given to a new hybrid pillar Rose, raised by Messrs. Paul and Son, Chesham. The parentage was *R. Himalayana* x *multiflora*. The seed parent is the Himalayan form of *R. moschata*. The reverse cross had previously been effected, and this is known in gardens as *R. polyantha grandiflora*. The new variety has semi-double, bush flowers, some fading to pure white, and freely produced in bunches. The stems from the base of the plant grow 20 feet long in one year, and ultimately lengthen to 30 feet. The plant may be grown as a pillar Rose, and is well adapted for training on free trunks in the wild garden. As a pillar Rose the supports should be at least 10 feet high, but the finest effects would be obtained by allowing it to grow to its full length, even if the stems were to sprawl over some object of moderate height, and give the profusion of flowers of which they are capable. J. P.

ON INCREASED FOOD PRODUCTION.

RUNNER BEAN SEEDS AS FOOD

Quite recently our attention was drawn to an article in a gardening paper warning the public against eating cooked ripe seeds of the white-seeded or other Runner Beans, as they might possibly be poisonous. In view of the national importance of our making use of any nourishing food of this kind that may be available, we forwarded the article, with samples of two varieties of Runner Beans and two varieties of Dwarf Beans, to the Food Production Department for analysis. The following is the report of the analyst:—

"On the 5th inst. I received from you four samples of Beans, marked respectively 'Dutch Case Knife Runner Bean,' 'Dutch Case Knife Dwarf Bean,' 'Ordinary White Haricot sold by Grocers,' and 'Scarlet Runner No Plus Ultra.' I have very carefully tested these four samples for the presence of a cyano-genetic glucoside, but in all cases with negative results. I have not, of course, examined the samples for other poisons, but I have fed the two uncooked 'Dutch Case Knife' samples to white mice without any ill-result.

(Signed)

"A. CHASTON CHAPMAN, F.I.C."

BOY SCOUTS AS FOOD PRODUCERS

At Eirkenhead, under the supervision of Mr. Frank W. Preston, the Scoutmaster, the Boy Scouts have prepared a demonstration plot of about 2,000 square yards which is worked entirely by the members of the troop. The same Scoutmaster has organised a body of lads to spray Potato plots at an inclusive charge for the use of knapsack sprayer, for material and labour.

OLD SEED AND NEW.

The irregular germination of many kinds of vegetable seeds is reliable evidence of the mixing together of old and new seed which took place before leaving the hands of seedsmen last spring; such action was probably necessary to eke out the supply, but those who purchased them should have been notified to that effect, and advised to exercise patience. With me, Beet and Turnip seeds were very much mixed, the old seed only germinating just when hope of a good crop was being abandoned. Leek seed has played me more false than any other kind. New Leek seed came up very badly at both sowings, under glass and in the open—so much so that additional plants have had to be procured from elsewhere; whilst old seed grown both under glass and in the open failed on truly. C. Turner.

SPRING CABBAGE

There is divided opinion amongst growers as to the best date on which to sow Cabbage for use in spring. No hard and fast rule can be laid down. For the home and southern counties I strongly advise two sowings, the first from the middle to the end of July, and the second about August 9. The seed should be sown thinly in drills, and if the soil is dry, the drills should be watered before sowing. Transplant the seedlings as soon as they are large enough for transplanting, and each plant when pricked out should have ample space to develop an upright, sturdy growth which will be well able to withstand the winter. In colder parts of the country Cabbage requires to be sown earlier and planted in September in order that the plants may be well established before growth ceases in autumn. Small, sturdy plants are far superior to larger plants with tender growth, and may usually be relied upon to pass through ordinarily severe weather without serious injury. In selecting plants, therefore, it is best to place the most advanced in rows together. If very early Cabbages are required, these plants may be expected to furnish them if grown in moderately

rich soil and afforded a somewhat sheltered position.

The plants for the main crop should undoubtedly be put out fully in the open in firm, fertile, but not over-enriched, soil. In such conditions they will grow slowly, but hardily. Cabbages never grow well on poor land, but the plants sown out now will succeed admirably on ground that has been liberally manured for a previous crop. Having prepared the ground well, either by forking or digging, very light hand should be made firm by treading in dry weather. Treading will not only consolidate the particles of soil and reduce rapid evaporation of moisture, but it will assist the free formation of fibrous roots.

The rows should be made 2 feet apart, and the plants put 18 inches apart in the rows. Some growers, desirous of securing an early cutting of small-hearted Cabbages, place the plants 1 foot apart in the rows, with a view to cutting out every alternate plant before they become so large as to spoil one another.

The seedlings should be watered the day previous to planting them, and each plant should be carefully lifted with a good ball of soil. The small plants may be left in the beds or dibbled in 4 inches apart, to remain for the winter, and be planted out in spring. After a severe winter there are often many blanks in the rows, and the surplus plants are useful to make good the losses. As a deterrent to slugs, scatter newly-slaked lime or soot about the plants soon after they are planted. Small plants soon suffer seriously from three pests, which attack the soft stems and riddle the leaves.

When the young plants have become established, hoe the soil frequently in dry weather. Hoeing has great value; it is an aid to growth, a disturber of slugs, which hide in the soil under the lower leaves, it warms the ground by admitting air, and keeps down weeds. Rich, stimulating food applied to Cabbages during winter may prove harmful, but after severe frosts are over the crop cannot be too much encouraged by feeding. Dressings of soot, nitrate of soda, and applications of liquid manure, guano, and other stimulants, are all excellent, whilst frequent hoeings to render the surface soil loose will favour rapid growth. Should wet weather prevail, and hoeing not be feasible, the soil can be pulled over with a reversed fork or scratcher, and this, though it may not be of much use for the elimination of weeds, will stir the manure into the soil. The applications of manure may have to be repeated if growth is slow. The following varieties are to be strongly recommended: Harbinger, April, Flower of Spring, and Webb's Emperor. James A. Price.

POTATO SPRAYING BY MOONLIGHT

It is reported from various districts that gardeners and holders of allotments are taking advantage of moonlit nights to spray their Potatoes. In some places there appears to be a scarcity of wooden receptacles in which to mix the copper sulphate; but generally, it is sug, gested, empty oil tins or beer barrels, well cleaned, or lard boxes from the local grocer can be obtained, and will serve all practical purposes. During the past week the Potato crop growing in the Mall has been sprayed by representatives of the Food Production Department.

RHUBARB

This useful plant needs a little extra attention at this time of the year. The leaves are so arranged that most of the rainfall is conducted away from large specimens, and the plants are apt to get dry at the root before other vegetables suffer from lack of moisture. Liquid manure should be given freely, or, in wet weather, a concentrated fertiliser should be applied and lightly forked in the soil just underneath the leaves. Whatever stimulant is applied, it should be rich in nitrogen to favour strong growth, which will ensure a better supply of leaves in the spring. W. H. Dicks.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. Arthur J. DAVY, Alberts Wood, Godalming, Surrey.

STRAWBERRIES.—Strawberry plants can now be freely layered for making new plantations, the earliest runners having been already removed for potting. The best layers are those obtained from year-old plants, which have attained their full vigour. In any case, no plants should remain in the ground more than three years. A good plan is to make one new bed and not destroy the oldest each year. Plants of Royal Sovereign which were used for forcing, and have now been planted out, should produce a few dishes of fruit in the autumn; other varieties will also yield an autumn crop if the plants are clean and healthy. The ground to be used for a new plot should be well dressed with manure, the quantity varying with the nature of the soil. Ground formerly used for Onions, and well enriched for that purpose, makes a good Strawberry bed, and so does a cleared Pea plantation. The sooner the plants are put out, when once they are rooted, the better, so that it is a good thing to keep a little ground in reserve for this purpose.

LOGANBERRIES.—Loganberries and other fruits of a similar nature should be pruned and tied, and given a good soaking with manure water. A mulch, after watering, will also be beneficial.

GOOSEBERRIES.—The later varieties of Gooseberries should be carefully netted with wasp-proof material.

PEARS.—The fruits of Pears should by this time have received their final thinning, but in isolated cases, especially where the fruits are borne in clusters, some may yet be the better for the removal of others which are crowding them. The size of the fruits of the different varieties should be borne in mind, and more room allowed for the larger kinds than for the smaller. Cordons trained trees on Quince stock will require ample moisture at the roots, especially those growing in shallow soils, and a good drenching from a sewerage tank will do much to improve the colour and flavour.

GENERAL WORK.—Fruit picking should now be proceeding apace, and those fruits not required for immediate consumption should be preserved. Be careful that all trees are sufficiently hoisted to prevent injury to the swelling wood. Keep long shoots secured to the walls. If signs of aphids are perceived, spray the young shoots at once with an insecticide.

THE KITCHEN GARDEN.

By J. DENN, Foreman Royal Gardens, Windsor.

CARROTS.—There is still time to sow stump-rooted Carrots to come into use during March and April. They can be allowed to remain in the ground throughout the winter. Model and Monument keep their colour well, and are reliable varieties. Young Carrots sown a month ago are well through the surface, and must be carefully thinned. Dust frequently with soot during showery weather, and keep the ground free from weeds by the frequent use of the Dutch hoe between the rows.

PARSLEY.—A sowing of Parsley should be made in a sheltered position for use during winter and spring. As soon as the plants are a few inches high they should be cut close to the ground, so that fresh and stocky growth may be produced. If a cold pit is available, a sowing may be made now for use during rough weather in winter. This may be cut over several times during the autumn to induce new growth. The lights should be left off until winter. Parsley will benefit by light dustings of soot and a plentiful supply of water.

SEAKALE.—Plants intended for forcing in winter should be encouraged to make quick,

clean growth. Apply a good dusting of soot during showery weather, and a month later a dressing of some approved artificial manure. If dry weather sets in, a plentiful supply of water should be given. Clumps of Seakale which are intended for forcing in the open should also receive attention. Remove all small growths, so that nothing but strong crowns remain. Manure water may be freely supplied during the autumn, especially if dry weather prevails. Keep the ground free from weeds.

TOMATOS.—If seeds were sown a month ago, young Tomato plants should now be ready for potting into 3-inch pots. A compost of two-thirds loam and one-third sifted leaf soil, with a sprinkling of sifted lime rubble, will be suitable. Pot carefully, and place the plants in a close, cool pit until fresh growth commences, after which ventilation must be applied. Water carefully until the roots are well round the pots, and at this stage shift the plants into 6-inch pots and grow them quite close to the roof-glass with plenty of ventilation. Plants producing ripe fruit must be given a good supply of liquid manure. Do not allow the fruits to remain on the plants after they are ready to gather, but rather pick them before they are quite ripe. Most of the side-shoots should be removed as they appear.

SUCCESSIONAL TOMATO IN POTS. As soon as the pots become well filled with roots a top-dressing of loam and artificial manure should be applied and made firm on the surface of the soil, after which water should be applied through a rose, so that the surface dressing may not be removed. Pinch all side shoots from these plants and ventilate freely.

WINTER GREENS. Continue to plant Late Broccoli and other hardy vegetables as the ground becomes vacant. As time advances a little less sowing will be necessary for such plants as Christmas Cabbage, Coleworts, and Savoys, as these can hardly be expected to grow to their full size. Late plantations of Brocks and Turnips may prove useful in spring. See that all available space is cropped with some useful vegetable before the season is too far advanced.

LETTUCE.—Fortnightly sowings of Lettuce must now be made to secure a continual supply throughout the autumn. Sow thinly and keep the ground free from weeds.

FRUITS UNDER GLASS.

By JAS. HENDER, Head Gardener at Gundersbury House, Aveon, W.

NEWLY PLANTED VINES. Give every possible attention to vines that have been planted recently, and make the best use of the sunshine by closing theinery early. Keep the atmosphere humid. Slight warmth in the pipes is beneficial towards the evening and through the night when the weather is changeable. Encourage the leaders to make a good growth by pinching the laterals for another six weeks, if the canes are not too well advanced. Give strict attention to watering, for the roots must not suffer from drought. For syringing, use water containing soot, as already advised in a previous calendar. If the syringe is used freely insects will not be troublesome.

PERMANENT VINES.—If there are only a few bunches remaining on the vines, the Grapes should be cut and placed in bottles in the fruit store. This will permit of a thorough syringing of the house to cleanse the vines from insect pests, and especially red spider. For this next, mix a little sulphur in the water for syringing, which should be done vigorously. Inside borders may need watering, but if the border is outside moisture will scarcely be needed. Should there be any tendency to make fresh growths, it will be well to allow them to develop to a moderate extent. Ventilate theinery fully both by day and night. Do not permit other plants to remain in the house. Damp the floors and the border frequently. An application of concentrated vine fertiliser is advisable after a copious watering with clear water.

PINEAPPLES. The Queen Pineapple should now be at its best from the batch of plants started into fruit in the spring, and these should supply fruits of good quality until early

October. From thence onwards more reliance must be placed upon the varieties Cayenne and Charlotte de Rothschild, which, if induced to show fruit during July, will develop good specimens in the late autumn. As the fruits of the earliest Queens are cut, care must be taken to secure a sufficient number of suckers, potting the greater number towards the end of July. At the same time, while the Pine pits are being rearranged, it is a good plan to put up all that are required to fruit early next season into their fruiting pots, which need not be of more than 12 inches diameter. Firm potting is essential. Use the best turfy loam in a rough state. If the loam is not quite first-rate, add about one-third of rough fibrous peat. The only other ingredient needed is finely sifted mortar rubble. Thoroughly cleanse the walls and woodwork, and examine, and, if necessary, repair, the piping used for bottom heat. For plugging, spent bark from tanvards is the best medium. After all the plants are arranged, keep the house warm and close it early. Do not shade the plants.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLEMAN, Bart., Gatton Park, Rogate.

EPIDENDRUM VITELLINUM MAJUS.—The winter-flowering variety of this cool-house Orchid should be repotted or top-dressed when new growth commences. Use shallow pans, provided with ample drainage, and stand them on the stage, or suspend them near the roof-glass in a light, airy part of the Obolito-glasshouse. Afford water sparingly during the early stages of growth, but when root action is most vigorous give liberal supplies of moisture at the roots until the new pseudo-bulbs are completed. During the resting season afford only sufficient water to keep the pseudo-bulbs firm.

EPIDENDRUM PRISMATOCARPUM.—As plants of this species pass out of flower they should be given attention at the roots. Specimens that have become pot-bound, and have grown over the sides of the pot, should be taken out. Cut away the old pseudo-bulbs, leaving only two or three behind each leading growth, and place several together in moderate-sized pans. Make the soil firm around the rhizomes, arranging them so that two or three of the leading growths point to the centre, to make a well-balanced specimen. Plants that do not require repotting will be benefited by having some of the old material removed from the surface and being given a top-dressing. For a few weeks after repotting, keep the soil rather dry, but whenever moisture is applied give a thorough soaking, taking care that water does not lodge in the centre of the young growth. The plants grow well in the coolest and lightest part of the Cattleya house.

EPIDENDRUM BICORNUTUM DIACRUM BICORNUTUM. Plants of this species and its many hybrids will soon be making fresh growth, and as soon as new roots develop from the base the plants may be repotted or re-surfaced. Ordinary flower pots are suitable, filled to half their depth with drainage material, as during their growing season liberal supplies of water at the roots will be needed. At the same time it is essential that the soil is kept in a sweet, porous condition. After removing the plants from their pots, cut away any useless pseudo-bulbs, retaining only two or three behind the lead. Those cut off may be utilised for propagating purposes. *E. bicornutum* grows best if placed near the roof-glass in a high temperature and moist atmosphere. A suitable compost for all the above-mentioned plants consists of three parts Osunda or Al. Filix, and one part Sphagnum moss, with a moderate addition of crushed crocks to ensure the free passage of water.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTHMOKE, Eastwell Park, Kent.

RHOODOBENDRUM INDICUM (SYN. AZALEA INDICA). Plants of the Indian Azalea have completed their growth, and should be placed out of doors for the remainder of the summer. Plunge the pots in a bed of ashes in order to keep the roots moist. Careful watering is necessary; the soil should never be allowed to become dust dry, whilst over-watering is equally harmful. Syringe

the foliage in the afternoons in bright weather, occasionally using clear soot water for the purpose, as this will serve to keep down attacks of thrips and other insect pests.

CAMELLIA.—Camellias growing in tubs or pots that have been flowered in the greenhouse and conservatory should be placed out of doors until the end of September. Similar conditions to those recommended for Azaleas will suit them, but if the plants have been standing in a shady house care must be taken not to expose them too suddenly to full sunshine and open air conditions, or the foliage will be damaged. They should be first placed under trees, and afterwards moved to a partially shaded situation until the foliage has hardened.

CHRYSANTHEMUMS.—Chrysanthemums will require more water from this date, and should receive strict attention in this respect. See that the stakes are secured firmly to a strained wire, to prevent the plants being blown over in stormy weather. Keep a sharp watch for aphids, and if any of the insects are detected dust the plants with tobacco powder or spray them with an insecticide. Attend regularly to the disbudding and stopping of the shoots. When the pots have become filled with roots, light top-dressings should be given and a moderate amount of stimulant to build up firm, healthy wood.

ABUTILON SAVITZII.—This Abutilon is a very satisfactory greenhouse plant for the amateur or small grower. The delicate green and white foliage blends well with the colours of the flowers. Abutilons are very easy to grow, and the species under notice gives good results in quite small pots, and is thus of much value for decorations. Cuttings strike readily in a warm propagating pit. When rooted, they should be potted on as required, and grown in a light position near the roof-glass. Pinch out the points of some of the shoots to obtain bushy specimens. Old plants that have become leggy or untidy should be cut fairly hard back and kept somewhat drier for a few weeks. They will then break into growth all over the stems, and if potted, will quickly form useful specimens. Do not use rich soil; a mixture of plain loam and leaf-mould with a little sand is all they need.

THE FLOWER GARDEN.

By W. J. GUYSE, Gardener to Mrs. PEMBERTON, Keele Hall, Staffordshire.

PANSIES AND VIOLAS.—Pansies and Violas raised from seed sown now on a partially shaded border will make sturdy plants by October, and such plants usually withstand the cold of winter better than those raised earlier. Use rich, friable soil, mixed with wood ash, or the ash may be scattered in the drills. Sow the seed thinly in rows made 12 inches apart and spray the seed bed each evening with tepid water. When the young plants are large enough to handle, transplant them in reserve beds at a distance of 6 inches apart in rows 12 inches asunder. Use tepid water for watering.

BOX HEDGES.—Provided the hedges are trimmed now, they soon make new growth and regain their fresh appearance. Very sharp shears are necessary to trim hedges of Box, Yew and similar close-growing plants. The work is best done in showery or dull weather.

LILIUM. Liliams must be staked before they are too far advanced. Insert the stakes a reasonable distance from the stem, or the bulbs will be penetrated. Keep the plants clean by occasional syringings of insecticide. Place top dressings of some rich compost round the base of the plants to encourage surface roots. Liberal supplies of water are necessary during dry weather, and a little fertiliser occasionally, manure, or soot placed in the water-can will be beneficial.

DARWIN AND MAY-FLOWERING TULIPS.—The bulbs placed in reserve beds to make room for the summer bedding plants should be lifted without delay. Bulbs of all descriptions will be scarce this coming season. The majority of the largest bulbs will flower next year, and may be used in the spring bedding scheme, but the smaller ones will be best planted in reserve quarters, and given liberal treatment. Spread them thinly in boxes after they have been dried and graded, and place them in a cool, airy shed until required.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

EUCALYPTUS VERNICOSA.—I see in *Gard. Chron.* of April 7, 1917, p. 145, a statement that *Eucalyptus vernicosa* has apparently never been introduced into this country. It has been growing here since 1909, and forms a shrub 8 feet to 10 feet high. It is one of the hardest of Eucalyptus trees, so far as I can judge. *K. G. Loder, Leamington, Warwick.*

THE HOUSE SPARROW (see Vol. LXI., p. 264, and Vol. LXII., p. 1) — I often condemn this bird while living at Belvoir Castle. No sooner were Peas above the ground than sparrows commenced eating them, and they did the same with Sweet Peas. But here in Surrey I find the house sparrow is of much better behaviour. The bird clears Winter Mistletoe caterpillars from Apple trees, and does not touch the buds of Peas. There is no doubt about its being the house sparrow in this case, and I am pleased to be able to say a good word for him in confirmation of Mr. Stanbury's note on p. 264. The most useful birds in the garden at Belvoir Castle were red linnets, thrushes, both common and muskell, robins, martins, and swallows. *J. H. Davis, Westdown, Hants, Salisbury.*

— I can assure *Southern Gardeners* I made no mistake when I stated that the house sparrow destroyed more fruit tree pests than all the other birds combined. There are fruit trees in front of the putting house office and cottage windows, and I am up and down the walks from early morning till late at night, so I have good opportunities of seeing what birds are in the trees and what they are doing. I have seen as many as ten or a dozen sparrows in a tree searching for young caterpillars among the young fruit and foliage. I have seen them opening curled leaves and picking out the young caterpillars, and later I have seen them hanging on to Plum branches picking aphides from the undersides of the leaves as fast as they could. Sparrows are often blamed for what they do not do. When they fly up from the ground where they have been picking the seeds from Chickweed the first thing they do is to wipe their bills on young shoots and twigs, and at a little distance they appear to be picking buds. The sparrow feeds its young entirely on insects and young caterpillars from the time they hatch out till they leave the nest. *J. H. Stanbury, Mount Felix Gardens, Walton-on-Thames.*

AN APPEAL TO THE SEED TRADE.—In reply to *Seedman*, p. 250, Vol. LXI., I ought to say, it is time we had someone to protect our interests. Men manage to get into the trade who have no qualification whatever. This all tends to lower the standard of wages of experts. We could do a great deal to help the boys to with draw when they come home. Would those interested, including *Seedman, Gloucester*, like to exchange views? *L. G., Portland Road, Nottingham.*

GRAPES WITH LARGE SHOULDERS. I have for many years raised the berries in the shoulders of small bunches of Grapes, particularly of Black Hamburg and Muscat of Alexandria in the way recommended by Mr. Hudson on p. 253, Vol. LXI. But it cannot be done with all varieties. Muscat Hamburg, for instance, must have the shoulders "laid up." And in the case of the larger bunches of other varieties, it is important not to do them also, if for no other reason than that of saving the strain by taking part of the weight of the stalk. Sometimes I introduce a string under two of the shoulders to lessen the whole weight. The effect is apparent in a slight increase in the dimensions of the berries. In a little pamphlet written many years ago by the late Mr. Dobbie (originator of Dobbie and Co.), the author remarked on the effect of tying Peas in a similar manner had in increasing the size of the fruits. The practice is, of course, followed with Melons, Apples, and other fruits. *B.*

FRUIT PROSPECTS. Black Currants, which were very backward before the last week of June, coloured suddenly, so that picking was begun on July 2. The crop, on the whole, is a fair one.

Early Rivers, Monarch, and President Plums show fair to full crops. Victoria and Black Diamond varieties light to full ones, and Czar and Pond's Seedling very small crops on the whole. Trees of Belle de Louvain, in their seventh season, have not blossomed yet. Apples show thinly on many trees, the blossom of which at first seemed to be entirely destroyed by caterpillars. On most of my oldest trees there is a good crop, particularly of Mr. Gladstone, Beauty of Bath, Duchess of Oldenburg, Early Julyan, Queen, Bramley's Seedling, Royal Jubilee, Charles Ross, and Lane's Prince Albert. The last-named is fruiting well on most young, as well as on comparatively old trees, and is the best all round cropper of the season in my orchards. Cox's Orange Pippin has a fair crop on comparatively old trees, but only a sprinkling of fruit on some planted twelve years ago, though some younger ones are well loaded. Lord Grosvenor is bearing well where there was not a

but normal green-eyed examples of *Euonymus japonicus* were throwing shoots with foliage of a clear yellow of the Evening Primrose hue, giving the bushes the appearance of bearing flowers. The plantations on the Broadstairs "front" consist very largely of the ordinary green *E. japonicus* with an intermixture of several other coloured shrubs. Many individuals of these variegated varieties have produced shoots and bear bearing leaves, representing reversion to the original green. But what is less common, so far as my experience goes, the normal green condition is prolific in colour sports in this year's growth. I do not mean by this that there is not evidence of such sports of greater age, but growths of this nature are conspicuous this season, and total yellow sports predominate. Others there are with central yellow variegations; some with marginal yellow bands; others again with white variegations. *Euonymus japonicus* is well known as one of the most plastic bud sporters

FIG. 17. THE EARLY BLOSSOMING OF A WINTER PEACH, GROWN WITH THE BUDS WITH PINK SPORES.

large crop of peaches. Dominant and partial Worcester Pearmain is one of the best. Worcester is a good tree and has a very possible success in fruiting here. Victoria Plum, except on a few old trees which did not fruit last year, has scarcely a sprinkling of fruit. Norfolk Beauty is a failure, and a large expanse of Beauty of Bath, not over twelve years from the planting, still produce scarcely any fruit. Worcester King is nearly a failure. More than half the promised crop of Lord Derby has been ruined by the brown rot fungus. James Grieve is fruiting well in proportion to ages of trees. Gardeners are thick on trees the foliage of which has been ruined by caterpillars. *Southern Gardeners.*

SPORTING AND REVERSION IN EUONYMUS JAPONICUS. In a communication on the effects of frost and wind on vegetation at Broadstairs (*Gard. Chron.*, May 5, 1917, p. 146) I mentioned

among other green northern shrubs, but it is not, perhaps, so generally known that *E. radicans* is what is termed a juvenile condition of the same species. *E. japonicus* (*radicans*) is another eastern Asiatic plant exhibiting the same hereditary phenomenon, which is also characteristic of many elements in the vegetation of New Zealand and other countries. Under this opportunity of correcting my report on the injuries effected by the winter weather at Broadstairs to the extent of recording the fact that very few specimens of plants were actually killed, the South American *E. radicans* that appeared to be absolutely dead at the beginning of May soon put bud vigorously, and now show little traces of injury. *Chrysothamnum (Pyrothrum) frutescens* is the only common plant utterly exterminated, though *Yucca*, *Amelanchier* and nearly shared the same fate. *W. Belling Hensley.*

SOCIETIES.

ROYAL HORTICULTURAL

JULY 17.—The Drill Hall was well filled with exhibits on Tuesday last on the occasion of the fortnightly meeting, and many visitors were present. Numerous seedling Roses were exhibited, and several awards were made to new varieties by the Floral Committee and the National Rose Society. The national Carnation and Picotee Society's annual exhibition was held in conjunction with the R.H.S. meeting.

A moderate number of other novelties was submitted to the Floral Committee for award, and three Awards of Merit were recommended.

lifton blooms in boxes and American Pillar in tall stands.

The deep crimson, fragrant variety, H. E. Richardson, was conspicuous in Messrs. FRANK CANT AND CO.'S group, flanked by British Queen and Mrs. Amy Hammond. Messrs. W. AND J. BROWN had a most effective display of Roses, including tall bouquets raised above the general collection. Mr. E. J. HICKS had also a fine exhibit of Roses, and made a special feature of Princess Mary, Mme. E. Herriot, Queen of the Belgians, and the new C. E. Shea.

In addition to Perpetual Carnations, Messrs. ALLWOOD BROTHERS contributed varieties of the hybrid Dianthus Alwoodii, their new race of Perpetual flowering Pinks. The ALDER RIVER NURSERY staged a beautiful group of Lilliums.

There were few exhibits before the Fruit and Vegetable Committee, but one of these, from Messrs. BARR AND SONS, filled half the length of one table, and consisted of an attractive and educational exhibit of sixty-two dishes of vegetables. Peas, Carrots, Potatos, Tomatos, Cauliflowers, French Beans, and Marrows were especially well shown. The NEW ZEALAND COMMISSIONERS staged Jonathan and Stayman Winesap Apples. Mrs. BARRS again showed bottled fruits and vegetables. Mr. H. CLOSE staged a new Red Currant, named Littlecroft Red. The bunches and individual berries were of large size.

At the 3 o'clock meeting of the Fellows, Mr. WALTER EASTLEA gave a lecture on "Mildew Resistant Roses."

Floral Committee.

Present, Messrs. E. A. BOWLES (in the chair), John Green, W. J. Bean, Sydney Morris, R. C. Notcutt, W. G. Baker, G. Reuthe, C. R. Fielder, H. O. Jones, J. W. Moorman, John Dickson, John Heal, Chas. E. Pearson, Wm. Howe, C. Dixon, J. T. Bennett Pore, A. G. Jackson, Clarence Elliott, H. Cowley, Jas. Hudson, W. H. Page, J. Jennings, E. H. Jenkins, J. F. McLeod, Thomas Stevenson, George Paul, W. P. Thomson, and E. F. Hazelton.

AWARDS OF MERIT.

Sambucus racemosa plumosus.—An elegant shrub or small tree with slender, graceful branches furnished with an abundance of finely divided foliage, the divisions or leaflets often quite linear and with a few deep serrations. The tiny, coral-red fruits are borne in clusters on dark stems, forming a large, pendulous raceme. Shown by Messrs. PAUL AND SONS, Chesnut.

Rose Sanstar (see fig. 15).—A Hybrid Tea Rose of moderate size and good form. The colouring is a beautiful combination of gold and rich carmine red, the latter colour being around the edges of the petals and showing most in the bud state. It is a distinct Rose, and may be briefly described as an improved Queen Mary. Shown by Messrs. ALEX. DICKSON AND SONS, Newtownards.

Rose Irish Attergoun.—A vigorous, single-flowered Hybrid Tea variety, with shining, bronze-green foliage. The flowers are 3 to 4 inches across, golden-orange in colour on opening, and fading to golden-fawn and pink with age. The plant is very free flowering, but the petals are not quite so broad or of such stout texture as in some other singles. Shown by Messrs. ALEX. DICKSON AND SONS.

GROUPS.

The following medals were awarded to collections: *Gold Medal* to Mr. W. H. HOLLOWAY, Port Hill Gardens, Shrewsbury, for Sweet Peas, *Silver gilt Banksian Medal* to Messrs. PIPERS for Sweet Peas and border flowers, *Silver Flor Medal* to Mr. E. J. HICKS for Roses; Messrs. H. B. MAY AND SONS, for Ferns; Mr. L. R. RE'S SELLS, for Tree Ivies and shrubs; Messrs. BLACKMORE AND LANGDON, for Delphiniums and Begonias; Messrs. B. R. CANT AND SONS, for Roses, and to Messrs. FRANK CANT AND CO., for Roses, *Silver Banksian Medal* to the ALDER RIVER NURSERY, for Lilliums; Messrs. ALLWOOD BROS., for Perpetual Carnations and Pinks; Messrs. W. AND J. BROWN, for Roses; Messrs. R. HARKNESS AND CO., for Roses; and Messrs. WM. PAUL AND SONS, for Roses. *Bronze Flora Medal* to Mr. G. REUTHE, for hardy plants; and to Messrs. WM. CUTBUSH AND SON, for Perpetual-flowering Carnations. *Bronze Banksian Medal* to Messrs. J. CHEAL AND SONS, for hardy flowers and Dahlias; and the Rev. J. H. PEMBERTON, for Roses.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. secretary), William Bolton, E. R. Ashton, J. Wilson Potter, R. A. Rolfe, Frederick J. Hanbury, Arthur Dye, Fred K. Sander, Pantia Ralli, S. W. Flory, R. Brooman White, Walter Cobb, T. Armstrong, J. Charlesworth, and Chas. H. Curtis.

AWARDS

PRELIMINARY COMMENDATION

Odontoglossum Lillian (*Dora's Empress of India*), from Messrs. CHARLESWORTH AND CO.

FIG. 15.—ROSE SANSTAR.—PETALS CARMINE RED, SHADED WITH GOLD COLOUR AT THE BASE.

This Committee awarded seventeen medals to groups, including a Gold Medal to Mr. W. N. HOLLOWAY, for a fine group of Sweet Peas, which contained grand bunches of Aericola, Golden Glory (of wonderful colour), Hope, Audrey Croft, and Jean Inland. Messrs. PIPERS, Bayswater, also contributed a fine exhibit of Sweet Peas, including the beautiful Lavender George Herbert and the newer Sincerity and Ivory King.

Roses were a great feature of the exhibition. It cannot, however, be said that the Roses were, as a whole, up to the usual exhibition standard, and those from Irish growers showed evidences of long and delayed transit. Messrs. B. R. CANT AND SONS showed Mme. Edouard Herriot in good colour, and fine blooms of Golden Ophelia and Sovereign. Messrs. WM. PAUL AND SONS showed Mrs. Littleton Dewhurst (the white Lady Gay), Messrs. R. HARKNESS AND CO. staged fine exhibi-

tion blooms in boxes and American Pillar in tall stands.

The deep crimson, fragrant variety, H. E. Richardson, was conspicuous in Messrs. FRANK CANT AND CO.'S group, flanked by British Queen and Mrs. Amy Hammond. Messrs. W. AND J. BROWN had a most effective display of Roses, including tall bouquets raised above the general collection. Mr. E. J. HICKS had also a fine exhibit of Roses, and made a special feature of Princess Mary, Mme. E. Herriot, Queen of the Belgians, and the new C. E. Shea.

In addition to Perpetual Carnations, Messrs. ALLWOOD BROTHERS contributed varieties of the hybrid Dianthus Alwoodii, their new race of Perpetual flowering Pinks. The ALDER RIVER NURSERY staged a beautiful group of Lilliums.

There were few exhibits before the Fruit and Vegetable Committee, but one of these, from Messrs. BARR AND SONS, filled half the length of one table, and consisted of an attractive and educational exhibit of sixty-two dishes of vegetables. Peas, Carrots, Potatos, Tomatos, Cauliflowers, French Beans, and Marrows were especially well shown. The NEW ZEALAND COMMISSIONERS staged Jonathan and Stayman Winesap Apples. Mrs. BARRS again showed bottled fruits and vegetables. Mr. H. CLOSE staged a new Red Currant, named Littlecroft Red. The bunches and individual berries were of large size.

Hayward's Heath. A hybrid producing its first flower, which is of fine shape and substance, clear white, with light violet markings on the segments. *O. crispum* predominates in the general features, but its perfect form is derived from the very broadly ornate labellum of *O. Pescatorei*, descended through *O. Dora* (Lambeaunium x *Pescatorei*) and *O. Rolfeae* (Harryanum x *Pescatorei*) in *O. Lambeaunium* (*crispum* x *Rolfeae*).

GROUPS.

MESSRS. CHARLESWORTH AND CO., HAYWARDS Heath, were awarded a Silver Flora Medal for an interesting group, in which were good white Cattleya-Hosta, C. Warscewiczii Mrs. E. Ashworth, with six flowers, as shown at the previous meeting; good *Odontoglossums*, and *Laelio-Cat-thyas*, including a large and richly-coloured form of *L. C. Momus* (C. Octave Doim x *L. C. Rubens* Lambeaunium).

MESSRS. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells, were awarded a Silver Flora Medal for a fine group of showy *Odontoglossums*, *Odontiodas* and *Miltonias*, the last named including the handsome variety Frank Reader, and unnamed hybrids. The best *Odontoglossums* were *O. Armstrongiae*, with white ground attractively spotted with violet blue, and *O. Amethyst* Glehlands variety, which obtained the R.H.S. First class Certificate on Feb. 18, 1915. Among the seedling *Odontiodas* the most remarkable was *Oda*, *Cereus* var. *Figaro* (*Oda*, Charlesworthii x *Odm. excellens*), a very extraordinary variation from the original form, which was wholly light scarlet. The variety *Figaro* has the yellow ground colour of *Odm. excellens* (*Pescatorei* x *triumphans*), the showy markings of chestnut red colour indicating *O. triumphans*. The lip has a large chestnut red blotch yellow crest, and light margin.

Fruit and Vegetable Committee.

Present Mr. A. H. Pearson in the chair. Rev. W. Wilks, Messrs. F. Perkins, Edwin Beckwith, A. W. Metcalfe, George P. Berry, H. Somers Rivers, E. A. Bunyard, J. C. Allgrove, A. Ballock, W. H. Divers, Owen Thomas, Wm. Poppart, and A. R. Allan.

GROUPS.

The following medals were awarded to collectors:
Silver gilt Knight Medal to Messrs. BARN AND SONS, for vegetables; *Silver Bowl* to Messrs. BARN AND SONS, for Apples grown in the Dominion.

NATIONAL ROSE SOCIETY'S AWARDS—GOLD MEDALS.

Mermaid. A delightful single variety, with blooms 5 inches across, of a light yellow shade, deepening at the center, where the golden stamens add to the intensity of the colour. It is a hybrid from *Rosa bracteata* and a Hybrid Tea variety, quite hardy, of climbing habit, and has handsome, shining foliage. Shown and raised by Messrs. WM. PAUL AND SONS, Waltham Cross.

Elizabeth. A decorative and bolding variety, with rather small and (as shown) somewhat thin flowers. The colour is bright crimson, the outer petals darker than the inner ones. The variety appears to be free in flowering, but the foliage is not especially attractive; indeed, it was a little difficult to understand the award of a Gold Medal to this variety unless it has exceptional merit as a hedger, a matter not possible to determine from cut flowers. Shown and raised by Messrs. ALEX. DICKSON AND SONS, Newtownards.

The Queen Margaret. An exhibition and garden Rose of the Hybrid Tea class. The colour is very distinct, and may be described as bright cherry red; in some lights the shade assumes a vermilion tint. The flowers are full, of fair size, and slightly fragrant. The stems are strong, the foliage handsome and ample. It is the third Rose of the same name, which is continuing. Shown and raised by Messrs. SAMUEL MCGREY AND SONS, Portadown.

Mrs. George Marriott (see fig. 12). A large full-petalled variety of fine form and substance, and a suitable exhibition variety. The petals are cream-white, with a delicate flush of pink

that is most evident in the centre and in the younger blooms. It is one of the largest and fullest of the newer Roses. Shown and raised by Messrs. SAMUEL MCGREY AND SONS, Portadown.

Sunstar (see awards by the Floral Committee).

CERTIFICATES OF MERIT.

Mrs. Stewart Clarke.—A vigorous Hybrid Tea variety, and apparently with some influence of the Perpetiana type. The stems are very spiny, and the foliage is shining, deep green, and hardy some. The shapely flowers are rich, clear yellow, very attractive, and less flaunting than Bayon d'Or. Shown and raised by Messrs. ALEX. DICKSON AND SONS, Newtownards.

Pure. A hybrid Musk Rose, slightly perfumed. The semi-double flowers, from 3 to 4 inches across, are cream-white, with a central boss of golden stamens. It is a bedding perpetual variety, 3 feet to 4 feet high, and has dark stems and foliage. Shown by the Rev. J. H. PEMBERTON.

E. Godfrey Brown.—This Hybrid Tea variety is a rich, bright cherry-crimson colour, large petalled and of good form. The bloom is sweetly fragrant, and the variety has great promise as an exhibition Rose. Shown and raised by Messrs. HUGH DICKSON, LTD., Belfast.

Nancy. A handsome climbing Rose, of vigorous growth and free blooming. The leaves are deep green and shining. The shapely, single flowers are borne in erect clusters. The colour is deep, reddish rose. Shown by Dr. WILLIAMS, Harrow.

Mrs. H. D. Green. A charming garden Rose, and apparently a very free-flowering Hybrid Tea variety. The colour is delicate pink, with a light orange flush at the base of the petals, the latter tint also showing on the outer petals of unopened buds. Shown by Mr. WALTER EASTY.

Miss May Marriott. This beautiful golden-opic variety was fully described in *Gard. Chron.*, July 7, p. 3. It had a more decided orange tint on this occasion. Shown by Mr. TOM ROBINSON, Nottingham.

Edith. A large, white Hybrid Tea variety, with broad petals that make up a shapely bloom. Shown and raised by Messrs. SAMUEL MCGREY AND SONS.

Eunice Wright. A somewhat thin but extremely gorgeous Rose, that has orange-coloured buds, while the expanded flowers are rich golden-rose, of a very glowing shade. The dark green, shining foliage forms a handsome complement to the brilliant blooms. Shown and raised by Messrs. SAMUEL MCGREY AND SONS.

T. F. Cooper. A free-branching Hybrid Tea variety, with shapely blooms carried on stout stems. The broad-petalled flowers are of fair size, and the colour is bright sulphur yellow. The variety promises to be a good garden Rose. Shown by Messrs. HUGH DICKSON, LTD., Belfast.

NATIONAL VIOLA AND PANSY.

JULY 7. The annual exhibition of this society was held at the Botanic Gardens, Edglaston, Birmingham, on the 7th inst. The entries were in excess of those of the previous year, and the general standard of quality was higher. There were only two competitors for the Challenge Cup, and the exhibitors were almost of equal merit, but the first prize was awarded to Mr. J. BAYLOCK, Moseley, whose collection included five varieties of his own raising. Mr. J. A. PEARSON, Sparkhill, was the other competitor. The most successful exhibitor in the amateurs' classes was Mr. H. J. TANNER, Sparkhill, who won several first prizes. There were a number of honorary exhibitors, and medals were awarded to several non-competitive groups.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

JULY 9. The monthly meeting of this society was held at the R.H.S. Hall on the 9th inst. Mr. C. H. CURTIS in the chair. Two members withdrew interest amounting to £6 12s., and one member was allowed to withdraw £5 from his

deposit account. The sum of £10 19s. 8d. was passed for payment to the nominee of a deceased member who was killed in battle. The sick pay for the month on the ordinary side amounted to £65 5s. 7d.; on the State side to £15 19s. 2d.

Obituary.

WALTER A. VOSS.—We learn with sincere regret of the death of Mr. Walter A. Voss, the founder of the firm of Walter Voss and Co., Ltd. Mr. Voss, who had long suffered from heart trouble, died on Wednesday, the 11th inst., after an attack of influenza, followed by peritonitis. Mr. Voss built up his firm on the sound foundations of scientific accuracy, and the careful methods which he introduced into his business of agricultural and horticultural chemist have been followed by his successors, Mr. J. H. MAY, F.C.S., and Mr. WOODCOCK, with whom for some considerable time the direction of the business has rested.

G. T. BARGERY.—We regret to learn of the death of Mr. G. T. Bargery, representative for 50 years in the West of England of Messrs. Hurst and Sons, seedsmen, at his home, 17, Verney Place, Exeter, aged 73 years.

ROZAIN BOUCHARLAT.—We regret to announce the death, on June 12, of M. Rozain Boucharat, of Lyons. A generation ago his was a familiar name to chrysanthemum growers. Ecole de Lyon was probably the largest Japanese Chrysanthemum ever raised up to the time of its introduction in 1838. It was in the same nursery that the famous Mme. Gustav Desgranges was raised. Deceased, who was a prominent man in the Lyons world of horticulture, and a frequent attendant at Continental shows, was 63 years old. Chrysanthemums, Dahlias, and Pelargoniums were his specialities.

GUSTAVE FARGOTON.—We regret to announce the death, reported by the *Revue Horticole*, of Monsieur Gustave Fargoton, nurseryman, of Angers, France, a successful grower of Hydrangeas and other plants. As an exhibitor he won a number of prizes at French and foreign exhibitions, including the "prix d'honneur" in Paris, Orleans, and at other important centres. Monsieur Fargoton was an officer of the Order of Merit.

CROPS AND STOCK ON THE HOME FARM.

VETCHES FOR FEED.

WINTER Vetches sown as food for sheep and cattle are none too satisfactory, which means that seed will be scarce and dear next autumn. Mr. who can should save a plot for seed if but a few acres. Seed may be worth £1 per bushel, which means that a 20-acre plot would cost £40 to seed. Where the plant is thin it promises well to carry a full crop of seed pods.

ELECTRIFIED SEED.

In the near future we may be materially assisted in the production of increased crops by the aid of electricity, by a process of treating cereals and seed grain before sowing in order to render them more productive. I am testing a variety of Swede which has been treated by this process, and certainly the seed has a plump appearance, and is particularly bright in colour. I hope to be in a position to report favourably on the trial. In the case of cereals so treated if an extra 20 per cent. beyond the ordinary good crop of 48 bushels of Wheat per acre or 80 bushels of Oats can be obtained, the new method will be welcomed by farmers.

SUGAR BEET.

The root crop is growing splendidly where the soil is free from weeds. The plants should be allowed a distance of 2 feet, as they make much leaf. There does not appear to be much opportunity to use the roots this season for sugar production, but they are valuable for feeding cattle.

SHALLOTS.

Grown in bulk as a farm crop. Shallots in the past have been much neglected. The culture is

simple, and does not entail much labour. Choose a trailable, leamy soil, free from stones, and let the ground be well ploughed, adding a fairly good dressing of manure in the autumn. Now is the time to lift this season's crop. Place the chaves in a sunny position until they are thoroughly dry, and then store them in a cool, dry room or shed. The land they occupied may be cropped with Cabbage for cows or be manured and prepared for Spinach to be sown in August.

MARROW KALE

This new French or Marrow stem Kale is a cross between Thousand-headed Kale and Kohl Rabi. It produces thick, edible stems of a Marrow-like nature, growing 4 feet high, clothed with an abundance of leaves, which in the autumn provide much food for cows or sheep. The stems can be stored safe from frost for food through the winter.

The culture required is similar to that for ordinary Kale or Rape. The seed should be sown in drills, and the seedlings thinned freely and kept free from weeds. Marrow Kale is a valuable food for early lambs.

MUSTARD FOR WHEAT.

Mustard is largely used as a preparation for Wheat in the southern counties, especially where sheep are not kept in large numbers, or where it is not convenient to feed them on certain fields. Mustard grows quickly, and is useful for supplying a second green crop, which is an excellent method of growing good Wheat. For instance, a crop of Swedes, Rape, or Kale fed off by sheep, ploughed, and sown with Mustard about the middle of August, at the rate of 20 lb per acre, will be ready to plough in late in September or early in October. *E. Melquar.*

TRADE NOTE.

BARR AND HUNTER.

The firm of Barr and Hunter, carrying on business as nurserymen, seedsmen, and florists at 10 and 41, Galloway Street, Maxwell Road, Finsbury, has been dissolved as on June 30, 1917, by mutual consent, and the residual business of David Barr, one of the partners. The business will continue to be carried on by David Hall Hunter, under the same name of Barr and Hunter.

ENQUIRY.

CAN any reader inform me of the origin of the "Cropper" Broad Bean, and the name of the raiser? *J. W. Y.*

ANSWERS TO CORRESPONDENTS.

BEET: *W. E. P.* The specimen resembles *Stigota* *Beet*; the drought which took place during the spring is doubtless responsible for the plant having bolted.

DAPHNID PESTS DISEASED: *M. H. Jersey.* The Daffodil bulbs are affected with both the large Narcissus fly (*Merodon equestris* (see fig. 14) and the small Narcissus fly (*Emenusa strigatus*) in the larval stages. Bulbs affected with the former pest are hollowed out, and infested bulbs can be detected by pressing the neck with the thumb and forefinger. If the neck is soft and will not resist the pressure, the bulbs should be regarded as unsound, although when the grubs are young it is difficult to be certain of their presence. All bulbs showing damaged basal plates should be discarded and destroyed. No complete remedy is known, but it is said that by soaking the bulbs in lukewarm water for 24 to 48 hours the grubs are forced out of the bulbs and "drowned." The fly is two-winged and hairy, so that it can be readily distinguished from honey and humble bees and drone flies, although in general appearance it resembles them. The *Merodon* flies appear in spring and early summer, and should be caught with a butterfly net. Bulbs infested with the grubs of the small Narcissus fly are rapidly reduced to a decaying mass, and generally contain from twelve to twenty yellowish brown larvae, possessing a red coloured

horny tubercle at the tail end. All bulbs which are rotten or soft should be destroyed. We do not think the moth to which you refer is the cause of any damage to the bulbs.

DRILL HALL, BUCKINGHAM GATE: *E. J. H.* The Drill Hall of the London Scottish Regiment, in which the R. U.S. fortnightly meetings are now being held, is situated in Buckingham Gate, a road leading from Victoria Street, Westminster, almost opposite the Army and Navy Stores. The lecture on mildewy Roses to which you refer may be the one given by Mr. Earler on Tuesday, the 17th inst., entitled "Mildew Resistant Roses."

FIGS DISEASED: *H. T. S.* The Fig is covered

FIG. 14. THE NARCISSUS FLY (*EMENUSA STRIGATUS*) IN ITS LARVAL STAGES.

(1) THE PEST IN THE BULB; (2) A LARVA EMERGING; (3) A PUPA EMERGING; (4) INFESTED BULB (NOT SHOWN).

with the fructification of the fungus *Botrytis-emerea*. This pest lives on dying or decaying vegetable matter, therefore do not allow any decaying vegetation in the vicinity of the Figs, and remove all infested Figs before the disease spreads. Keep the air of the house as dry as possible.

INSECTS: *Constant Reader.* The Red Currant leaf has present on it cocoons of a moth, probably the Gooseberry moth. You should be able to prevent attacks of red spider on your Peach trees by syringing with clear water; this pest spreads rapidly when much fire-heat is used, and the air is excessively dry. If the present infestation is very severe, either place some flowers of sulphur in the water used for syringing, or dust a little of the powder on to

the leaves. The large larva you send is that of one of the Hawk moths.

NAMES OF PLANTS: *D. V. 1.* *Lycium chinense* (Chinese Box Thorn); 2, *Bromus mollis* (Soft Bromus Grass); 3, *Bromus stertilis*; 4, missing; 5, *Lolium multiflorum*, sometimes named *Lolium perenne multiflorum* (Italian Rye grass); 4, *Bordum murinum* (Wall Barley); *C. H.* 1, *Genista tinctoria* (Dyer's Weed); cutting down the tops of the plants before they seed and dressing the turf with a nitrogenous manure, such as sulphate of ammonia, are the best methods of destroying the weed.

B. W. *Rubus nobilis*.—*Dr. Rawson*, A. Veronica Traversii; B, *Deutzia crenata* var. *flora plena*; C, *Linaria purpurea*; D, *Sidaea spicata*; E, *Erigeron speciosus*; F, Rose "Rubin."—*Florence Rice.* *Elaeagnus multiflora* (syn. *E. longipes*). The fruits are edible when made into a jelly, which is said to be equal to Guava jelly.

NITROGEN IN RAIN-WATER: *C. L. C.* The quantity of nitrogenous matter present in rain-water is very small; it is derived from the trace of ammonia present in the air, which is dissolved and carried down by the rain as it falls. You ask whether you can "add nitrogen" to the water used in watering plants. Liquid manure made from animal dung is itself highly nitrogenous, and guano, which is also rich in nitrogen, sod, nitrate of soda, and nitrate of potash (saltpetre) can all be dissolved in water, and applied in this way direct to the roots.

ONIONS: *G. W. B. G.* The plants are attacked by Onion mildew (*Peronospora Schleidenii*). Next season spray the seedlings with Bordeaux mixture before the mildew has attacked the leaves.

PAEONIES DISEASED: *H. L.* The fungus attacking the Paeonies is *Botrytis Paeoniae*, the cause of the drooping disease of Paeonies. Discontinue mulching the plants with manure, as damp conditions favour the spread of the disease.

PEAR LEAF ATTACKED: *J. G.* The tree is infested with the Pear Leaf Blister Mite (*Phytoptus pyri*). Gather and burn all the infested leaves, and spray the trees at once with paraffin emulsion. In winter, spray the trees with lime sulphur wash. The pieces of "scab" are too fragmentary to identify; next year, if they appear again, send some whole leaves.

POTATOS UNSOUND: *J. Ludg.* The Potato plant is attacked by *Hypochymus Solani*, the "collar rot" fungus. It is not a serious disease as a rule, but withered plants should be pulled up and destroyed in the garden fire.

POTATO: *W. P. L.* We do not recognise the variety of Potato.

TWIS CUCUMBER: *G. S.* Double Cucumbers are not uncommon, and specimens are sent from time to time by correspondents. Yours is a particularly fine example of the abnormality.

VINE DYING: *P. H. H.* We cannot state the cause of the vine dying; the portion of the rod sent affords no clue.

VIOLETS FAILING: *J. Ludg.* The Violet plants are not attacked by any fungous or insect pest. Their unsatisfactory condition is due to unsuitable conditions.

WEEDS IN POND: *H. C.* Ascertain the amount of water contained in the pond you desire to clean, by multiplying together the average length, breadth, and depth in feet, and multiplying the result by 62½, the approximate number of gallons in a cubic foot. One pound of copper sulphate should be used to every 100,000 gallons of water. Break the material small, and enclose it in a bag of loose texture. Tie the bag behind a boat, and draw it along in the water in parallel paths about 10 to 20 feet apart. The copper sulphate will not injure either the fish or the Water-Lilies, if care be taken not to let the bag remain stationary in one part of the pond.

MARKETS.

COVEYNT GARDEN, July 18.

We cannot accept any responsibility for the subsequent reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quota figures. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—E.S.

Table with 2 columns: Plants in Pots, &c.: Average Wholesale Prices. and s.d. s.d. Lists items like Aralia Sieboldii, Asparagus plumosus nanus, etc.

Table with 2 columns: Cut Flowers, &c.: Average Wholesale Prices. and s.d. s.d. Lists items like Achillea per doz., Aist-america, etc.

Table with 2 columns: Cut Flowers, &c.: Average Wholesale Prices. and s.d. s.d. Lists items like Ailanthum (Maidenhair Fern), Asparagus plumosus, etc.

Table with 2 columns: Cut Flowers, &c.: Average Wholesale Prices. and s.d. s.d. Lists items like Ailanthum (Maidenhair Fern), Asparagus plumosus, etc.

arriving in good condition, and is lower in price. A few bunches of Lily of the Valley are arriving daily. All Linnams are scarce and their prices are again higher. White, orange, and yellow Sweet Sultan and white, mauve, and yellow Sultan are arriving in excellent condition. Valley Marguerites are also good, and are selling freely. A few spikes of Gladst. America, Hilley, and Pink Beauty are being offered this week. Carnations and indoor Roses are more plentiful, but the latter are only of medium quality. The outdoor Roses have been checked by the recent rains. Foliage is not more plentiful, and sunlay, which has been absent from the market for a few weeks, is arriving in good condition. There is a plentiful supply of Asparagus plumosus. A Sprenger, Fern Maidenhair, and other hardy foliage. The first arrivals of Lavender reached the market this week. The supply is increasing daily, and the quality is good.

Table with 2 columns: Vegetables: Average Wholesale Prices. and s.d. s.d. Lists items like Artichokes, Beans, Broad, Carrots, etc.

Table with 2 columns: Fruit: Average Wholesale Prices. and s.d. s.d. Lists items like Almonds, Apples, Apricots, etc.

REMARKS.—There are only a few Venturian Apples on sale, but some growers are sending a few fruits, principally a variety called 'varieties. The market is well supplied with Apples, Peaches, and Nectarines, but Melons and Pigeons are not so plentiful as usual at this season. Strawberries are plentiful, but the best quality of these fruits having been spoiled by the rain. Black, Red, and White Currants, Raspberries, and Elderberries are all fairly numerous, and there are up to the berries of the varieties White Lion and Superb. The market is well supplied with Potatoes and Onions. A few outdoor Mushrooms are on offer, and there is a fair supply of cultivated Mushrooms. All ordinary kind of vegetables are plentiful. Cuscutas are on sale at F. H. R. Covent Garden Market, July 18, 1917.

DEBATING SOCIETIES.

TUNBRIDGE WELLS GARDENERS'. The friendly meeting of this society was held at the Friends' Society Hall during the first week in July, and the exhibitors were meritorious. The best prize among some as follows: Don Vases of Rosal N. Turner. Don Vases of Sweet Peas, S. G. Hawkes.

ROYAL GARDENERS' ORPHAN FUND

B. WYNNE, Sec., to, Bedford Chambers, Covent Garden, London, W.C.

Important to Gardeners and Fruit Growers—

"NIQUAS" (IMPROVED) (REGD)

The Most Successful Non-Poisonous Insecticide of the Day.

Its Advantages are— Certain Death to all Insect Pests. No possible injury to the most delicate Plant, Flower or Foliage. It is the 'cheapest Insecticide known, the pint makes 10 to 12 gallons for Thrip, Black and Green Fly, etc., whilst RED SPIDER, Mealy Bug and Scale can be thoroughly eradicated by using "NIQUAS" about double the strength required for Fly.

Table with 2 columns: PRICES. Lists Half-pint, 1/-; Pint, 1/6; Quart, 2/6; Half-gal., 4/-; Gallon, 7/6; Kegs, each, Five Gallons, 25/-; Ten Gallons, 45/-.

THE "NIQUAS" SYRINGE

These Syringes are especially adapted for the use of "Niquas," and as a general Vapour Syringe. The "Niquas" Syringe changes automatically from Direct to Underleaf Spraying by simply turning the Syringe.

to be had from the Trade generally. Manufacturers— CORRY & CO., LTD., STORES & WAREHOUSE, SHAD THAMES, LONDON, S.E.

THE Vegetable Garden.

This is an English translation, made by Mr. W. Robinson, of the celebrated work by the world-famous growers, MESSRS. VILMORIN, ANDRIEU & CO.,

of Paris. There are no market growers to equal the French, and in this work English readers will find placed at their disposal, in readable and interesting form, all the experience and knowledge of centuries of successful cultivation. All the principal vegetables, including many which are at present unfamiliar to English growers, are fully dealt with; and numerous clear and informative illustrations give point to the instructions contained in the text.

EVERY FOOD PRODUCER

should obtain a copy of this book, which will enable him to get the very best results out of the ground at his disposal.

PRICE 15s. NET. From THE LIBRARIAN, 41, WELLINGTON ST. STRAND, W.C. 2.

A TREASURY OF INFORMATION

is contained in the

HORTICULTURAL DIRECTORY AND YEAR BOOK.

Nowhere else can the gardener obtain, within the small compass of four hundred pages, so much information on the subjects which interest him most. The knowledge which this little work contains is just what is indispensable to the gardener in his daily life. The

CALENDAR OF GARDEN OPERATIONS

takes him through the whole year, reminding him of the manifold small cares which make all the difference between health and ill-health in his plants. It also reminds him of the exhibitions which are to be held and of the most important annual meetings.

Another interesting section, which expands each year, is the list of

SCHOOLS OF HORTICULTURE.

with a brief description attached to the name of each such institution. Those concerned with the education of young gardeners—both men and women—will turn to this section with especial interest, and those who are seeking such education will find it of the greatest assistance in deciding which school to select. There are still for sale a few copies of the current edition.

STRAWBERRIES and HOW TO GROW THEM.—Plant out in best season's planting. Complete with all cultural directions, post-free. Also up-to-date information arranged loose leaf, with special value for quantity. KING'S ACRE NURSERIES, LTD., Herts.

IT IS OF NO USE waiting until the war is over to advertise your wares. Even if you find it difficult to supply your customers, on account of shortage of staff and difficulties of transit, you should not cease to advertise. When peace is declared, there will be, at any rate for a time, increased activity in every branch of industry. When that time comes, with whom will your customers deal—with the man who has not advertised for three years, and whose war-time they have forgotten, or with the man who, by persistent and persevering advertising, has kept his name before the public? Memories are short, and people's imaginations are out of sight are also out of mind. At the very all your competitors will be struggling to obtain the business, and only he who will be in a position to offer best prospects. Are you not going to be in a position to

For Advertisement Charges see page v

THE Vegetable Garden.

This is an English translation, made by Mr. W. Robinson, of the celebrated work by the world-famous growers,

MESSRS. VILMORIN, ANDRIEUX & CO.,

of Paris. There are no market growers to equal the French, and in this work English readers will find placed at their disposal, in readable and interesting form, all the experience and knowledge of centuries of successful cultivation. All the principal vegetables, including many which are at present unfamiliar to English growers, are fully dealt with; and numerous clear and informative illustrations give point to the instructions contained in the text.

ILLUSTRATION.

Lonicera tragophylla 30

THE LIZARD ON A MORNING IN JUNE.

IN an interesting and useful little book, entitled 'A Week at the Lizard,' the Rev. C. A. Johns, author of that well-known and popular volume, 'Flowers of the Exe,' has given us a true picture of the Lizard district as he found it in 1848. Some changes have naturally taken place since Johns rambled along its rocky coasts and precipitous shores. The advent of the motor car and omnibus rendered the district more easy of access to visitors, and brought about a considerable change in the habits and fortunes of the inhabitants. Now, however, on account of Government restrictions in the consumption of petrol, in place of the buzzing engine, boating horn, and dusty roads, comparative peace reigns. But a definite object has attracted us on this bright June morning: the collection of two rare and interesting Trefloids which hide their tiny heads in a small arca near, and the beautiful Meseulanthemum, known locally as "Sally, my handson!" (the natives' nearest effort to pronounce the Latin name), which has succeeded in establishing itself in considerable profusion on the Cornish coast. For this dual purpose it will be sufficient to examine and describe (alas! the camera is excluded) a most beautiful valley a little to the west of the actual Lizard point, known as the Cornishian Valley. This is a natural rocky hill, deserving the careful attention of the land-cape gardener, for it contains examples of maritime rock-plant associations of remarkable beauty and charm. Johns says of this spot: "A sloping bank on the right hand side of the Cornishian Valley, about a hundred yards from the coast, produces, I should think, more botanical rarities than any other spot of equal dimensions in Great Britain. Here are crowded together, in so small a space that I actually covered with my hat growing specimens of, all together, Lotus hispidus, Trifolium Bocconi, T. Molinieri, and I. strictum." This little device of covering a floral area with the brim of his hat and investigating the contents thereof seems to have been a characteristic of the worthy and reverend gentleman; and it was, indeed, rather a noteworthy feat, for the hat, as we see from the picture of him climbing a precipitous cliff, was a tall one.

The chinks of the walls by the side of the road leading down from the Lizard village teem with multitudes of Cotyledon Umbellifer and neat vertical carpets of the beautiful pink-flowered

Sedum anglicum, an agreeable colour change from the common yellow species of the North Downs. Here and there are dotted small examples of Asplenium Adnigrum-nigrum. Towards the mill of water one meets charming associations of the scarlet Pimpernel, Bird's-foot-Trefoil, with yellow and bronze flowers on the same stalks, and everywhere there is a meadow carpet of pink-flowered Thrift. A little further up the valley there are occasional tufts of this plant with flowers of a much deeper colour. By the water-side revel cool green tufts of the Sea-Beet (Beta maritima) and dwarf forms of Silene inflata. On the rocks bordering the little rill of water, that charming little plant, Glaux maritima, with its pink petaloid calyx exactly simulating a corolla, forms a dense mass amongst the stones. On the lower slopes near by one finds the two Trefloids, Trifolium Bocconi and T. Molinieri, and curiously-dwarfed Jasione montana only a couple of inches high, whilst here and there occur simple examples of the Oxeye Daisy in miniature, exactly as signified by Johns seventy years ago. Flesh-coloured forms of the Pimpernel and almost pink Polygala vulgaris are characteristic of the valley. By the sides of the stream Sedum anglicum is always much paler than on the walls higher up. Spiraea filipendula, perhaps most beautiful when the flowers are just opening, grows in some quantity amongst the Gorse towards the top of the valley, where Arenaria verna, var. Gerardii, finds its home on the more barren spots of the heath. From the head of the valley may be seen the "old windmill," a conspicuous and well-known landmark in the neighbourhood, which was described by a certain waterer in 'I Drive to the Lord's End' as "the tower of a ruined church, venerable with age," in error rather curiously commented on by Johns.

The Meseulanthemum, now so thoroughly naturalized and so characteristic a feature of the sea-slopes of Cornwall, occurs on an old quarry face at the right hand side of the entrance to the Cornishian Valley. This particular patch consisted of M. aspidotale, a native of Australia, Chile, and California, with magenta flowers, and another species, M. edulis, from South Africa, with the young flowers either pale purplish-yellow or pink, the yellow ones soon changing to pink. The change of colour from yellow to pink is a fascinating young flowers, quite yellow when packed and despatched by post, were pink on arrival at Kew. I collected material from a single plant of a third species, with deep magenta flowers and rather different leaves, between Portovenia and Looe Pool, about half way up the slope near the boundary of Captain Rogers' estate. Mr. Belle has determined this to be M. macranthum, and it is apparently the first record for this species.

The two Trefloids which grow in the Cornishian Valley seed at Cudworth, a little further east, are very interesting from a phyto-geographical standpoint. Together with a few other species of plants, they constitute the Lusitanian and Mediterranean elements which are so remarkable a feature of the Cornish flora. These two Trefloids occur nowhere else in Britain, and they both have a fairly wide distribution in France and the Mediterranean littoral. It is not my role to discuss the question as to whether their occurrence in Cornwall is evidence of a former land connection with the Continent, or whether they were introduced since the glacial period, when the temperate flora of these islands is supposed to have been entirely destroyed. In his book on the origin of the British flora, the late Clement Reid strongly supported the latter theory. The species under consideration certainly grew naturally enough, as if they had been there as long as any other portion of the flora of this interesting district. In reference to this subject, we cannot conclude without quoting the very wise remarks of the Rev. C. A. Johns nearly seventy years ago: "The fact that the Trefloids peculiar to

the district should have been discovered growing together has been thought so singular that some botanists have entertained doubts whether they are really indigenous. I myself see no reason to doubt that their first introduction was coeval with that of the rest of the vegetation on the cliffs. It should be remembered that, as the Lizard is the most southerly point in England, and its climate uniformly mild, we have good grounds for expecting to find plants properly belonging to the warmer sea-coasts of Europe, and such is the case of these three Trefloids. . . . The cliffs in the vicinity of the Lizard are precipitous, and no ballast thrown overboard or washed from a wreck could be carried thither. The serpentine formation is a very uncommon one in England, and may be favourable to the growth of the plants in question; if this were not the case, we should, perhaps, find them in other situations. But, after all, the simplest solution of the question is to assume at once that there was a time when Great Britain was a portion of the European Continent. The whole was then clothed by continuous zones of vegetation, which the subsequent formation of the Channel interrupted, indeed, but did not destroy." J. Hutchinson.

NOTICES OF BOOKS.

THE FIGS OF MEXICO AND CENTRAL AMERICA.

WHEN, in 1883, I compiled the enumeration of the Figs for the Botany of the Biologia Centrali-Americana, between forty and fifty reputed species were on record for that region; but as the Kew Herbarium contained authenticated specimens of fewer than half of these reputed species, no attempt at a critical revision was undertaken. Since that date many districts of the countries in question have been much more thoroughly explored botanically, and a relatively large number of additional species discovered. Mr. Standley defines forty-one species of Ficus, more than half of which are new to science; so that more than half of the names in the Biologia are reduced to synonymy of others. From the numerous discoveries of the last half century, especially in Asia and Africa, it may be estimated that Ficus numbers at least 800 species, generally dispersed in tropical countries, but most numerous in Asia and Africa. A. Garcia is at home in the Mediterranean region; a few species extend beyond the tropics in Eastern Asia and Eastern Australia. None is recorded north of Mexico, or far outside of the southern tropics of America. Figs are common in Western Polynesia, and characteristic in some islands, and Ficus columnaris is one of the most remarkable and conspicuous trees in Lord Howe Islands, a speck in the ocean 500 miles east of Australia. It is similar in habit and dimensions to the Banyan, F. indica. Noteworthy among the Mexican and Central American species are F. interamarginalis, F. cotinifolia, F. pallifolia, and F. glabrata. The first has broad leaves 10 to 15 inches long. F. cotinifolia is very common, and ranges from the Northern States of Mexico to Costa Rica. F. pallifolia is equally common, from North Mexico to Panama, and is credited with twenty-one synonyms. F. glabrata is a tree often 80 to 120 feet high, common in Guatemala, and extending to Colombia. Mr. Standley employs the characters afforded by the inflorescence and flowers as primaries in his classification and definitions of the species and those of the leaves as secondaries. He makes no reference to the phenomena of fertilisation, and, what is more to be regretted, he gives no differential description of the genus Ficus. W. Botting Hemslery.

* "The Mexican and Central American Species of Ficus," by Paul C. Standley, Contributions from the United States National Herbarium, XX, Part I, pp. 1-35, with an index, 1917.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher. Our correspondents would oblige by obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be sent, should be directed to the Editors. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors will not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editor any intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 62.2.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, July 26, 10 a.m.; Bar, 28.9; temp. 62.2; Weather—Dull.

The Fruit Crops.

Once again we publish the reports on the condition of the hardy fruit crops. The present occasion is not an ordinary one; on the contrary, it occurs during a period when the mind of the country is in large measure focussed on the task of maintaining the food supply in the face of diminished imports, and this is only possible by increasing the yields from our own lands and our own labour. If such circumstances the value of the fruit crops, taken collectively, must not be underestimated on the ground that their food contents do not compare favourably with certain vegetables, cereals, and meats. Whilst we have very wisely got into the habit recently of considering more carefully the caloric contents of foods, we know, at the same time, that there are qualities that make fruits almost as necessary for man as those foods generally regarded as indispensable for their protein, fats, or carbohydrates.

The figures before us are certainly most encouraging, for they promise above average crops for most kinds of fruit still un-gathered, and we hope they may be taken as an earnest or token that later on there will be heavy Potato yields and a bountiful cereal harvest. In England, out of 179 reports upon the Apple crop, there are 150 equal to or above the average, whilst only 29 returns record yields under average. In Scotland there are only 12 deficient crops out of 41 reported upon; in Wales the nine returns are all average or over the average; and in Ireland there are 22 crops that are satisfactory out of the 25 returns. In the light of these figures we may conclude that the Apple crop will be liberal and good, and, following, as it does, the unusually scanty yield of last season, it will be doubly welcome. Apples can be kept good longer than most fruits, and this fact greatly increases their value.

Pears, though not of equal economic value with Apples, are nevertheless more palatable to many, and the abundant crops of this fruit will be a joy to the fruit grower and consumer alike. The returns are almost as favourable as those already cited for Apples. The English returns record only 30 under crops out of a total of 179; Scotland has not so good a promise, there being 29 deficient crops in the total of 43 returns. Wales furnishes nine reports, but no under-average crop, whilst Ireland has three such crops included in its 25 returns. Plums appear to be not more than an average crop. In England the 179 returns include 73 average, 46 over average, and 60 under average. In Scotland the prospects are less propitious, there being 29 under-average crops included in the 42 returns. In Wales and Ireland Plums are more plentiful than usual.

Cherries are a very plentiful crop, especially in the districts where they are grown for the supply of the markets, but as these are now being gathered we need not go into details. For the same reason it will be sufficient to state that the Strawberry crop was not quite equal to the average, whilst "small fruits," including Gooseberries, Currants, Raspberries, and other berries, appear to be giving wonderful yields everywhere. The best return of all is concerned with Peaches and Nectarines. We scarcely remember such favourable reports upon these choice and, from the point of view of outdoor cultivation, somewhat delicate fruits. The 110 returns from England include 59 average, 73 "over," and only eight "under" average reports. In Scotland, Wales, and Ireland the crops are not less satisfactory. Apricots are not so plentiful as Peaches, and these richly flavoured fruits, all too scarce in the best of seasons, will be rather less plentiful than usual. With regard to Nuts, our tables do not specify the different sorts separately, but collectively the report shows them to be much above the average. In the summaries on page 37 are set out the figures for last year as well as this, and readers will thus be able easily to compare them.

There can be little doubt but that the liberal fruit promise is largely the result of the unusually late spring and the consequent lateness of the flowering period. In most cases it was at least a month later than usual (see *Gard Chron.*, Vol. LXI, p. 149), and by that time most of the danger from late frosts was past. In regard to Apples, however, the comparative failure last season may have predisposed the trees to fruitfulness this year. There have been many complaints of caterpillars this season, including those of the codlin moth, winter moth, lachey moth, and others—which, like the poor, are always with us—but these are epidemic in different localities every year. We remember seeing such devastation in Hampshire two years ago that cannot possibly be exceeded this season in Kent or anywhere else.

In looking over the summaries of the report it becomes clear that there have been or will be good crops of such soft fruits as

Plums, Strawberries, Cherries, Currants, Gooseberries and Raspberries, fruits that are used in great quantities for the making of tarts and jams. How far the deficient supply of sugar will affect the value of such fruits it is not possible to say, but it will affect it considerably. Waste is to be feared in country districts where there are good Plum crops, but no preserving sugar. Cottagers, and even many farmers, have not the habit of bottling without sugar, and much of the fruit is likely to be left on the trees. It is a great pity that steps were not taken to ensure a better distribution of such sugar as is available. Fruit cultivators were asked to apply for sugar for use with their own fruits, and in numerous instances the applications were not even acknowledged. However, we would urge on our readers the great importance of using all their influence to encourage those who have fruits to preserve them in the largest possible quantities.

From announcements in the local Press it would appear that the bulb-growing industry in the

Bulb Rearing in Lincolnshire. Holland division of Lincolnshire is threatened with a serious menace. The announcements made by the Agricultural Committee require a large restriction of the area under bulbs, and prohibit the planting of new bulbs on fresh ground. From inquiries which we have made, we understand that bulb-growers in this district have already, and of their own initiative, made considerable contributions to food production. A large proportion of the ground which they cultivate is already being devoted to the growth of food, and there is also "over-planting"—that is, sowing suitable crop crops in the ground occupied by certain of their bulbs.

The fact that they have done this, and are, as we understand, prepared to go further in these directions, absolves the bulb-growers of the Holland division from any charge of failing in their duty of food production. But to order them to refrain from planting bulbs in new ground is, we fear, to damage very seriously their industry. To require that luxury branches of horticulture should be reduced to the smallest limits is in present circumstances legitimate, and, indeed, necessary; but to destroy one of a number of industries concerned with unessential crops requires far greater justification than the present circumstances serious though they be offer. That that part of the order issued by the local authority prohibiting planting in new ground will have serious effects on the industry is, we fear, not to be disputed. Ground under bulbs is very generally infected with eelworm, which pest is responsible for widespread destruction. To insist on infected ground being used for planting is to encourage the disease and to prejudice the crop.

We feel sure that those responsible for issuing this order will recognise that the injustice which it does cannot be balanced by the small increased acreage brought under the cultivation of food-crops, for it is

FIG. 15 — LONCHOCERA TRAGOPHYLLA: FLOWERS YELLOW.
(See p. 40.)

to be observed that the order is only of local application, and it makes it an offence to do in Spalding what anyone at Wisbech or other bulb-growing centres may do with perfect legal propriety.

Measures to increase food production have had, and will continue to have, our active support, but such a prohibition as that relating to the planting of bulbs on new ground cannot have the support of anyone with knowledge of the horticultural industry. It enforces a grievance, imperils an industry, and ignores the fact that the bulb-growers have shown, and are showing, themselves to be patriotic in devoting a large part of the acres which they hold to the production of food-crops.

FLOWERS IN SEASON. Early in the present month Mr. THOMAS COY, of Duffryn, Cardiff, sent us specimens of several interesting plants that have done remarkably well at Duffryn during the present season. Amongst them is *Lonicera tragophylla*, which is illustrated in fig. 15. Mr. Coy says that he has grown this plant for some four or five years, but never was the bloom so fine as this season. The specimens were cut from a plant growing in the nursery, where it has been since its introduction to the gardens. Another plant is growing on an east wall, and it was the mass of bloom at the time of writing, but the panicles were not nearly so large as those produced in the more open situation. The yellow flowers of this species of Honeysuckle, 2½ or more inches long, are exceedingly attractive. Another pleasant feature of the plant is the beautiful bronze shade of the young foliage. *Lonicera tragophylla* obtained an Award of Merit from the Royal Horticultural Society on the occasion of the Chelsea Exhibition in 1915. Regarding *Syringa japonica*, Mr. Coy states that he has grown the species for 20 years, and it has hitherto proved a poor doer, but this year it was one of the most ornamental and strong-growing shrubs in the garden, the panicles of white flowers being all that could be wished. Another plant that Mr. Coy draws our attention to is *Rosa Irbay*, which he thinks is one of the less-known ramblers. At Duffryn, where *Roses* do remarkably well, and there is a very fine collection of ramblers, the variety *Irbay* is considered one of the most ornamental, the rich colouring marking it out strongly amongst scores of other *Roses* with which it is growing.

MR. HENRY B. MAY, member of the Council of the Royal Horticultural Society, and chairman of the Floral Committee, who recently underwent an operation for an affection of the throat, has so far recovered that he was able to return home on Thursday last. His many friends will be delighted to hear that the operation is believed to have been entirely successful, and the recovery from its immediate effects unusually satisfactory.

RECORD RAINFALL. *Synon's Meteorology and Magnetism* states that 9.84 inches of rain were registered at Sexey's School, Binton, Somersetshire, on June 28 last, the amount constituting a record for the British Isles. The greatest fall on a rainfall day previously known was 8.20 inches, at Kyleshoepinch, Inverness shire, on October 11, 1916. Mr. W. A. KNIGHT, the headmaster of Sexey's School, stated that the rain-gauge measured 9.84 in. by between 10 a.m., June 28, and 10 a.m., June 29 (summer time). Other local records are: 1. ½ mile S.W. (9 a.m. to 9 a.m.), 7.90 inches; 2. ½ mile N.E. (9 a.m. to 9 a.m.), 8.11 inches; 3. 3 miles N. (9 a.m. to 9 a.m.), 8.03 inches. The damage done in the parish to roads, walls, hedgebanks, house property, furniture, and gardens is estimated at from £1,000 to £2,000. In some places 2 feet of debris was

deposited, and in others excavations of 2 feet to 5 feet deep were washed out down to the rock. The playground of the elementary school adjoining the River Brue and surrounded on three sides by masonry, although 10 feet above the normal river-level, was scooped out to a depth of 2 or 3 feet. Some cottages were flooded to a depth of more than 6 feet.

GARDENERS AND THE RESTRICTED OCCUPATIONS ORDER.—It has been decided that the provisions of the Restricted Occupations Order shall not apply to the engagement of gardeners, provided that their principal and usual occupation is the growing of foodstuffs or instruction in the growing of foodstuffs. The provisions of the Order, however, continue to apply to the engagement of gardeners for work which does not fulfil this condition. It has also been decided that the provisions of the Order shall not apply to the engagement of any sailor or soldier who has been discharged from the Naval or Military Services of the Crown in consequence of disablement or ill-health. The provisions of the Order apply to the engagement of rejected men between the ages of 18 and 61 for work in any of the trades or occupations mentioned in the Schedule to the Order. A man who has enrolled as a National Service Volunteer may be engaged to work in any of the trades or occupations mentioned in the Schedule to the Restricted Occupations Order until such time as he may be called upon to undertake work as a National Service Volunteer, or if he or his employer appeals, until such time as the appeal has been considered and refused. Notice of the proposal to transfer a National Service Volunteer to other work will be sent to the volunteer and to his employer, and it will then be open to either or both to appeal against the proposed transfer.

WAR ITEM.—The Right Hon. Lord ARTHUR HULL, 101, New Bond Street, London, appeals for Lavender to be sold in aid of the Auxiliary Maintenance Fund for the Y.M.C.A. Huts and Miss LENA ASHWELL'S Concerts at the Front.

PLANT HYBRIDISING.

ANYONE who studies a modern catalogue of hardy plants, or who walks through a good garden, must be struck with two facts, the vast quantity of first-class material apparently waiting for hybridisation, and the small number of existing hybrids. It is very puzzling. We have been a race of gardeners for hundreds of years. An endless succession of leisured garden lovers has stared at the same two facts, and yet they remain in seeming contradiction. Important genera the *Salvias* will do for an illustration—show no hybrid. Others show one or two crosses out of a very large number of potentials. What is the explanation? Why cannot we get the dark Gentian type of *Salvia patens* on to a hardy species, or the equally fine light blue of *S. Pichei* on to something which blooms before October? Is it that the crosses have never been tried, or is it that they cannot be done?

About twelve months ago I decided to attempt this problem, and crossed a number of plants which were then available. This spring the experiments have been continued on a larger scale, and with the utmost care. The results have been very interesting. Three facts stand out prominently. The first is variability of the seed parent. Some plants, so far as the production of plump seeds is a test, cross easily. Some refuse to cross, no matter how often they are wooed, and some will only cross as a rare grace. We tried one cross 32 times, and of these 31 were failures. But the 32nd was a gratifying success. The second fact is that apparently good

seed has been got from some highly interesting crosses in which both the parents have been first-class plants. And the third fact is that the forecast seed declines to germinate.

It is this fact which has set me writing, in the hope that readers may be able to give me some help. Have we here the solution of the mystery? Is the scarcity of hybrids in hardy plants due, not to the inability of the plants to produce seeds, but to the fact that the seeds lack viability?

There is another chance. The seeds may be viable, but they may require something different from ordinary treatment to bring out their life. I have been accustomed to deal with the difficulties of seeds sent from China, which have to stand the sweating of the Red Sea. Thorough drying beforehand is their prime need, and in the case of seeds sent from the Himalayas I have latterly tried, with good results, the plan of packing particularly good seeds in bottles filled with CO₂ and hermetically sealed. Mr. Cooper has been very successful at this operation, and seeds so packed have germinated which have failed under ordinary packing. I have also tried the plan of putting the seeds in cold store for three months, without much success. But at Edinburgh, where Dr. Balfour, with his accustomed enterprise, has built a special seed refrigerating house, I know that good results have been secured, especially with *Meconopsis*. This, too, is the plan on which M. Correvon relies for the germination of his Alpine seeds. But he has the natural covering of the snow, and that may be to seeds much more desirable than the artificial condition of a cold store.

So the upshot of it is that I write to ask readers of the *Gardeners' Chronicle* if they have had any experience in the germination of crossed seeds, and, if so, whether their experience has been the same as mine; and further, on the general question of seed raising, whether you or they can give me the names of any books, British or foreign, dealing with the subject, and the experiments which have been made? *A. K. Balfour.*

FOREIGN CORRESPONDENCE.

SEED-GROWING IN MACEDONIA.

NOTICING in the *Chronicle* of a few weeks ago that there is a probability of a great seed scarcity next season, it has struck me as very singular that not one of our seed firms has taken advantage of the glorious climate of Macedonia (The summer, starting in February and continuing well into November, certainly offers every facility for the thorough ripening of seed. In a French hospital garden near this place I have to-day (May 20) seen Stocks, *Potunias*, *Mari-golds*, *Pansies*, *Mignonette*, *Antirrhinums*, *Dianthus*, *Nasturtiums*, and other flowers, with seed almost ripe; also *Spinach*, *Radishes*, *Lettuces* and *Beet*.)

I am stationed at the 41st General Hospital, Salonica Forces, and have a fair-sized garden to keep me in training for the much looked-for return home.

I have finished the Peas sown on January 15. Have dug Potatoes planted on December 31, and am now cropping Cabbage and Turnips sown respectively on January 15 and March 22. Beet and Carrots grow with amazing speed, as do Lettuces, Radishes, and Endives. I have to thank Messrs. Chibran for a nice assortment of seeds, and it is pleasing to note the contrast between the strains from home and the exceptionally coarse Greek varieties.

Tomatoes planted in the open on April 10 are now in bloom, whilst Marrows and Melons sown out of doors on the same date are making headway. Private R. G. Armstrong, formerly with S. Gatrix, Esq., Whalley Range, Manchester, May 20, 1917.

The Week's Work.

THE KITCHEN GARDEN.

By J. DENN, Foreman, Royal Gardens, Windsor.

SPRING CABBAGE.—Make preparations for next season's supply of Early Cabbages. Select an open position where the ground is not too rich, and sow in shallow drills drawn at 1 foot apart, so that the hoe may be freely used between them. As soon as the young plants are sufficiently advanced transplant them to a plot of rich soil, where they will be left to mature. Harbiner and Early Offenham are good varieties for sowing now, and they seldom run to seed.

ASPARAGUS BEDS should be kept free from weeds, and a dressing of artificial manure applied during showery weather. Pea sticks which have been used for the early crops, and are now available, can be placed in position to support the plants and prevent them being injured by the wind during the autumn. Young beds of seedling Asparagus should not be allowed to become overworked.

WINTER ONIONS. Sow seeds of Onions to produce bulbs in spring and early summer, in shallow drills 16 inches apart, and keep them free from weeds throughout the autumn. White Lisbon may be sown for early use, but the variety is not good for any other purpose. Alsas Cruz, The Lord Keeper, and Lemon Rocca are good varieties.

EARLY POTATOS.—Lift the first plantations of Potatoes as soon as they are ready, in order to use the ground for a winter crop such as Spanish, Turnips, or salad. The tubers should be allowed to remain on the soil for a short time before they are placed in the store room, so that the skins may become hardened. Do not place a large quantity of tubers together, or they may become heated.

LATE PEAS.—As soon as the latest sown Peas are sufficiently advanced strong sticks for their support should be placed in position and made secure. The weather is favourable at present, but if a dry period sets in give frequent applications of soft water, and mulch the ground with farmyard manure.

TOMATO PLANTS in the open should be kept free from side growths and rough, decaying foliage. Keep the plants in an upright position either by tying or nailing, as it becomes necessary, and give the roots a topdressing of artificial manure.

VEGETABLE MARROWS. Keep these plants from becoming overworked by the removal of small, worthless growths. This should be done gradually, so that it may not become necessary to remove large quantities of growth at one time. Give a liberal supply of manure water at the roots, and cut the Marrows as soon as they are of sufficient size to use.

TURNIPS. A sowing of Turnip seed should be made at once to produce roots for use during the winter, and another sowing a week later, to remain in the ground during the cold weather. From this sowing useful heads may be available throughout the spring. Thin out young plants as soon as they are of sufficient size, and allow plenty of space between them. Dust them freely with sifted wood ashes, and hoe the surface frequently to promote healthy growth.

FRUITS UNDER GLASS.

By JAS. HEDDER, Head Gardener at Gannessbury House, Ayles, W.

LATE PLUMS IN POTS.—Plums of good quality that will ripen in cold houses during September and early October are exceedingly useful; it is only in favoured and protected localities that Plums attain to their best quality out-of-doors. Kirke's, one of the best of Plums, will often crack after a day or two of showery weather just as it is ripening. Transparent, Early Golden Transparent and Late Transparent Gages are all at their best, when grown

in pots. Our late Plums are now somewhat crowded, as we have not yet picked all the fruits from trees that were slightly forced. By the end of the month these early trees will be shifted outside, and the late ones taken indoors. After that, the trees that have fruited will be plunged in ashes over the rims of the pots, the earliest being so treated in a cold house, where the late Plums are now standing. The remainder will be left outside until October. Our crops of late Plums are excellent.

APPLES AND PEARS IN POTS.—In the early spring I advised growers not to keep Apple and Pear trees in pots under glass any longer. If, however, any growers have their stock still under glass, the trees should now be placed outside in order to finish the fruits. Care should be taken to safeguard the trees from birds, either by netting or by a wire curtain placed over them. Plunging should also be resorted to so as to secure the trees from winds and to conserve moisture at the roots. A few doses of artificial manure containing a 1/2 per centage of phosphates and potash will assist trees with heavy crops, and sown sprinkled over the ground will aid in imparting colour to the foliage.

MELONS IN PITS AND FRAMES.—Give every possible encouragement to Melons, which are now swelling their fruits. Do not allow the plants to suffer from drought at the roots, but do not make too free a use of liquid manure from the farmyard. Keep Melons in frames, on which the fruits are ripening, somewhat drier, but still maintain a fairly high temperature. Keep all superabundant growth well in check by pinching with the finger and thumb rather than by means of the knife. Cantaloupe Melons especially are gross growers, so a few more fruits can be left on the plants than on those of other varieties.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. Arthur J. Bouver, Abbots Wood, Godalming, Surrey.

HARDY VINES.—Trim as sufficient of the long shoots of hardy Vines to preserve an even balance of growth, also any stems that are necessary to furnish late crops. Pinch the laterals to allow the air and sunshine to reach the bunches, only one of which should be permitted on a single shoot. In very dry situations the pots may need misting even after rains, and when water is graded it should be given copiously. Watch carefully for signs of mealy, and directly any is detected dust the foliage with flowers of sulphur.

Figs. Remove the ends of the straggling shoots on Fig trees and take away all needless growth to expose the fruits as much as possible to the sun's rays. If the young shoots are thinned sufficiently, new very little further pruning will be needed this season. Old wood-out shoots bare of leaves at the base may be removed entirely. Afterwards secure the shoots to the wall by nailing or tying. Fig trees are usually planted in very limited borders, and the roots quickly exhaust the small amount of soil medium; for this reason it may be necessary to give the roots a thorough soaking when the fruits are swelling. If a little concentrated feed-Bor is first applied to the border the water will wash the manure down to the roots, or, if preferred, liquid manure from the farmyard may be used instead.

RASPBERRIES.—As soon as the crop is gathered remove the nets that have been used to protect the fruit from birds, and cut out the old canes. Afterwards clear the ground of weeds and secure by ties any of the stakes that need support. Let the plants have liberal treatment to make strong growth before the winter.

AUTUMN-FRUITING Raspberries. One of the most popular varieties of autumn-fruiting Raspberries is Belle de Fontaine, a variety that will furnish a good crop of fruits at the end of September and in October. Reduce the number of canes, leaving only the best and strongest. The plants will need watering in dry weather, and the ground should be mulched.

PLANTS UNDER GLASS.

By J. G. WILSON, Gardener to Lady Nourse, Earlswell Park, Kent.

SOUVENIR DE LA MALMAISON CARNATIONS.—Preparations for layering Souvenir de la Malmaison Carnations should be pushed forward without delay, as the latest varieties are now passing out of flower. The earlier the layers are potted the better chance have the young plants to become well established in the pots before winter. Strong, healthy plants should be chosen for layering. They should be layered in a frame, so that they can be protected from heavy rains, but a close atmosphere must be avoided. The best plan is to layer in shallow frames, keeping the lights on, and shading lightly during the hottest part of the day. Give sufficient air to ensure a perfect circulation, and extra air should be admitted in the evenings. A compost consisting of two parts chopped turfy loam, one of leaf soil, and one of burnt earth, and a fair quantity of sand will be suitable. See that the plants have been thoroughly watered before being layered. After completing the layering, water lightly in, and continue to damp the plants each evening. They will root quickly under this treatment. When the young layers begin to grow, the lights should be entirely removed. When well rooted, sever the layers from the parent plant, and leave them for a few days, first giving a good watering. They will then be ready to lift at any time. This treatment will build up strong, healthy plants, which should pass through the winter without contracting disease.

GERANIUMS. When required for autumn and winter flowering, some of the comers of them are usually kept dormant in a cooler house. These must now be shaken out and potted. Put them in light, porous soil, and place the pots in a warm house or stove to start. 4 or 5 inch pots are large enough for ordinary purposes, but if large specimens are required, these can be made up later by placing several plants of uniform size into a large pot, when they have started into growth. A very moderate amount of water will suffice for some time. The dampness brought about by a light spraying round them will usually be enough to induce growth.

THE FLOWER GARDEN.

By W. J. GIBBS, Gardener to Mrs. Demerut, Keele Hall, Staffordshire.

THE ROSE GARDEN.—In the Rose garden the watering should be in constant use, but care must be taken to avoid wetting with the inside of the Roses that are just opening, as the flowers will be ruined. Examine the trees very carefully for caterpillars and mealy. Aphids and most other insects can be kept in check if the trees are syringed with Quassia Extract at intervals of a week or ten days. Continue to feed the plants with diluted liquid manure, and occasional doses of soot water. Should an artificial manure be used, give about two teaspoonfuls in a gallon of water; "a little and often" is the best method. Tie in the strongest shoots at the base of climbers before they become twisted or broken by wind. All dead flowers and suckers should be removed and the beds made neat and clean.

DAHLIAS.—During dry weather Dahlias require copious supplies of water, and a liberal mulch placed round the base of the plants, directly after a thorough soaking of clear water. Straw or glass should be placed in position at once, and all weak growths cut out, the young shoots being tied in with strong, soft material. Keep the surface soil stirred with the flat hoe.

SWEET PEAS. Give Sweet Peas liberal supplies of water during dry weather, and apply light dustings of concentrated fertiliser at intervals previous to watering.

DAFFODILS.—If the bulbs have not been lifted already, they should be taken out of the ground at the earliest opportunity. The largest bulbs may be reserved for forcing. Let them be carefully dried, suspending them thinly in boxes, and placing the boxes in a cool shed. The small bulbs may be replanted in ground that has been well cultivated, or they may be utilised for naturalising in grass.

ON INCREASED FOOD PRODUCTION.

OLD SEED AND NEW.

MR. TURNER (p. 24) complains of the growth of garden seeds this spring, and lays the bad result to old seed being mixed with new. This complaint is often made, but from my experience unsatisfactory results are seldom due to this cause, but to others, as it is to the seedsmen's interest to supply good seed. It is unreasonable to suppose that all seed left over from a previous year is thrown away; after a bad seed harvest, and when certain seeds are scarce, the yearling seed stocks are absolutely necessary to meet the demand. I am of opinion that faulty growth this spring is owing to the period of dry, cold weather after seed-sowing time. My Cos Lettuce failed in the first sowing, and after I had, like others, condemned the seed, upon sowing a second time from the same packet the result was entirely satisfactory. One end of a row of Kale I sowed came up, and the other failed, whilst I had a similar result with Cabbage. With these three exceptions, the whole of my garden seeds germinated at the first sowing. Given the necessary conditions of temperature, moisture, and freedom from slugs and other pests, seeds very rarely fail to germinate satisfactorily. *M.C., Worthing*

BEANS.

If the Runner Beans are intended for use in soups it is much better to grow white varieties—there is then no need to add the labour of skinning them. At must be ten years now since I allowed a Scarlet Runner Bean in my garden. Treated as flageolets, very fine creamy Beans appear from several of the sorts. Broad Beans form a useful addition to the herbaceous border, where their glaucous foliage, and especially the black of the blossoms, is an unusual colour. I am trying drying some at a very young stage to add to the variety of winter pulses; it is said that they are quite good thus treated for storage.

BOTTLED FRUITS.

SMALL fruits bottled in water only are apt to be rather poor unless they are washed into a juice. The reason is that various constituents diffuse or osmose out from the interior of the fruit. To avoid this I am having the bottles filled off with the juice of the fruit. Raspberries or Currants may be treated with each other's juice. The readiest way of extracting the juice is with a press like the American "Entrepris" press, which has a continuous action, and which we have used for over ten years for making all jams with seedy fruit, such as Blackberries and Currants.

SOME "NOVELTIES"

MR. MOLYNEUX (p. 15) applies the word "novelty" to the Mangoutou Pea and to Good King Henry. Thompson, in 1859, mentioned three varieties of "Sugar" Peas; if the variety "French Sugar Pea" is the same as that I have bought under the name it is a pity to have selected it for a start, as in delicacy it is by no means as good as, for instance, Vilmorin's Grande Grosse, or even the little Breton. These Peas make excellent Green Pea soup. With regard to King Henry or Mercury, the leaves should not be picked and cooked "à l'instar des épinards" to have it at its best. In the spring, when little else green is to be had, the young flowering shoots still in bud are cut off close to the stool. After washing and tying in bundles with leaves and stalks, they are cast into a large quantity of boiling salted water and cooked till tender (about half an hour, or more as the season progresses). Very thorough draining and pressing are necessary, care being taken to keep the stalks straight. Serve with run butter. (Recipe from Lincolnshire.) Eaten alone there is a

distinct Asparagus-like taste about it, but, of course, most English people will miss this by eating it together with meat, and not as a separate course. With regard to cultivation, beyond hoeing for weeds my patch has had no attention or manure (except a little artificial) in the past six years, and it is still a success. The main points are to keep cutting the flower-shoots whilst young, and cut them low, or small secondaries sprout, and in July, when seeding may cause trouble. Clean up the plants by removing all blossom; the cuttings must be burnt soon, for, like Spinach Beet, the seeds will ripen off though buried in earth. Even with some care in this, self-sown seedlings are apt to appear; they have been useful this year, as people are beginning to attend to useful vegetables, and wanted seedlings. Half-a-dozen plants should be in every small garden—any out-of-the-way, shaded corner will do; twelve plants are quite enough for a small household, at any rate when they are three or four years old. As one of our few indigenous vegetables, which indeed may have been used as an entree, not when a costume of wood was "de rigueur," it hardly merits the term "novelty." *H. E. Durham.*

TRAINING THE TOMATO.

I CAN endorse the remarks of Dr H. E. Durham (see p. 260) on the advantage of training the Tomato on the double stem system. It is twenty years ago since, as a journeyman, I was first taught the method your correspondent described in a Herefordshire garden. The plants were grown in a long, span-roofed house, the long lights of which permitted good lengths of growth to be accommodated. The plants were pinched as described, and produced shoots more or less uniformly like a Chrysanthemum. We never found pegging necessary to equalise growth. Obviously a fewer number of plants is required—in fact, just half when grown on the two stem method—while the work of pinching out side shoots is reduced to a minimum through the vigour of the plant being diverted to the support of the extra stem. *C. T., Amphill Park Gardens*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ROSE QUEEN ALEXANDRA. The fact of a Gold Medal being awarded to a Rose bearing the above name at the meeting of the National Rose Society on July 17 is likely to cause confusion. As matters stand now, Queen Alexandra No. 1 was given a Gold Medal in 1901. Queen Alexandra No. 2 received a Certificate of Merit last year, and now comes No. 3, another Gold Medal winner. Surely the judges responsible for this blunder were not so ignorant of the nomenclature of Roses as to be unaware that the name had been used before? It would be a good idea if at the next meeting of the National Rose Society a resolution was brought forward refusing to recognise any variety bearing a name that had been previously adopted. *H. T.*

CHAMPAGNE BOTTLES AND CABBAGE FLY.—On some allotments which I have seen the monotony of the Cabbage plots was broken by a number of champagne bottles stuck up on long sticks. On inquiry, I learned that the bottles are regarded as a means of scaring away the Cabbage moth, and that the allotment-holders learned the trick from Italian gardeners. Can any of your readers tell me whether the practice secures the desired result? At first sight it looks an unlikely sort of butterfly scarecrow, but I am assured by those who have tried it that it is effective. *N.*

POTATO SPRAYING.—Mr. Pickering asks for the authority to use the phrase "Burgundy mixture." If I may judge from my small library of recent French works, in all of which, where mentioned, the lime-copper washes are called "Bouillies bordelaises," and the soda-copper ones "Bouillies Bourguignonnes," I imagine that in

using the phrase "Burgundy mixture" we are simply following ordinary French practice. See for example, Verrier, *Arboriculture fruitière*, 1912 (where reference is given to Chancier, *Viticulture*, Encycl. des Connaissances agricoles), and Dubor, *Viticulture moderne*. It may be worth noting that Abegg's *Handbuch* gives the end-product of equivalent amounts of soda carbonate and copper sulphate as $3\text{CuCO}_3 \cdot 3\text{Cu(OH)}_2 \cdot \text{H}_2\text{O}$, while in the gel state the ratio CuO to CO_2 is also 2:1; some form of hydrated product or products is perhaps more likely than the anhydrous one that he gives. The last time I had much disease, a wet year, I was impressed by the enormous number of earwigs that sheltered amongst the diseased leaves, and could not help thinking that they must have helped to spread the spores. As a possible deterrent and antiseptic in later years I used lysol, and another cresol preparation; also acetate of copper in $\frac{1}{2}$ per cent. with pyridin. An equal volume of 2 per cent. lysol poured into 1 per cent. copper acetate makes an opalescent fluid, which does not settle out for a day or so; it is, perhaps, somewhat on the lines of "Truffant's" "Léssive Alcalino-Cuprique Crésyle" which is for winter use. I have not seen it scorch Potatoes. Surely there must be possibilities beyond the eternal Burgundy and Bordeaux washes? Calcium polysulphide ("lime-sulphur") does not seem to be well reported upon so far as I gather. *H. E. Durham.*

STANDARD RED CURRANTS.—I have a row of fan-trained Red Currants grafted as standards presumably on Ribes aurea. They flower and set wonderfully well, but drop many of the fruits of each bunch, so that only a few berries come to maturity. I suspect that deficient water supply is the cause of the trouble. Can any of your readers inform me whether it is customary to slit the bark of the stock in order to enable it to make more wood, and hence to conduct water better from the root to the scion? *Amateur.*

HOME-MADE NICOTINE WASH (see p. 11).—The remarks of *Southern Grower* will, I trust, revise the agitation in favour of home-grown Tobacco for nicotine wash. "Cannot the Food Production Department help in this matter?" The experiments at Wye and elsewhere have shown that Kentish-grown Tobacco is extremely rich in nicotine, and if this were used there would be no need of any denaturing process. Those who, like the writer, have smoked a pipe of the home-grown product would not repeat the experiment. *E. A. Barnard.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JULY 17.—President: Mr. E. A. Bowles, M.A. in the chair, Mrs. Bateson and Voelcker, Sir Everard in the Chair, Messrs. W. C. Worsdell, W. G. Baker, E. J. Allard, J. W. Odell, H. J. Elwes, and E. J. Chittenden (hon. secretary).

Fasciated Asparagus.—Col Sandeman, of Haying Island, sent a very large specimen of the common Asparagus showing fasciation, having a stem over 2 inches in breadth.

Infertility in Barley Field.—Dr. Voelcker showed specimens of Barley from fields on Salisbury Plain very stunted and poor, and another of about normal growth from places in the fields where stools had stood last season for a month. Doubtless the greater fertility of the place where the stools had stood was due to the washing out of salts, etc., from the old Barley, and possibly also to the protecting from washing of the soil beneath them, but the infertility of the remainder of the field, considering the nature of the marital treatment, must necessarily have been due to some other cause contributory, and possibly to the gnat fly, the chrysalids of which were present in some of the specimens.

Enations of Ediage of Pterisma aianthoides.—Mr. Worsdell showed foliage of this interesting Himalayan tree belonging to the Simarubaceae, and hardy at Kew, whence the specimens came, having on the upper side of the rachis both at the nodes and along the internodes numerous enations of various forms, some being shaped like a cup or goblet.

Hybrid Calceolarias. Mr. Allard showed hybrids between *Calceolaria alba* and other forms, including *cana*, *integrifolia*, and a garden hybrid of *cana*, *alba* being the pollen parent. In every case, foliage, habit and flower colour were of the pollen-parent type, and in every case they were sterile. This is a remarkable case of almost complete paternal inheritance, *v.g.*, comparable with the known cases of maternal inheritance, *v.g.*, in *Primulas*. *C. alba* itself is sterile so far as the ovules go.

Various Plants. Mr. Elwes showed a number of plants from his garden, including *Astrantia heliophylla*; a very floriferous *Lonicera* of bushy, late-flowering habit, perhaps *L. crata*; *Pelargonium Endlicherianum*, and others; *Theropogon pallidus*, somewhat resembling a large-flowered pink Lily-of-the-Valley, but lacking scent, native of the Himalaya; *Hymenocallis*, *Aristolochia arnithocephala*, strongly scented in the daytime, but scentless at night.

Ants and Lilium regale. Mr. Bowles showed a bud of *Lilium regale* and read the following note:—"A group of this growing in a garden at Norwich has been attacked by ants. The owner of the garden has watched the ants at work on the unopened buds, and has seen them carry away particles of green matter that they have apparently extracted from the flower. They confine their attention in the first place to those portions of the flower that are coloured with the chocolate-brown that comes on *regale* in its early stages. The first effect that is apparent is that the chocolate disappears in patches. As the flowers develop the portions attacked begin to decay, and, naturally, spoil the flower. So far as can be ascertained, no other variety of Lily growing in the neighbourhood has been touched, which would make it appear as though *L. regale* possesses some particular attraction for the pests. It is necessary to find some remedy, as the attacks of the ants are so persistent that a fine group of this beautiful Lily has been ruined within the course of a fortnight." It is probable that a disc of cardboard covered with Tangle-foot fixed round the stem some little distance from the ground would prevent the ants from reaching the flowers.

Change of Colour in a White Currant. Dr. Walter Dick sent a note calling attention to the complete reversion of a White Currant planted against a wall at Great Massingham, King's Lynn, to a red form. For two years prior to the present the plant bore white Currants, but this season all on the bush are red, and rise ten days earlier than those on other bushes in the garden.

Spencer-flowered Cupid Sweet Pea. Mr. G. T. Dickson, Newtownards, sent a Cupid Sweet Pea with waved flowers of the Spencer type, which he had raised along Mendelian lines by crossing (in 1915) a tall Spencer with the ordinary grandiflora type of Cupid Sweet Pea. The new form appeared in the second generation and has bred true since.

TRIALS OF BROAD BEANS AND ANNUAL POPPIES.

The following awards have been made to Broad Beans and Annual Poppies by the Council of the Royal Horticultural Society after trial at Wisley. *Clipper* variety of Mid-season Pea, which received an Award of Merit last year, has been awarded a First-class Certificate after further trial.

BROAD BEANS.

AWARDS OF MERIT.—*Broad Windsor*, from Messrs. Dobbie and Co.; *Exhibition Longpod*, from Messrs. Dobbie and Co.; *Green Giant*, sent by Messrs. Sutton and Sons.

HIGHLY COMMENDED.—*Erdington Gem*, sent by Messrs. Holder and Tilt; *Grant Windsor*, sent by Messrs. Sutton and Sons; *Green Leviathan*, sent by Messrs. J. Carter and Co.; *Green Windsor*, sent by Messrs. Sutton and Sons; *Mammoth Windsor*, sent by Messrs. J. Carter and Co.; *Priestcraft Exhibition Longpod*, sent by Messrs. Bunyard, Ltd.; *Profile Longpod*, sent by Messrs. Sutton and Sons.

COMMENDED.—*Invicta*, sent by Messrs. Nutting; *Market Garden Windsor*, sent by Messrs. J. Carter and Co.

PEA.

FIRST CLASS CERTIFICATE.—*Clipper*, sent by Messrs. Nydenham, Ltd.

ANNUAL POPPIES.

AWARDS OF MERIT.—*Dwarf Scarlet Fringed*, sent by Messrs. R. Veitch and Son; *Scarlet King*, sent by Messrs. Barr and Sons.

HIGHLY COMMENDED.—*Cardinal Blush*, sent by Messrs. Dobbie and Co.; *Cardinal Scarlet*, sent by Messrs. Dobbie and Co.; *Dainty Lady*, sent by Messrs. Barr and Sons; *Danubius*, sent by Messrs. Barr and Sons; *Peacock Poppy* (*P. pavoninum*), sent by Messrs. Barr and Sons; *strain of Dwarf Double Peony-flowered mixed*, sent by Messrs. Barr and Sons; *strain of New Double Queen*, sent by Messrs. Barr and Sons and Messrs. R. Veitch and Son; *unobscured*, sent by Messrs. Dobbie and Co. and Messrs. Barr and Sons; *The Admiral*, sent by Messrs. Barr and Sons; *White Colossal*, sent by Messrs. Barr and Sons; *White Swan* (syn. *Snowdrift*), sent by Messrs. Barr and Sons.

COMMENDED.—*Picotee*, sent by Messrs. Barr and Sons.

ROYAL SCOTTISH ARBORICULTURAL.

JULY 11.—The summer general meeting of members of this society was held at Glasgow on the 11th inst. The summer meetings of the R.S.A. Society have hitherto been held in the showyard of the Highland and Agricultural Society wherever the show might be, but as these shows are in abeyance in the meantime, it was decided, in response to an invitation from the West, to hold certain of the Arboricultural Society's meetings in Glasgow, to take advantage of the opportunity to hold the summer meeting in Glasgow on this occasion. Sir Andrew Agnew, Bart., the president, presided, and there was a general discussion on forestry matters. The discussion was opened by Sir John Stirling Maxwell, Bart., with a paper on "National Forestry," and this was followed by communications on "Barley and Mine Requirements," by Sir Charles Bine Renshaw, Bart., and Mr. C. G. G. Carlow, on "Deer Forests and Sheep Farms," by Colonel Archibald Stirling, M.P., and Mr. D. K. McBeath, B.Sc. More, the two last mentioned papers being read by the secretary, Professor Wm. Somerville, Oxford, who was unable to be present, sent a short note on "Forestry Education," which was also read by the secretary. A discussion followed, and on the motion of Mr. George Fraser, seconded by Sir John Stirling Maxwell, it was agreed that a deputation be sent to the Secretary for Scotland in the general question of the position of forestry. The attendance at the meeting was about 50.

SCOTTISH HORTICULTURAL.

JULY 13. The monthly meeting of members was held in the Guild Hall, 5, St. Andrew Square, Edinburgh, on this date, Mr. Phillips, the president, in the chair. There was an attendance of 55 members.

It was intended to hold a competitive show of Roses and Sweet Peas on this occasion, but owing to lack of entries this had to be abandoned, and in place of it the Council decided to have a special exhibition of Roses (in connection with the paper to be read at the meeting), and vegetables of interest to allotment holders. Messrs. DORRICK AND CO., Edinburgh, staged a fine collection of Roses, and an excellent exhibit of vegetables, and Mr. McHAYLE set up a particularly interesting collection of 13 different varieties of vegetables grown in the city, to illustrate what could be done by allotment holders and others on small areas. The dates of sowing and planting were given, so that visitors could see for themselves what could be produced in a given time. There was also staged from the Public Parks Department a fine collection of Roses. Miss BRUNTON, New Saughton Hall Gardens, Dilton, showed good tubers of *Edenrose* and *Mirabilian Early* Potatoes from sets planted on April 23, and of *Magnam Bonum* Chauliflower. Mr. CRECHTON, Dalhousie Castle Gardens, showed Scotch Peas and Roses, and Mr. J. W. SCARFITT, Sweethope, Inverclyde, exhibited ordinary Pea British Lion. Messrs. DORRICK AND CO. and Mr. McHAYLE were each awarded a Gold Medal, and Miss BRUNTON and Mr. CRECHTON received Cultural Certificates. The exhibits were handed over to the Red Cross Fund.

The paper read at the meeting was by Mr. George Taylor, of Messrs. Dobbie and Co., Edinburgh, and was entitled "The Romance of the Rose." Mr. Taylor traced the development of the Rose, and showed how Rose growing was encouraged by the Romans, by whom it was introduced into Gaul. France, he said, was the birthplace of modern Roses, which were the result of the labours of the old French growers. Ultimately Rose-growing shifted to England, and later to Ireland, which now took the lead so far as new Roses were concerned. In the long history of the Rose, dating back some 2,000 years, the old *Calbidge* Rose was shown to be the variety which linked those of former times with those of the present day.

NATIONAL CARNATION AND PICOTEE.

JULY 17.—This society held its annual exhibition on the above date in conjunction with the R.H.S. fortnightly meeting at the London Scottish Drill Hall, Westminster, and although the display was not a great one either in extent or quality, it was a wonderful demonstration of the patience and perseverance of florists and fanciers during war-time. A large number of interest records that on this occasion all the flowers were shown in vases. Mr. JAS. DODDARIS won the Carnwright Challenge Cup offered for the winner of the highest number of points in the open classes, whilst the Morton Smith Cup was won by Mr. R. PINXOCK as the most successful winner in the third division (amateurs).

In the principal division Messrs. ARTHUR A. BROWN, LTD., King's Norton, led for six bezars and flakes and also for six white-ground Picotees; the flowers were rather small. Mr. H. LAKEMAN, Thornton Heath, won the 1st prize in the class for six selfs with Elizabeth Shiffner; General French, Edinford, Mrs. G. Marshall, Bockham White, and Hilda Black, and succeeded in beating Mr. JAMES DODDARIS. The latter led, however, in the class for six fanics, other than white grounds, with glorions blooms of Lieutenant Slaekleton, Lord Sneyne, Pasquin, Cyclone, Edenside and Mrs. Penton; 2nd, Mr. LAKEMAN; 3rd, Messrs. A. R. BROWN. Mr. H. LAKEMAN excelled in the class for six white-ground fanics, George Robey and Daisy Walker being very attractive; 2nd, Messrs. A. R. BROWN. Mr. JAS. DODDARIS was successful in the class for six yellow ground Picotees with Mrs. Keen, Eclipse, Santa Claus, Exquisite, J. Hasham and Togo; 2nd, Mr. LAKEMAN.

In the second division of the schedule three varieties only were required in each class and three blooms of each. Mr. J. J. KEEN, Southampton, led in this class for bezars and flakes, followed by Mr. FARBLE, Aston. For white-ground Picotees Mr. J. J. KEEN, Mr. W. FROSTER, Narbury, and Mr. JAS. FARBLE were placed in the order named. Selfs were a good class. Mr. H. W. FROSTER won the 1st prize with Mrs. G. Marshall, General French and Daffodil; 2nd, Mr. FARBLE; 3rd, Mr. J. J. KEEN. For three fanics, other than white grounds, Mr. FROSTER beat Miss SHIFFNER, Lawes, and Mr. FARBLE; all showed well. Mr. FROSTER was also placed 1st for three white-ground fanics with Montrose, George Robey and Daisy Walker; 2nd, Mr. B. MOURTON, Woodside Park. Mr. J. J. KEEN had the best yellow ground Picotee in a class for these varieties, followed closely by Mr. FROSTER and Miss SHIFFNER.

In the amateur's division the principal prize-winners were Mr. R. PINXOCK, Ilford, and Mr. S. C. WIM, Thornton Heath.

In the open classes Mr. JAS. DODDARIS led for six new white selfs, with Albion (granted a F.C.C. by the N.C. and P.S.). Mr. FROSTER was placed 1st for six blooms of a dark red or maroon self with Mrs. G. Marshall. Mr. JAS. DODDARIS led in the class for yellow selfs with Sulphur, a beautiful flower; and he was placed 1st for (a) scarlet selfs with the glowing Fujiyama; (b) for buff or terra cotta selfs with Elizabeth Shiffner; and (c) for selfs of any other colour, with The Grey Douglas (deep heliotrope). Mr. FROSTER led for yellow ground Picotees with Eclipse; Mr. R. MOURTON for yellow ground fanics, with Skirmisher; and Messrs. A. R.

BROWN, LID., for fancies of any other ground than yellow or buff, with Betty.

PREFERER BLOOMS.

S.H. Mrs. Percy Smith, shown by Mr. JAS. DOUGLAS, *Fairy Lord Steyer*, shown by Mr. H. LAKEMAN, *Yellow-ground Peacock Togo*, shown by Mr. JAMES DOUGLAS, *Bicolor*—Master Fred, shown by Mr. J. J. KEEN, *White-ground Peacock*—John Smith, shown by Mr. J. J. KEEN, *Yellow-ground Peacock (light edge)*—Eclipse, shown by Mr. J. J. KEEN, *White-ground Fairy*—Daisy Walker, shown by Mr. JAS. DOUGLAS.

Obituary.

JOHN YOUNG.—*Horticulture*, U.S.A., records the death of Mr. John Young, a native of Scotland, gardener to Col. Samuel P. Colt, at Bristol, Rhode Island.

CROPS AND STOCK ON THE HOME FARM.

SWEDES AND MILDEW.

ON the whole, the seed of Swede Turnips has germinated well and the plants are healthy. No time should be lost in thinning them to the proper distance apart, as overcrowding by either too many plants in the rows or by weeds would cause a serious check to growth that would favour the development of mildew later. This malady is one of the worst pests of Swedes. Not only does mildew injure the leaves, checking the growth, but it impairs the keeping properties of the roots during the winter, for even if frost does them no harm, the flesh becomes tough and hard. Directly the plants can be seen in the drills, the horse hoe should be freely used to stir the soil about them. Should the seedlings make quicker progress than the labour can cope with in setting them out, or even horse-hoeing them, harrows should be drawn across the drills. This will move the soil and pull out a few plants, which will serve until they can be set out to a proper distance of 18 inches.

Owing to peculiarities of soil in various parts of even one field, the plants do not always progress evenly, whilst wireworms and other insect pests may be troublesome. Over such faulty places sprinkle sulphate of ammonia at the rate of $\frac{1}{2}$ cwt. per acre, or a good quantity of soot.

MANGOLDS.

Mangolds never looked more promising than they do at present. The plants are growing apace, and although they may be several inches in diameter, the stirring of the soil between the rows will further accelerate growth. In late-sown plots, or where the plants are backward in growth owing to various causes—shortage of manure in the soil, weeds in the early stages of growth, or late sowing—a dressing of sulphate of ammonia at the rate of 1 cwt. per acre, or half that quantity of nitrate of soda sown when the leaves are dry, will give a fillip to growth.

SHEEP FOR STOCK.

Never has the beneficial result of keeping a flock of sheep been more apparent in the corn crops than this season. Oats especially displayed signs of weakness owing to late sowing, and a spell of dry weather during April and May, that the straw did not promise more than 1 foot of growth. Where the previous crop was late-sown Turnips, for example, and sheep fed on the ground Oats since the rain in June have made remarkable progress. The present dense green of the flag, with the lengthening ears, all display the benefit of the manure from the sheep. I notice that where there were no sheep the Oat growth is much promising but few stacks of corn per acre.

As the mating season for lambs born early in January commences early in August, no time should be lost in selecting the rams—one to fifty ewes is sufficient. The best kind of sheep to breed is purely a matter of circumstance. No breed can equal Hampshire Downs where close folding for cereal crops to follow is the main

aim in keeping sheep. No other breed produces lambs of the size and quality in so short a time. For example, lambs born in January this year were sold in May for 5 guineas each. The South Down breed no doubt gives higher quality flesh, but the animals are not so suitable for close folding, especially on wet land. Where grass land only is available Scotch sheep are to be preferred.

THE PLOUGHING UP OF GRASS LAND FOR CEREAL CROPS.

To obtain the 3,000,000 additional acres of land for the 1918 cereal crop which the Government is asking farmers to crop is agitating the farming community. As chairman of an advisory committee, to which is delegated the function of obtaining the necessary acreage in each county, I know much of the difficulties that arise in obtaining this large increase in one season. Landowners and farmers are willingly helping in the scheme, although such a change in method means personal inconvenience and outlay.

I constantly see successful results from the ploughing up of grass land last autumn and spring that I do not hesitate to say there need be no need to question the success of the scheme. For instance, a grass field that never grew sufficient grass for a hay crop and not much for stock is now promising 60 bushels of Oats per acre. Naturally, I am not in favour of ploughing up good grass land to the detriment of the milk supply or the rearing of young stock, but grass that never gives more than one ton of hay per acre and subsequent feed for the cattle would be more profitable under the plough. *E. Midgour*

REPLY.

CROPPER BROAD BEAN.

In reply to J. W. J. (see p. 40), the Cropper Broad Bean was raised by Messrs Bell and Bielestedt (now David Bell), Leith, some years ago. It is a cross between Aquadule and Bunyard's Exhibition. I saw a large break of this particular Bean at Mr. Bell's trial grounds a week or so ago, and it is full of promise. *J. J. S.*

ANSWERS TO CORRESPONDENTS.

CABBAGEFLIES: *B. N. J.* No. 1 is the Cabbage-moth (*Alamastira brassicae*). You should pick the caterpillars by hand, and also gather and destroy any curled or injured leaves. As a preventive of further attacks, dust the ground with soot and lime. The chrysalids remain in the ground all the winter, and may be seen and destroyed when digging the soil preparatory for the seedlings. No. 2 is the Pear-Leaf Tent Sawfly (*Pamphilius flaviventris*). Hand-pick the trees, and spray with Bordeaux mixture in the spring, just when the fruit-buds are opening. No. 3 is the larva of another sawfly, probably a species of *Empythus*, for which the treatment will be the same as for the *Pamphilius*. The Peas have been attacked by thrips (*Katathrips robusta*). Spray the plants with a mixture of nicotine and soft soap, in the proportion of 2/3rds of an ounce of nicotine and 6 oz. of soap to 10 gallons of water.

GOOSEBERRY BUSHES DYING: *E. Y.* The Gooseberry bush is affected by "Die-back" disease, caused by the fungus *Sclerotinia*. Cut out and burn all the dead shoots. If the plant is badly affected it should be grubbed up and burned. The disease is not a difficult one to keep in check if these measures are adopted.

LARKSPURS: *X. Y. Z.* The trouble is not caused by organic disease. The unsatisfactory state of the plants is due to unsuitable conditions.

MONARCH PLUMS NOT FRUITING WELL: *T. H.* Monarch is usually a shy fruiter, mainly because birds are particularly fond of the buds of this variety. This season, however, very little bud-eating took place, probably because fullinches and sparrows were killed to a great extent by the prolonged severity of last winter, and in some districts, at any rate,

the crop is the best for many years. After every New Year's Day the trees should be inspected twice in every week, in order to detect the beginning of an attack of bud-eating, so that spraying profusely with lime-sulphur may be promptly done. Where there are long lengths of branches made permanently bald by bud-eating, benefit might result from cutting them back to live buds, but this would not be of any avail without protecting the new growths by spraying when needed. Lime-sulphur sticks on the trees well, but if washed off by heavy rains a second spraying may be necessary.

NAME OF FRUIT: *H. W.* Apple Mr. Gladstone.

NAMES OF PLANTS: *Horstead*, 1, *Lythrum salicaria* (Purple Loosestrife); 2, *Asclepias curassavica*—*J. U.* *Sempervivum tortuosum variegatum*. The species is a native of the Canary Islands, and not quite hardy in this country.—*U. C.* *Calycanthus floridus* (Carolina Allspice)—*M. D. G.* *Coronilla Scopioides*, of Koch, it is the *Ornithopus Scopioides* of Linnaeus, and has various other names. The species is a native of France and the Mediterranean region, not of Britain, where it occasionally appears as a casual. The seed had been brought to your garden, most likely, in the soil on the roots of the Roses.

OPICUM POPPY: *Laxious*. Opium is obtained from the seed capsules of *Papaver somniferum*. The seed heads are scarified when fully grown but still in a green state, and the juice, which soon hardens, is scraped off and formed into balls. This is the crude opium, the active property of which is morphia. The Poppy-heads are also dried and employed in fomentations.

POTATOS: *Rev. B. W.* The trouble is not due to organic disease; there is certainly no trace of late blight, *Phytophthora infestans*. We have seen similar cases of failure with Potatoes this season, which may be attributed either to an unsuitable condition of the seed tubers at the time of planting or to unsatisfactory weather.

ROSES AT BAGATELLE: *C. W.* Varieties of Roses grown under trial at Bagatelle, near Paris, are sent by raisers, not only in France but in other countries, and therefore they would probably include some that had already been sent into commerce. You ask whether they are any improvement on the large number of varieties sent out during the past four or five years; it is obvious that those sent to Bagatelle include many of the finest new sorts. Gold medals were awarded to Constance, Mrs. Wemyss Quin, Admiral Ward, and Gloire des Belges in 1916. You would probably be able to obtain a list of the awards made during the years you mention, on application to The Curator, Roseraie de Bagatelle au Bois de Boulogne, en gare de Neuilly-Porte-Maillot-Paris.

ROSES UNHEALTHY: *H. J. W.* No fungus or insect pest was present on the shoots. The appearance of the plants points to trouble at the roots. Try watering with some liquid fertiliser rich in nitrogen, such as that obtained from the farmyard. This treatment will probably restore the green colour to the foliage.

VINES WITH YELLOW FOLIAGE: *E. J. C., Cork.* Your vine leaves, which you say are from the centre of the house, appear to be suffering from an insufficiency of light, and if you find that any exposed shoots on the same vine are not suffering so much, it will confirm our suspicion. If this is so you should very gradually remove some of the ends of the shoots to admit light to the primary leaves. Vines in this condition will not need so much water as those which are healthy. Try the effect of a little sulphate of iron dissolved in water, at the rate of a quarter of an ounce to the gallon, and the same quantity of sulphate of ammonia, nitrate of soda, or nitrate of potash (saltpetre). One gallon of this will be sufficient for a square yard of border, and if the roots are healthy will probably improve the colour of the leaves.

Communications Received.—*Ignorance*—E. B.—A. J. G.—J. M. F.—E. G.—J. C. B.—S. P. C.—H. B. M.—J. F. McL.—A. R. W.—R. Kidd—M. D. G.—G. B.

MARKETS.

COVENT GARDEN, July 27.

We cannot accept any responsibility for the subjected reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—Eos.

Table with 3 columns: Plants in Pots, Average Wholesale Prices, and various plant names like Aralia Sieboldii, Asparagus plumosus nanus, etc.

Table with 3 columns: Cut Flowers, Average Wholesale Prices, and various flower names like Asters, white, per doz. bun., Carnations, per doz. blooms, etc.

Table with 3 columns: Cut Foliage, Average Wholesale Prices, and various foliage names like Adiantum (Maidenhair Fern), Asparagus plumosus long trails, etc.

REMARKS: Asters are in increasing numbers. There is a good supply of double white stock, which is arriving in excellent condition. Carnations are exceedingly

planting and plants of second quality are difficult to obtain. Euphorbia angustiflora is reaching unusually high prices. At the time of our issue, Lavender is arriving in large quantities, also topophilia paniculata and the double white variety. It is preferred to the common sort because of its fragrance. S. sinensis and S. longifolia is now of its best, and both are so scarce the supply being very irregular. There is no new supply to record this week, and very little variation in prices generally. With the exception of Lilies, other flowers are likely to be cheaper during the next few days.

Vegetables: Average Wholesale Prices

Table with 3 columns: Vegetables, Average Wholesale Prices, and items like Artichokes Globe, Beans Broad, per bus., etc.

Fruit: Average Wholesale Prices.

Table with 3 columns: Fruit, Average Wholesale Prices, and items like Almonds, per cwt., Apples, per case, etc.

LADY GARDENER, fully trained, seeks (or is sought) as STENOGRAPHER, or with others. Inside or outside, would like to remain in work if near London. Comfortable accommodation, essential. Write, C. G., Box 12, 41, Wellington Street, Covent Garden, W.C. 2.

EXPERIENCED LADY GARDENERS require work by the day or by hour. First class work, London, excellent remuneration. T. F., Box 16, 41, Wellington Street, Covent Garden, W.C. 2.

TWO LADY GARDENERS, with experience, Inside and Out, in great post as Joint Working Head for Head and Forewoman, end of September, good cottage and home countries, essential. T. B., Box 8, 41, Wellington Street, Covent Garden, W.C. 2.

TWO LADY GARDENERS, with practical experience and good references, require post to 25th Middle Road, E. for Gardeners in South of England preferred.—K. M., 4, Convent Cottage, Cook, Rugby.

LADY GARDENER, free early September. 10 sents post near Brixton, 1 year's training, R.H.S., Greenhill, Epsom, in small garden; live in preferred.—CANNON, 47, West Park, Chiswick.

LADY GARDENERS (4 or 5) 2 years' practical and scientific training, with diploma, seek post in September, preferably together, in private or Market Garden. MISS MICHAEL, University College, Basing.

LAD seeks situation, Inside or Outside and (or) age 15, no experience. Both preferred; strong and willing to learn. P. CREASEY, 1 Brixton Cottages, Brompton, Kent.

MR. E. NORWOOD can with confidence recommend W. ALTON, his Employer (Inside), for a situation in a large establishment, 3 years' experience. Mr. W. ALTON, Winklers Wood Gardens, Woodhatch, Surrey.

GREENHOUSE PAINTING. Capable and reliable man is open to engagement; contract or otherwise. Full particulars to GRANT, 197, Drummond Street, Hampstead Road, London, N.W.

TRADE.

NURSERY FOREMAN or MANAGER: 12 years' active, all-round experience growing for London and provincial markets, over 100 varieties, married; aged 22. State terms. C. WILSON, Granville Nursery, Ditch Lane, Brixton.

RETIREE MANAGER FOREMAN (Widow) has 20 years' period, high marks in engagements, 10 years' experience, extensive knowledge, special 4000 plants, 2000 varieties, extensive residential, 8, Post 41, Wellington Street, Covent Garden, W.C. 2.

OWING to the residents leaving the City, a situation is vacant in a good NURSERYMAN, and seeks situation, well up in all branches in particular, in a good place, preferably in a good cottage and home countries, essential. T. B., Box 8, 41, Wellington Street, Covent Garden, W.C. 2.

CLIMBING PLANTS

(Present-Day Gardening Series) By WILLIAM WATSON. (Introduction by William Robinson.) A Practical Handbook on the Treatment of Climbing Plants, both hardy and tender species. Illustrated with 24 full page plates, 8 of which are reproduced in colour. Price 2/10 post free from: THE PUBLISHING DEPT., "GARDENERS' CHRONICLE" OFFICES, 41, Wellington Street, Covent Garden, W.C. 2

Front page (no display allowed) 1/4 per line space. (Headline counted as two lines). For discounts apply to address below. SITUATIONS WANTED. 26 words 1s. 6d., and 6d. for every additional 8 words or fewer. These Advertisements must be prepaid, AND APPLY ONLY TO GARDENERS, &c., OUT OF EMPLOYMENT. SUBSCRIPTIONS. THE UNITED KINGDOM ... 15/- per annum. ABROAD ... 17/6. Cheques and P.O.s to be made payable to "GARDENERS' CHRONICLE," LTD., 41, WELLINGTON STREET, COVENT GARDEN, LONDON, W.C. 2. Telegrams: 1543 "GARDENERS," KANS, LONDON. Telephone: 1643-GERARD.

A TREASURY OF INFORMATION

is contained in the

HORTICULTURAL DIRECTORY AND YEAR BOOK.

Nowhere else can the gardener obtain, within the small compass of four hundred pages, so much information on the subjects which interest him most. The knowledge which this little work contains is just what is indispensable to the gardener in his daily life. The

CALENDAR OF GARDEN OPERATIONS

takes him through the whole year, reminding him of the manifold small cares which make all the difference between health and ill-health in his plants. It also reminds him of the exhibitions which are to be held and of the most important annual meetings.

Another interesting section, which expands each year, is the list of

SCHOOLS OF HORTICULTURE.

with a brief description attached to the name of each such institution. Those concerned with the education of young gardeners—both men and women—will turn to this section with especial interest, and those who are seeking such education will find it of the greatest assistance in deciding which school to select. There are still for sale a few copies of the current edition.

SPRING CABBAGES—The best varieties for sowing now.

SUTTON'S HARBINGER CABBAGE

The grandest Cabbage for Spring Cutting. Per plant 1s. 6d. per 100, 1s. 6d. per 100 of Autumn Cabbages. A trial or two less than 1s. 6d. per 100, 2s. 6d. per 100, 3s. 6d. per 100. Last year the *Harbinger* proved that Sutton's Harbinger is the best. Sowing that did well in both trials (Ammersdown and Springfield). The Field, June 17, 1916. Cabbage Harbinger is a rapid variety. It sowed on 25th Jan. in 1917, and was ready for market on 10th Feb. It can be sown in any soil. Mr. A. P. Cole, the gardener, Walsley, Cheshire.

SUTTON'S APRIL CABBAGE

The most popular early Cabbage for garden use. Per packet 1s. 6d. per 100, 1s. 6d. per 100. The April Cabbage can supply all needs. It last year was a splendid variety. A plant has been produced by the same variety, and they are now coming to the market. The Rev. J. J. Briggs, May 3, 1917. The April Cabbage is a rapid variety. It sowed on 25th Jan. in 1917, and was ready for market on 10th Feb. It can be sown in any soil. Mr. H. Bayart, Froulde, Kent.

SUTTON'S FLOWER OF SPRING CABBAGE

The most reliable for the general Spring crop. Per packet 1s. 6d. per 100, 1s. 6d. per 100. Mr. J. J. Briggs, May 3, 1917. The Flower of Spring Cabbage is a rapid variety. It sowed on 25th Jan. in 1917, and was ready for market on 10th Feb. It can be sown in any soil. Mr. H. Bayart, Froulde, Kent.

SUTTON & SONS, The King's Seedsmen, READING.

IT IS OF NO USE waiting until the war is over to advertise your wares. Even if you find it difficult to supply your customers, on account of shortage of staff and difficulties of transit, you should not cease to advertise. When peace is declared, there will be at any rate for a time, increased activity in every branch of industry. When that time comes, with whom will your customers deal, with the man who has not advertised for three years, and whose very name they have forgotten, or with the man who, by persistent and persistent advertising, has kept his name before the public? Merchants are short, and people whose names are out of sight are also out of mind. After the war all your competitors will be struggling to obtain the business with which everyone will then be in a better position to cope. Are you going to miss your chance?

GREENHOUSE PAINTING & GLAZING

"Agrotic" superior to White Lead Paint. "Plastino" superdurable putty. Full particulars from **W. CARLSON & SONS, Grove Works, BATTERSEA.** Agents throughout the country.

THE Gardeners' Chronicle

No. 1597.—SATURDAY, AUGUST 4, 1917.

CONTENTS.

Table listing various garden-related items and their page numbers, including bottles for preserving fruit, orchid notes, and remarks on garden conditions.

ILLUSTRATIONS.

Table listing illustrations such as grapes, raspberries, and plum varieties with their respective page numbers.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See also Tables in Gardeners' Chronicle for July 26.)

1. SCOTLAND, N.

ROSS SHIRE.—Owing to the coldness of the year, Pears and Plums have failed with us this year. Small fruits are fairly good. The soil here is cold and damp.

2. SCOTLAND, E.

SETHLERSHIRE.—Apples, Pears, Plums and Cherries are almost total failures. Raspberries, Black Currants, and Gooseberries are only much below average.

3. SCOTLAND, E.

ABERDEENSHIRE.—Strawberries and small fruits have been satisfactory, but later than usual. Fruit trees in general are poor, last autumn being so wet the fruit buds failed to mature properly.

4. SCOTLAND, E.

BERWICKSHIRE.—The fruit in this district is very good on the whole, although Plums are scarce in some places.

5. SCOTLAND, E.

Apples in this district are good. Pears and Plums average. Cherries, Peaches, and Apricots are bad. Strawberries, Red and Black Currants were plentiful and of good quality.

6. SCOTLAND, E.

EAST LOTHIAN.—Fruit crops, with the exception of Currants, Gooseberries, Raspberries and Peaches, are very disappointing. Strawberries looked well, but the long drought rendered them almost worthless on light soil.

7. SCOTLAND, E.

FIFE.—Pears, Plums, and Cherries never looked better when in bloom, but were destroyed by cold, frosty nights. Apples on some trees are in abundance; on others there is none.

KINCARDINESHIRE.—The fruit crops, except Plums, are looking very promising. The soil here retains moisture for a long period, being rather firm, but does not crack.

LINLITHGOWSHIRE.—The fruit crop in this district is fairly good. Trees and bushes are in a healthy condition.

MIDLOTHIAN.—The wet and sunless autumn and cold winter continued into April, when the most severe frost was experienced, causing fruit blossom to be unusually late in opening.

8. SCOTLAND, W.

ARGYLSHIRE.—Apples and Pears bore a profusion of blossom, but inclement weather prevented good sets. Black Currant Boscop Giant had a splendid show of blossom.

The fruit crops in this district are less than usual this season, but of good quality. When the Apples were in full bloom we experienced a spell of cold, frosty nights; this occurrence greatly depleted the blossom.

ARGYLSHIRE.—The fruit crops, with the exception of Raspberries and Strawberries, are very satisfactory but two-thirds of the Raspberry canes were killed by severe frosts in January and February.

Apples and Pears blossomed well but caterpillars destroyed most of the bloom. Small fruits were late.

STIRLINGSHIRE.—Owing to the lateness of the spring, fruit trees did not come into bloom quite so early as usual, and thus they escaped injury from frost.

WILTSHIRE.—Strawberries promised well early in the year, but drought checked the swelling of the fruit, which was small.

9. ENGLAND, S.E.

DURHAM.—All fruits are under the average excepting some of the later varieties of Apples, namely, King of the Pippins, Alfriston, Cellina, and Bismarck; these are bearing heavy crops.

NORTHUMBERLAND.—The fruit crops this year are fairly satisfactory. Some varieties of Apples are laden with fruit, while others have none.

Pears and Plums are yielding light crops. Cherries and Peaches are plentiful. Gooseberries, Black Currants, Red Currants, and Raspberries are very good.

YORKSHIRE.—The fruit crops, especially Strawberries, suffered from drought on this light soil. Trees and bushes show remarkably clean growth.

All bush fruits are good, especially Gooseberries, Red Currants, and Raspberries. Strawberries yielded light crops owing to the exceptionally dry weather.

Owing to the cold spring fruit trees flowered much later than usual, but a severe frost on April 2 damaged many of the unopened flower buds of Pears, Apricots, Plums, and Peaches.

With the exception of Raspberries, Black Currants, and Gooseberries, the fruit crops are very light. There was an abundance of Apple blossom, but the very hot, dry weather at the time of setting caused it to fall.

10. ENGLAND, E.

CAMBRIDGE.—Fruit crops are good, with the exception of Strawberries. These suffered from the dry weather which set in just as the fruits began to swell.

The fruit prospects were excellent until the long spell of hot, dry weather cured many Apples, Pears, and Plums to drop. Since the rains the remainder have swelled rapidly.

11. ENGLAND, S.E.

ESSEX.—Apples in this district are a surprise. There was every prospect of a very heavy crop, but owing to the hot, dry weather, in some places they have not come up to expectations.

Our Apple crop is quite a failure; with the exception of two or three trees carrying very moderate crops, not an Apple can be seen. I am at a loss to account for this.

was very much under average, and there was every reason to anticipate a record crop this year. Caterpillars have been a plague, and may have had something to do with the failure. Plums, Peaches, and Nectarines are also very scarce. Strawberries of the later varieties have done much better than at one time I thought they would, but Royal Sovereign ripened before the fruits were properly developed, and lacked flavour. Currants of all kinds, and Gooseberries, have yielded heavy crops. The soil is a stiff, yellow clay. *Arthur Bullock, Copped Hall Gardens, Epping.*

— The fruit blossom here was abundant, but much fruit has dropped. The trees have been remarkably free from aphids, but caterpillars have

but did not set, the damage to the essential parts of the flowers being very apparent. *E. C. Norris, Elsham Hall Gardens, Elsham.*

— The fruit is not equal to the average. The dry weather of May and June caused the Apples to drop, and orchard trees are carrying very little fruit. Peaches and Nectarines set well, and are carrying full crops. The same is true of bush fruits, but Plums are scarce; while one tree may be loaded the next dozen bear hardly any fruit. *F. J. Foster, Grimsthorpe Castle Gardens, Bourne.*

— We have very light crops of Apples, Pears, and Plums. Some varieties have not a single fruit. Dessert Cherries are good. Apricots are bearing a good crop. We have a quantity of

FIG. 16 - A RENOVATED VINE BORDER

been rather abundant. The soil generally is heavy. *C. Wakely, County Gardens, Chelmsford.*

HUNTINGDONSHIRE. — Apples and Pears are carrying heavy crops of clean, even fruits. Plums and Cherries are a fair average, and the trees are free from aphids. Raspberries and Currants are heavily cropped, but Strawberries have been a comparative failure owing to the hot, dry spell in April and May, which also caused a bad attack of red spider on Gooseberries. The Fen soil is peaty, over clay, the high land a stiff loam generally, with a clay subsoil. *I. F. Coombe, Ramsey Abbey Gardens, Ramsey.*

LINCOLNSHIRE. — The fruit crops generally are a good average. The show of fruit blossom was the best for some years, but the 25th of frost registered on April 15 damaged a portion of the blossom prior to opening. The flowers opened,

Gooseberries and Currants, there are some Red Currant trees here over 60 years old looking the picture of health, and carrying a heavy crop of fruit. *Thomas Cox, Brandon Hall Gardens, Lincoln.*

NORFOLK. — Plums and Apricots flowered well but set very few fruits. Black Currants, Raspberries, and Gooseberries are all carrying excellent crops. Insects have not been so troublesome as in past years. Ours is a light, sandy soil, with a gravelly subsoil. *Isaiah Johnson, Cutton House Gardens, Norwich.*

SUFFOLK. The present is a good fruit year all round. No crop is a complete failure. *E. G. Clark, Holt Inst., West Suffolk C.C., Shire Hall, Bury St. Edmunds.*

(To be continued.)

ORCHID NOTES AND CLEANINGS.

NEW HYBRIDS.

ODONTOGLOSSUM CORINNA. — A fine inflorescence of a stately hybrid raised between *Odm. Rolfeae* (*Harryannum* × *Pascuatori*) and *Odm. tigrinum* (*Harryannum* × *Pascuatori*) is sent by Mr. F. C. Puddle, gardener to W. H. St. Quintin, Esq., Scampston Hall, Rillington, York. The flowers, which naturally have *Odm. Harryannum* as the chief feature, are three inches across, all the segments being broad and of fine substance. The sepals and petals are pale yellow, the inner three-fourths having broad, irregular bands of chestnut-red, with a violet shade at the bases of the petals. The lip, which is one inch broad, has a very complicated yellow and purple crest. The basal half is rose-purple, the front yellowish-cream colour.

CATLEYA EGERIDES. — This is an attractive flower of medium size in its class. It is from a cross between *Cattleya Walkeriana* and *C. Downiana aurea*, and is sent by Mr. Puddle. In colour it is nearest to *C. Walkeriana*, showing little influence of the other parent except in the form and undulation of the petals and lip. The sepals and petals are of a light rosy-lilac colour, the front of the lip being rose purple, with thin, white veining at the base.

METHOD OF RENOVATING A VINE BORDER.

The illustration in fig. 16 shows the method of renovating a vine border adopted in the gardens at Heaton Grove, Bury, Lancashire, the residence of James Byrom, Esq. Previous to the alteration, the roots of the vines are said to have been in a very unsatisfactory condition, with the result that many of the bunches were affected with shanking in the berries. The vines are twenty years old, and were originally planted in a border 5 feet 6 inches deep and 3 feet wide. In order to restore them to a satisfactory condition of health, the old soil was removed in a sloping direction—as shown in the illustration—the roots lifted, laid on the slope of the border with old soil beneath them, and covered with a layer one and a half inch deep of fresh loam mixed with bone meal. The fresh soil was finally covered with stones. The stones, obtained from a gravel pit, were rather larger in size than cricket balls, and they serve to keep the roots moist without resorting to frequent waterings.

When the fruits were set this season, the vines were fed with liquid manure from the farmyard and a small amount of artificial manure, which was scattered on the stones once a week. It is claimed that the advantages derived by this novel method of renovating the border are: (1) Saving of labour in watering, (2) the small quantity of fresh soil needed to cover the roots until the vines have made another year's growth (3) the encouragement of surface rooting, (4) the use of only a small amount of stimulant which is directly absorbed by the new roots. Each season an addition of one and a half inch of fresh soil will be added, and the stones replaced in position. It is calculated that it will, with this small addition of soil annually, take at least sixteen years before the border is restored to its former level. Mr. Richard Kidd, the gardener at Heaton Grove, states that the strength of the new growth is double that of last year, whilst the leaves and fruit are as satisfactory as could be desired, there being not one shanked berry.

SWEET LAVENDER. — Lord Arthur Hill is collecting Lavender from country gardens to be sold in various towns in aid of the Y.M.C.A. Auxiliary Maintenance Fund for Huts and Miss Lena Ashwell's "Concerts at the Frank." The receiving office is at 101, New Bond Street, London, W., and any quantity is most gratefully received and acknowledged.

PRUNUS PSEUDO-CERASUS, LINDL.

In his valuable book, *The Trees and Shrubs Hardy in the British Isles*, Mr. Bean remarks, referring to *Prunus Pseudo-cerasus*, that "The typical form of this Cherry, first described in 1826 by Lindley, in Vol. VI. of the Transactions of the Horticultural Society, is probably not now in cultivation." It may, therefore, be of interest to point out that there is a fine tree in the Cambridge Botanic Garden, first confirmed as correct by the late Mr. G. Nicholson, Curator at Kew, some years ago. It measures 14½ ft. high and 14½ ft. through. In a manner not easily understood by the very slight degree of similarity between them, various double forms of *P. serrulata* have been referred to this very distinct *P. Pseudo-cerasus*, and as the error is not infrequent I think it important to point out some special characteristics of the latter, Lindley's original specimen, which I have carefully observed, is in the Cambridge Herbarium. The accompanying illustration of living flowers (fig. 17) is from a photograph taken on February 15, 1916, and the tree had already been in flower at least a week, while *P. serrulata*, in its various forms, flowers in April and May. Under this last mentioned species Mr. Bean remarks that *P. Pseudo-cerasus* is always to be recognised in any of its forms by the hairy leaves and flower stalks. Such, indeed, is the case, and I have picked up dead leaves of both species from beneath the trees which, until dry, could easily be distinguished by touch in the dark, and I think also it might be added by noting the different outline, *P. serrulata* being the narrower of the two and having a long acumen. Flowering, as it often does early in February, *P. Pseudo-cerasus* is unfortunate, as the flowers here are more often than not disfigured by frost. This year, temperatures down to 10.5° Fahr. in February killed practically all the flower-buds, so that there were only a few not quite normal flowers, but the shoot-buds were quite uninjured, and indeed temperatures down to zero in years past could have done much harm to the tree. It may be regarded as perfectly hardy, and the young leaves which come out later than the flowers have never shown evidence of injury. The trees are sometimes beautiful for a time when the weather is mild. It has the peculiarity of being in green leaf mood later in the year than *P. serrulata*, so that the trees are very conspicuously different in autumn. On November 8 the leaves were green, with no sign of turning yellow, while those of *P. serrulata* were yellow and falling. At this date they were glabrous below except for the midrib and veins, but with a distinctly velvety upper surface, due to very short hairs, not easily seen without a glass, but easily felt. In outline the leaf-blades are broadly ovate or obovate, rather abruptly acuminate, and doubly and rather irregularly serrate (see fig. 15). The leaf-stalk is distinctly hairy and about half an inch in length. In contrast with this the leaf-stalk of *P. serrulata*, as I have found it in several of the doubles, is an inch or even 1½ inch long. The leaf-blades of *P. serrulata* on the date above-mentioned were perfectly glabrous on both surfaces. In outline they are ovate, with a long graduated point regularly and not doubly serrate, the serrations fine pointed.

The inflorescences, which usually occur in clusters of eight to twelve, as shown by the illustration (fig. 17), consist of a short raceme or corymb of from five to eight flowers. The bracts are small and jagged, those of the upper flowers minute and still jagged, in neither case clearly glandular. The stalks and calvies are dark reddish red, the stalks are hairy, and the calyx tube appears to be glandular. The corolla is ¾ inch across, the petals are ¾ inch or a little less in length, and a ¼ inch

or a little more in breadth, notched in a way that suggests a W at the top, or it may be said that it is notched with a tooth in the middle. There may be more than one tooth, but there is always at least one. The stigma for want of a better word, may perhaps be termed calyciform; it is not solid and capitate, but forms a little irregular cup, with thin, spreading sides.

Lindley's type specimens of both *P. Pseudo-cerasus* (nos. 19 and *P. serrulata* no. 21) are in the Cambridge Herbarium; but, unfortunately, that of the latter is without flowers. The photographs from which these

are glandular, while in the former it is hardly certain in any case of a gland can be found; in *Pseudo-cerasus* the feather veins are ⅜ inch apart, while in *P. serrulata* they are not more than 3-16 inch apart; in *Pseudo-cerasus* the leaves are not glaucous below, while in *P. serrulata* they may be so described; in *Pseudo-cerasus* the serration is clearly double and slightly coarse, while in *P. serrulata* the serration is much finer and not double. Less conspicuously, but quite clearly, it is evident that the petioles of *P. Pseudo-cerasus* are finely hairy, while those of *P. serrulata* are glabrous. The hairiness of the leaf of *P. Pseudo-cerasus* is not so

FIG. 17. PRUNUS PSEUDO-CERASUS, LINDL.

flowers have been prepared I have been kindly allowed to take for the *Gardener's Chronicle* by Professor A. C. Seward, Master of Downing College. These specimens are on separate sheets, and Lindley, no doubt, regarded them as quite distinct. According to Nicholson, it is Professor Maximowicz who must have the credit of uniting them; but, as Nicholson remarks, Maximowicz had not seen the specimens. These type specimens differ conspicuously in the following particulars. In *P. Pseudo-cerasus* the petioles are about ¼ inch long or sixteenth less or a sixteenth more, while in *P. serrulata* they are from ¾ inch to an inch long, and in this they

coincide; evidently, I think, because the hairs collapse when dry. In the fresh leaf the degree of hairiness appears to vary.

In the autumn I picked up leaves from the ground very evidently hairy, both to sight and touch, which, on becoming dry indoors, seemed to lose almost all evidence of being hairy. Referring again to the type specimens, it may be of interest to remark that while the leaves of *P. Pseudo-cerasus* tend to breadth above the middle, the specimen of this species alone could show an ovate leaf, i.e., with greatest breadth below the middle. Variation of outline may, of course, be expected in both species. R. Irwin Lynch, Botanic Gardens, Cambridge.

TREES AND SHRUBS.

THE SANDALWOOD TREE OF JUAN FERNANDEZ.

In his interesting sketch in the *Gardeners' Chronicle* (Vol. LXI., pp. 199, 209, 220, 250, 251) of the history of this remarkable island, or, rather, group of islands, Mr. Hutchinson refers to the approaching total extinction of the endemic Sandalwood tree. When preparing the Flora of Juan Fernandez for the Botany of the *Challenger* Expedition in 1885, I had to deal with the obscure Sandalwood, of which there are many records by mariners from early in the seventeenth century onwards, and by botanists from Molina (1782) and Gay (1830). No botanical collector had seen a living example of the Sandalwood, though half petrified trunks of what was held to be Sandalwood existed in abundance in certain localities. But absolute certainty that these remains were those of a genuine Santalum was not attained before 1888, when F. Philippi received a bunch of twigs bearing leaves and very young flower-buds from a correspondent in Juan Fernandez. The material was sufficient to determine the genus, and Philippi described and figured the plant as Santalum Fernandezianum. Gay had referred it to the East Indian *S. album*, a very different species. Philippi generously sent some of his fragments to Kew, so that I was able to make comparisons with other Pacific Islands species, and it is nearly related to *S. Freycinetianum*, which inhabits the Society, Marquesas, and Hawaiian Islands. Mr. F. Johow, author of the excellent *Estudios sobre la Flora de las Islas de Juan Fernandez* (1896), spent much time in the islands, and specially searched for living evidence of the Sandalwood, and eventually saw one living tree, discovered by a resident. This tree was in a decaying condition then, and Skottsberg found only one little bunch of green on it in 1908. The existence of a genuine Santalum in Juan Fernandez is a highly interesting fact in plant geography, because no species is known to inhabit the American continent, and the nearest Pacific Island station for the genus is the Marquesas group, about 3,500 miles distant. Santalum ranges from Australia through Malaya to India, and the allied *Fusanus* is apparently restricted to Australasia. *W. Botting Hemsley.*

FOOD PRODUCTION IN FRANCE.

MARKET-GARDENING IN THE PARIS SUBURBS.

AN interesting account of the intensive cultivation carried on by market gardeners in the neighbourhood of Paris has recently been given by M. Paul Vincey, Professor of Agriculture for the Department of the Seine. How intensive is the cultivation may be judged from the fact that so many as five—or even seven—crops, successional and inter-crops, are taken from the same ground in a year. The total annual crop amounts to 20 tons, of a value of £1,000, per 2½ acres. Hence the 2,000 acres under intensive cultivation in the Department of the Seine produce annually 160,000 tons of vegetables, of the value of 20 million francs (£800,000).

Each of these highly productive market-gardens consists of an enclosed garden of about 50 rods, well provided with water laid on in pipes and delivered under pressure from a raised reservoir. The rental value is from £50 to £80 a year. The work is done by five or six persons working from twelve to fifteen hours a day, according to the season. The establishment is generally provided with a horse for the transport of vegetables to Paris and to work the water-pumping machinery; but motors are being installed generally for this latter work.

Large quantities of horse-manure are used both for fertilising purposes and also for hot-beds. Cloches are employed on a vast scale

THE KITCHEN GARDEN

By J. DUNN, Foreman, Royal Gardens, Windsor

CELERY.—The latest batch of Celery should be planted by now, and that for the autumn supply ready for earthing-up. The season has been favourable, and very little watering has been necessary. But before earthing the plants carefully examine the soil, and if it is at all dry apply a good soaking of clear, soft water, and leave the bed for at least twenty-four hours before the work of applying the soil to the stems is commenced. Trim and tie the plants carefully, removing all side-growths and small, deformed leaves. When the soil has been thoroughly broken it should be carefully placed round the plants with the hand, but never in sufficient quantities to choke the centre growth.

CUCUMBERS. Plants from which supplies are being cut should be frequently top-dressed with small quantities of light, rich soil, in order to promote healthy root action, failing which the plants would soon become infested with red spider and other pests. Keep the growths thinned and tied regularly. Stop young shoots at the first or second joint beyond the fruit, according to the space available, and only allow sufficient fire heat to promote a buoyant atmosphere during the night. Sprinkle the foliage twice daily when the weather is favourable, and close the structure before the day is too far advanced.

TOMATOES. Plants which are producing ripe fruits must be given a top dressing of rich loam and bone dust, and when necessary be given water, let this be afforded in sufficient quantity to reach the extremities of the roots, but the soil must never be allowed to become sour and stagnant through applying water when it is not necessary. Keep the plants moderately free from side-shoots, but at this stage some growth should be allowed to remain, in order to promote root action, and as a means of keeping the fruits from splitting. Ventilate the house freely during favourable weather, and gather the fruits before they are over-ripe. Successional plants should be given plenty of air to keep them stocky. Any structure without fire heat will answer this purpose well. At this stage these plants should be confined to single stems and fully exposed to the light. A sowing should be made at once for raising plants to fruit in winter. Earlier raised seedlings should be potted into small pots as soon as they are large enough and kept quite close to the roof glass in a cool pit or house.

FRENCH BEANS.—A sowing of French Beans should be made at once on a warm south border where protection from early frosts can be easily afforded. If cold pits are available, a sowing should take place every ten days until the end of August. After that date pits with some fire-heat should be used for the purpose. When the plants are well through the surface they must be given plenty of moisture at the roots, and the lights may be allowed to remain off the pit until the nights become cold.

CARROTS.—Give special attention to the thinning of late-sown Carrots, and dust them frequently with soot. This crop will benefit by the free use of the Dutch hoe between the rows after the plants have been thinned. All Carrots which are not sufficiently advanced for thinning must be encouraged to make quick growth during the autumn.

CHICORY.—The latest batch of Chicory plants should now be ready for thinning, and this work should be accomplished before the seedlings become drawn. Allow 3 inches between the plants in the row and hoe the surface soil frequently during the autumn.

TURNIPS.—Another sowing of some hardy Turnip should be made at once to stand through the winter in the open ground. Thin them as soon as the seedlings are large enough, or these late plants will soon "draw," and dust them with wood ashes in damp weather.

W. THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVEY, Abbots Wood, Godalming, Surrey.

STRAWBERRY BEDS.—Plants that are already three years old may now be uprooted and destroyed, though we are still gathering a few fruits of "Givon's Late," a variety which seems to enjoy this light soil. It will be well to have a special plot for late fruiting varieties on one side or the other, so that these will not be in the way when the others are ready to be destroyed. I find the best method in dealing with old Strawberry ground is to cut the plants off a few inches under the ground with a sharp spade or mattock. It is certainly expeditious, and all the ground needs then is to have the weeds cleared away; and the Brassica section will be found to do well in such a quarter, as these like firm ground. In some heavy soils one cannot quickly prepare a plot like this. The plants have to be dug up with a fork. Clear other Strawberry beds, cut away all runners not required, and apply water when necessary. Perpetual fruiting varieties of the St. Joseph and Alpine classes should be freely supplied with liquid manure. The fruit will prove an agreeable addition to the dessert.

ESPALIER TRAINED APPLE TREES.—These should now be finally summer-pruned if it is not already done. Tie in the leading supports to the wire, and if the trees are growing on the edge of vegetable quarters they may need extra nourishment. The fruits on these trees on the upper side of the branches usually develop very high colour, being more exposed, but are easily protected from the birds in dry weather. Early varieties do well in this particular style, as does Cox's Orange Pippin. Early varieties will require netting almost at once.

BLACK CURRANTS.—When the fruit has been all gathered, any thinning of shoots that is necessary can be carried out, and any branches that have become damaged. The shoots may be thinned severely in order to keep the bushes in a good cropping condition. Young growths from the base produce the best fruits. Boskoop Giant is a rare grower, and produces fruit of the highest excellence. Lee's Prolific should be made a note of, as this is one of the best-flavoured varieties.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gattin Park, Reigate.

ONCIDIUM.—*Oncidium crispum*, *O. Forbesii*, *O. Gardneri*, and *O. Marshallianum* should be repotted when the young growths are from 2 to 5 inches long, and are just developing new roots. The flowers of these species are produced on pendulous racemes, and for that reason it is preferable to grow the plants in shallow Orchid pans without side-holes. The compost should consist of equal parts of Osunda or A.I. Fibre (cut into rather short portions), half-decayed Oak leaves, and chopped Sphagnum moss, with a suitable quantity of crushed crocks, the whole well mixed together. Place a few crocks in the bottom of the pan for drainage purposes, pot rather firmly, and leave space for a surface of Sphagnum-moss. Suspend the plants from the roof rafters of the intermediate house, or in the warmest position in the Odontoglossum house. Water should be applied sparingly until the roots have grown freely in the compost, when the amount may be slightly increased, but the soil should at no time become saturated with moisture. The warmer *Oncidium*s, such as *O. Lanceanum*, *O. luridum*, *O. Carthagenense*, may also be given fresh rooting material as they reach the proper condition. Use a compost of Osunda fibre and Sphagnum moss cut into short portions, with a liberal addition of crushed crocks. Ordinary, well-drained flower-pots are the most suitable receptacles. In repotting, arrange the compost in conical shape, well above the rim of the pot. Stand the plants near the roof-glass in the warmest house. When the roots are growing actively they should be supplied with plenty of water, and the plants sprayed frequently during bright days. During the resting

season water should be applied sparingly, but at no time should the compost be allowed to become quite dry, as the plants do not possess pseudo-bulbs. *Oncidium ampliatum* may be given fresh rooting material whenever new roots appear at the base of the young growth. This plant grows best in shallow teakwood baskets provided with plenty of drainage materials but only a thin layer of compost. The plants should be suspended from the roof rafters in a light position in the warmest house. *Oncidium macranthum* is developing its flower-spikes, and should be supplied liberally with water at the roots until the flowers are expanded. The inflorescences should be removed soon after the flowers are fully developed, as they exhaust the energies of the plant. After *Oncidium leucichilum* has passed its flowering stage it should be placed in the coolest part of the intermediate house, and be allowed very little water at the roots. Frequent overhead sprayings, however, are beneficial, as they cause the pseudo-bulbs to become plump again after the plant has blossomed. Repotting should be done soon after the new growths have started. Use a compost similar to that recommended for the other species. Place a few crocks in the bottom of the receptacle, and pot the plants in a similar manner to ordinary greenhouse plants.

FRUITS UNDER GLASS.

By JAS. HUDSON, Head Gardener at Gunnersbury House, Acton, W.

PERMANENT TREES IN UNHEATED ORCHARD HOUSES.—The season, thus far, has suited the trees in this structure perfectly. In all probability, some trees will still need to be thinned of some fruits in order to get proper size. Late Plums should be thinned without delay, using a pair of vine scissors, to remove the smaller fruits and any that are deformed, and leaving the crop as evenly distributed over the tree as possible. Some of these thinned Plums, if already fleshy, may be used for tarts or for stewing. Apprets will now be ripening, and where the fruits have a tendency to split see that no excess of water is allowed at the roots. Keep any growing tendency in young wood in check by pinching out the tips of the shoots. Peaches and Nectarines in the unheated orchard-house often give the best and finest fruits, if not overcropped. Look to these also, and remove any misplaced or mal-formed fruits. Water liberally all Plums, Peaches, and Nectarines, and use weak liquid manure with discretion in cases where the crop is heavy. If the wood growth be at all vigorous, it should be checked by pinching the points out of the shoots, unless such be required for extension. Do not let Figs in these houses make too much leaf growth, but keep the shoots pinched so that late fruits now showing may be able to develop. Keep the house well ventilated at all times, more particularly so in bright, sunny weather. Keep a constant eye on insect pests, of which red spider is generally the most troublesome. As a remedy nothing is better than the bag of soot placed in the water tank, as previously advised; it should never be disturbed when once immersed.

VINES IN POTS FOR NEXT SEASON'S FRUITING.—During August and September these trees should be ripening their growth. It is a slow process, and it is desirable to prevent the formation of sappy growth. Rather burn the roots to more air and a gradual lessening of water at the roots. If this cannot be done where they now are, remove them to a light airy house, and later on place them outside in full exposure. Do not be misled into thinking that the biggest and the brownest looking rods are always the best. The buds should be plump and the wood short jointed. Any lateral growth that may still be soft and sappy should be shortened gradually. Young stock struck this year may be grown on still for a few weeks to come if the growth is not all that one would desire.

YOUNG FIGS IN POTS.—Growers who have recently taken up the cultivation of the Fig in pots, and who have struck a fresh stock this past spring, have had a good season for securing

a satisfactory growth. The plants will, in many instances, be showing a few fruits that will prove useful during the autumn. Where such is the case, keep the tips pinched so as to assist the fruits. Also pinch once more others that are not fruiting so as to regulate the growth. Young trees, such as these, may be kept growing through August so as to obtain as good a plant as possible for next season. The system of striking a few plants every spring is to be recommended in many ways; it gives one the opportunity of casting aside an unwhitely plant if needs be, and it is a means of gradually increasing the stock of a most excellent fruit, and of affording an addition to the varieties grown in pots.

THE FLOWER GARDEN.

By W. J. GURSE, Gardener to Mrs. DEMMESTER, Keele Hall, Staffordshire

CARNATIONS.—Carnations should be layered during the next few weeks; in the meantime, prepare a light, sandy compost, or peat leaf-mould and sand in equal proportions through a fine sieve to form a rooting medium. Fork the soil lightly between the rows and place a liberal quantity of the compost around the base of each plant, and select the strongest growths for layering, and prepare them by cutting off a few of the lower leaves, and cutting through the stem in an upward direction between the third and fourth joint from the top of the layer. Press the layer into the compost with the "tongue" well open. Secure the layers in the soil with pegs made from Braeken Fern, cut a few hours before required and placed in water to prevent them shrivelling. In dry weather water the layers through a fine rose and keep the compost moist. The stems should root in six weeks from layering.

PINKS.—Young shoots of Pinks detached from the plants will root readily in shallow frames or under bell-glasses. The pipings may have the lower leaves removed, and the stem cut through below a joint, or they can be inserted with a heel. Diddle the pipings firmly in a sandy compost, 2 inches apart. Spray the cuttings through a fine rose to settle the soil, and allow the foliage to dry before closing the frame. Shade the frame during bright sunshine and give an gradually directly the plants are rooted. Propagation may also be done by division of the old clumps, retaining a few roots to each portion.

TRANSPLANTING WALLFLOWERS.—Seedling Wallflowers and other spring-flowering plants sown become drawn and weakly if allowed to remain too long in the seed beds. Plant them in an open situation, and make the soil firm. Allow a space of 2 inches between the plants and 12 inches between the rows. Pansies, Violas, and Polyanthuses need a partially shaded position. Spray the plants every evening for the first week or ten days after planting.

ANTIRRHINUM.—Seeds may be sown now to produce a few plants for early flowering next year. Sow thinly in drills 12 inches apart, and transplant the seedlings into an open border directly they are fit to handle. Plants from this sowing will not give the lengthened display of flowers as those sown early in the New Year.

HERBACEOUS PHLOX.—Give the plants sufficient clear water to wet the roots thoroughly, and apply a mulching of decayed manure. Stimulants should be given in some form with occasional doses of root water. Place a strong, neat stake to each plant, and tie in the growths with some soft material.

AUTUMN-FLOWERING GLADIOLI.—Manure water, root water, or an approved fertilizer, are all excellent stimulants for Gladioli, if not used in excess. Light top-dressings of some rich material applied at the present time will be beneficial. During dry weather clear water should be given frequently. Stir the surface soil occasionally with a small hoe or hand fork.

BUDDING ROSES.—For the budding of Roses, select plump buds from shoots that have flowered. Cut them out cleanly with about half an inch of wood to form the shield. The wood

from the back of the bud must be very carefully removed with a sharp knife. Where standards are to be dealt with, insert the bud within one or two inches of the main stock, and for dwarfs as near to the roots as possible. Make the incision in the bark 2 in. long in length, insert the bud, and bind it firmly with raffia. Several buds may be inserted on one stock, but the weaker ones should be removed at a later period. It may be necessary to slacken the raffia a little after about six weeks.

PRUNING HEDGES.—Hedges of Holly, Yew, Privet, Thorn, Hornbeam, Laurel, and Beech may receive the final trimming for the season. If the work is done at once they will make just sufficient growth to obliterate the stiff appearance of the trimming. Shears should be employed on Thorn, Hornbeam, Beech, and Privet hedges, but for Laurel, Rhododendron, and Camfers the knife or standard tree pruner is the best tool to use.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTCOTE, Eastwell Park, Kent.

ACHIMENSES.—These will now be coming into flower. Feed the plants regularly with a good plant food. Use a few small twigs or Bamboo tips to keep the plants from straggling. When in bloom, Achimenses should be removed to a cooler and drier atmosphere, and when injured to the new conditions, additional ventilation should be given. When fully grown, they must not be allowed to become dry, or the blooms will fall off. Achimenses are excellent basket plants for the conservatory. When potting them in the spring the combs are put in at regular distances through the mossed surface of the basket.

COLEUS THYRSOIDEUS.—Young plants of *Coleus thyrsoideus* in 3-inch and 5-inch pots should be transferred to their flowering pots without delay. The soil should consist of three parts turfy loam to one of leaf soil and sand. If a number of plants is grown in various sized pots, it must be remembered that those in small pots will require more water and earlier stimulants than those in large pots. When the plants are fully re-established, increase the amount of air and allow plenty of space between the plants.

ACALYPHA HISPIDA (SANDERIANA).—If young plants of *Acalypha hispida* were propagated in the spring, they will now be growing rapidly. They do well in 5 or 6 inch pots, but good specimens grown on into 7 or 8 inch pots are effective. When large plants are required, the blooms should be pinched off as soon as seen, and the plants stopped when about 3 feet high. They will then break into several growths, and the blooms depend from the head of the plant. If grown on without a check, the plants will soon reach a height of 4 or 5 feet. They should occupy a light position in the stove, and not be shaded too much. When established in their flowering pots, careful feeding must be the rule, and they must never be allowed to suffer from drought. When the blooms have developed, the plants should be kept in a somewhat drier atmosphere. Keep a sharp look out for red spider and thrips. Other *Acalyphas* which are well worth growing are *A. musaica*, *A. macrophylla*, and *A. Gussoneana*.

LILIUM.—As the plants come into bloom they should be placed in a cool, well-ventilated and shaded greenhouse or conservatory, in which the bloom will last a good time. Stake all late batches of plants, and give a final top-dressing. A number plunged in ashes under a north wall will prolong the season, and be useful in the autumn.

ZONAL PELARGONIUMS.—Where these are required for blooming in autumn and winter, they should now be stood outside in a sunny position, where they will build up firm and short-jointed growth. Keep the plants pinched out of the straggled plants to ensure a bushy habit. Pinch out all flower-spikes as soon as seen. Turn the plants occasionally, so that they do not get rooted through the bottom. Feed very moderately as soon as the pots are well filled with roots.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would advance delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the Editors. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intimation of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturalists.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 62.0.

ACTUAL TEMPERATURE.—Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Thurs. day*, August 2, 10 a.m., Bar, 29.1 (imp), 62.2, Weather—Dull, with rain.

The Garden Cultivation of Poor Grass Land.

The following observations bearing on the fertility of surface soil may be of interest to those who are engaged in bringing poor grass land and uncultivated land generally under garden cultivation. A field consisting mostly of Couch grass (*Trisetum repens*) was ploughed just before the great frost of last year. The turned-up sods froze into solid lumps, but when the thaw came the Couch grass was found to be undamaged. An acre strip of the field was marked out for sundry crops, including Parsnip, Beet, and Haricot Beans, and in order to prepare the land for these crops it was bastard trenched. This work was done by a group of gardeners, whose opinion differed as to the best method of procedure. Some members of the group insisted that it would be best to turn in the sods grass-side downwards; others thought that, although the labour would be greater, it would pay to first shake out the sods, and only turn in the grass after the soil about its roots had been shaken out. Accordingly, the strip, about an acre in extent, was treated, one half by the former method, the other by the latter method. The essential difference in these methods lay in this, that whereas, by shaking out, the surface soil was kept on the top, by turning in the sod it was buried.

The difference in growth of the crops on the two halves is now manifest, and very instructive. The better growth of all the crops on the shaken out half is so striking as to divide the plot into two evident halves. The superiority of the shaken out half is to be attributed to two causes. In the first place, the Couch has grown more and has given more trouble where it was simply turned in. That was to be expected; but it by no

means wholly accounts for the better growth of the shaken-out strip.

That this is so is evident from the fact that the difference was apparent from the moment that the vegetable seeds germinated and before the Couch had made any growth worth speaking of. It is apparently to be attributed to the fact that such fertility as the soil possessed was confined to the thin upper layer, and that this soil, left on the top, made a good seed-bed, whereas the soil from a few inches deeper, brought up by inverting the turves, was deficient in fertility. If this be so, it would seem that when poor grass land is to be brought under garden cultivation it is worth while first to plough (and plough early), and then to shake out the sods, to leave the grass in position, and to bastard-trench lightly and as late as possible, taking care to leave the surface soil on the top. It should be added that the crops on the shaken-out half of the strip promise to be quite good, and those on the turned-in side fairly good. Incidentally, it may be remarked that the promise of the Dutch Haricots does not appear to justify the assertion made by a correspondent in our pages that this crop only succeeds once in five years. We know that this crop was very successful last year at Wisley, and it promises distinct success this year. Why, if dwarf French Beans can be grown here the dwarf brown Haricot cannot, is by no means clear, and experience, so far as it goes, indicates that it can.

THE "GARDENERS' CHRONICLE": ALTERATION IN PRICE.—Owing to the increased cost of paper and printing, the subscription to the *Gardeners' Chronicle*, after the present issue, will be increased by one penny.

BOTTLES FOR PRESERVING FRUIT AND VEGETABLES.—The orders for glass jars for preserving fruit and vegetables already received by the Food Production Department are so numerous, and the output in the present difficult war conditions, is so much below the manufacturers' estimates, that the Food Production Department has announced that it is unable to accept further orders. Those who wish to obtain bottles should place their orders immediately with their local tradesmen, and the Department will do all in its power to obtain the necessary facilities for the manufacture of supplies to meet these orders. In accordance with an arrangement arrived at between the Food Production Department and representatives of the retail trade, the price to purchasers of 2 lb. jars obtained through ordinary trade channels should not exceed 6s. 6d. per dozen.

CROPS IN 1917.—A note sent out by the International Institute of Agriculture (June, 1917) records that the crop prospects in France, Great Britain and Italy show marked improvement upon their condition in the earlier part of the year; but that in Northern and Central Europe the drawbacks resulting from the severe winter are still seriously felt.

SWEET CHESTNUT CANKER.—A valuable paper* on the fungous parasite which causes canker in the Chestnut diagnoses it as *Endothia parasitica*. The discovery of this fungus in Japan and China affords evidence that the disease which it induces had its original home in those countries. The fungus is now widely distributed in the Eastern United

States from Maine to North Carolina, and is spreading rapidly south and west. This parasite has already destroyed most of the Chestnut trees within a radius of 100 miles of New York City. *Endothia parasitica* attacks not only species of *Castanea*, but also species of *Acer*, *Quercus* and *Rhus*, but so far any serious damage done by it has been confined to the Chestnut.

HOLDENBY GARDENS IN THE SEVENTEENTH CENTURY.—In a recent number of *Notes and Queries* an interesting account is given of a journey taken through some of the Northern and Midland Counties by Charles I. shortly before his death. The following description of the gardens of Holdenby (Holmby) House, Northamptonshire, is quoted in the article, but is, in fact, taken from a Parliamentary survey made three years after the Royal visit:—

"On the south side of the said Mansion House is a pleasant, spacious, and faire Garden, adorned with severall long Walkes, Mounts, Arbors, and seats, with curious delightful Knotts, and in which Garden are many fruite trees of divers kinds; on the south of the said Garden is a large Orchard, well planted, commonly called the Lower Orchard, set artificially in Walkes with severall Ascents, and in the said Orchard are Six fish-ponds, well stored; on the west of the aforesaid Garden, lyeth another Orchard, commonly called the Upper Orchard, planted with severall fruite trees, and in it a long shady Walke; on the north side of the said Orchard is a large Bowling Alley, and on the north and west of the said Bowling Alley are two Walkes artificially set with well grown trees, and in the north west corner of the said Walkes there is a pleasant Mount; on the west side of the aforesaid Garden and Upper Orchard, are two Spynneys, well set and grown with Ashes, and in them a variety of delightful Walkes; and on the east side of the said Spynneys, is a faire Water House, with a very large Cisterne, into which water is conveyed by severall leaden Pippis, from Sundry Heades, which serves the whole House and all the Offices therunto belonging."

VEGETATION OF KOWEIT—No. 6 of the sixth volume of the *Records of the Botanical Survey of India* is devoted to an account of *Some Plants of the Zor Hills, Koweit*, by HUMEFRY G. C. CARTER, economic botanist. The plants were collected some ten years ago by Sir PERCY COX, and identified later by Major A. T. GAGE. An annotated enumeration is now published. Koweit, or Koweit, is situated at the top of the north west coast of the Persian Gulf. We have heard something lately of the climate of Mesopotamia, where the shade temperature sometimes rises above 120° Fahr and falls as low as 14° Fahr, in winter. It is not claimed that Sir Percy's collection is fully representative of this hot region, but it is sufficient to show that the vegetation is xerophilous and scanty in character. Just 101 species of flowering plants are enumerated, and these include a Poplar, a Willow, five species of *Acacia*, and three of *Tamarind*, which, with a few low bushes, constitute the woody element of the vegetation, so far as it is illustrated by the collection. Most of the herbaceous and half-woody plants are grazed, and of *Helianthemum Lippii* it is stated that all kinds of animals feed on it. An undetermined grass, probably a species of *Avistida*, is collected in large quantities and sold as hay. A species of *Matricaria* is common everywhere, growing no more than six inches high. It is used for seasoning and eaten alone. Its principal use, however, is in the manufacture of the curious brick cheese of the Bedouins. This product is a provision for the hot weather, and is used both dry and moistened with water and pounded with dates. Several kinds of fungus are sold in the bazaars, but specimens of these were not forthcoming for identification. Sir Percy Cox, it may be added, is highly engulised for his services by Sir STANLEY MAYNE in his recently published report on the campaign in Mesopotamia.

* Bull. 389, U.S. Dept. of Agriculture. By C. I. Shee, N. E. Stevens, and E. J. Tiller.

ON INCREASED FOOD PRODUCTION.

FEEDING A NATION.

PROFESSOR D. NOEL PATON, Professor of Physiology, University of Glasgow, in a recent address on "Public Health Problems Under War and After-war Conditions," stated that the feeding of a nation should depend upon a knowledge of the dietary requirements of the population as determined by scientific observation and experiment, and that any attempt to regulate the food supply which is not directly based upon such knowledge is more likely to do harm than good. The fundamental fact is that food is the sole source of energy—the power of doing work. The food requirements of the nation is the sum of the food requirements of the constituent individuals, which varies with their ages, sex, and occupation. The energy expended by a man while at rest and while doing different amounts of work has been accurately measured, and these measurements have been checked by the examination of the diets of men under different conditions. The general result arrived at is that a man doing moderate work should take food yielding at least 5,400 energy units (calories) per day. The requirements of women and of children of different ages are estimated as definite fractions of these of a man doing moderate work. By applying the above data to the census returns for 1911, it is found that the whole population was equivalent to nearly 55 million "men," and it is thus evident that the nation required a minimum supply of 454 million million calories of energy in the food consumed in the year. This energy is yielded by the three great constituents of the food, the proteins, fats, and carbohydrates, and experience has shown that in European countries these are taken in something like the proportions: Proteins, 100 grammes; fats, 100 grammes; and carbohydrates, 500 grammes per man per day. A study of the food supply of the nation shows that in pre-war time a considerable excess was consumed. The figures are: Proteins, 117 grammes; fats, 150 grammes; carbohydrates, 571 grammes; calories, 1,000. An investigation of the diets of the labouring classes shows that the food supply was unequally distributed, and that these classes were getting on an average a little over 7,000 calories per "man" per day, indicating that waste among the more well-to-do classes must have been excessive. The foodstuffs from which these energy-yielding constituents were derived are cereals, which yielded nearly 55 per cent. of the energy; meat, about 17 per cent.; dairy produce. The prime importance of cereals, whether eaten directly by human beings as breadstuffs, or indirectly after being converted by livestock into meat and milk, is thus demonstrated. The unfortunate fact that 80 per cent. of Wheat, far and away the most important of these cereals, is imported has to be recognised. The requirements of the nation have been modified by the increase in the military and naval establishments, and by the increased call for work from the civil population. Evidence has been adduced that up to the end of 1916 the food supply remained not less than in pre-war time, and this being the case, it is found that, after making the necessary deductions for the fighting forces, an adequate allowance was still available for the civil population as a whole. But the increase in prices has somewhat accentuated the inequality of distribution. Dietary studies of the labouring classes show that, while generally the increase of income has kept pace with the increased cost of living, those whose incomes have not increased have suffered hardship. The part which the State should play in feeding a nation in war time is, first, to secure an adequate supply of food; second, to secure an equitable distribution of the supply. The prime importance of the supply of bread-

stuffs as human food dominates the situation. This supply may be maintained or increased (1) by increased importation, (2) by better milling, (3) by limiting their use as cattle food, (4) by limiting their use in brewing and distilling. Increased production at home is a policy of the future. To secure equitable distribution, various courses, separately or combined, are possible: (1) To raise wages proportionately to the rise in the price of food; (2) while doing this, in the case of the organised trades, at the same time to make provision for those whose wages are not increased by supplying bread to them at a lower price; (3) to limit the rise of prices by fixing maximum prices; (4) to limit price by decreasing con-

sumption. A consideration of these seems to point to the conclusion that the best course is to allow the natural rise of prices by which supply is stimulated and waste checked, but to make provision for the supply of breadstuffs, and possibly of other foods, at a price proportionate to their income to those whose wages have not risen proportionately to the rise in prices.

leaf, and by the poorness of its root fibre, I should think that the Carrot required plenty of water, and that perhaps I have failed in the past by neglecting to satisfy its requirements in this respect. Perhaps, however, it is flourishing because the fly has for once left it alone, J. N.

POTATO DISEASE OUTBREAKS: URGENT ADVICE.

The weather generally has been favourable to the Potato crops in most parts of England, but serious outbreaks of disease are reported from Barnstaple, in Devon, and Devizes, in Wilts. Isolated cases are also reported from Somerset, Dorset, and Cornwall. It is important that measures should be taken at once to ring fence

FIG. 11. BRUNUS PSEUDO-CERASUS, LINDL. (From the "Vegetation of Cambridge" Botany, G. S. Gardner, showing the venation and outline and serration of leaf. (See p. 45).)

such outbreak by promptly spraying crops in the surrounding districts. All crops that have not yet been sprayed should be sprayed; all crops that have been sprayed once should be sprayed again within about three weeks of the first spraying. This course is dictated alike by enlightened self interest and by patriotic feeling. The first outbreak reported this year in Pembroke-shire was checked by instant attention to the crops in adjoining districts. Cases in Somerset and Dorset are being dealt with on the same lines. Should a period of damp, warm weather set in, no doubt outbreaks will occur in other counties. There is a fairly liberal supply of hose drawn, knapsack, or hand-sprayers of one kind or another in most districts, and there is no shortage in the supply of chemicals.

A GOOD CARROT YEAR.

HAVING, hitherto consistently and conscientiously failed to grow Carrots in the light soil of my garden, and having this year met with remarkable success, I write to inquire whether this is a general experience, and if so, to what conditions it may be attributed. By the look of its

such outbreak by promptly spraying crops in the surrounding districts. All crops that have not yet been sprayed should be sprayed; all crops that have been sprayed once should be sprayed again within about three weeks of the first spraying. HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

HYBRID PRIMULA SEED.—In reply to numerous inquiries, I beg to say that the Primula seed will not be ripe for another month or so, but will be sent as soon as ready. *Herbert Morrell, Monmouth.*

THE HOUSE SPARROW.—As the house sparrow is becoming so useful in certain districts, would it be possible to send a few of the marauders to be educated? I am sure there are many farmers and gardeners that would rather see the sparrows educated in usefulness than allowed to go their way of destructiveness. Perhaps Mr. Divers and others would kindly take

insects. This season a bed of Onions was badly affected with fly. After taking out all infested plants, as I thought, something knew better, and pulled up others, even digging small holes in the soil. Every Onion pulled in this way was infested, but not a maggot could be found. I am giving the credit to the sparrows, though I did not actually see them at work. But the house-sparrow does eat the buds of Gooseberries and Currants, the growths of young Lettuces, Peas, and later he takes the Peas from the pods, all of which can be prevented with black cotton netting. *Southern Grower* complains of devastation by caterpillars, also that no sparrow eggs have been brought to him, although he offered to pay for them. If he thinks those two things out, he will probably grow a few more sparrows on his

pruning Loganberries and other fruits of a similar nature. I cannot understand why these plants should be pruned just as their fruits are developing, and should think there must be some mistake in the matter. What is the object of pruning at the end of July? *Enquirer.*

—It is usual to prune all side growths and badly placed shoots and all unnecessary wood when tying in at this season, which has the effect of exposing the fruits. There was no slip of the pen. Autumn pruning is of quite a different character. If the plants are well cared for now, it will be much easier to gather the fruits, and less pruning will be needed in winter. Moreover, more vigorous growth will be made by those shoots which are retained for fruiting next season. *W. J. Cook.*

SUMMER PRUNING.—I should like to acknowledge the assistance which I, an amateur, derive from the advice given by your experts in the "Week's Work" column, and I venture at the same time to ask for a little more. When I am directed to pinch or prune spur shoots to four or five leaves, should I count the two or three leaves which often arise very close together at the base of the current year's growth? I believe that the advice to prune to four or five leaves in July is based on the fact that if this is done only one or two axillary buds—and those towards the ends of the pruned shoots—are likely to break, and that in winter pruning these sub-laterals may be removed. If I count the two or three basal leaves the spur which is left will be so short as to make subsequent winter pruning difficult. *Enquirer.*

SUPPORTING THE SHOULDERS OF GRAPE.

Whilst paying all due reverence to Mr. Hindson (see p. 255, Vol. LXI), I may say I have used Grape props similar to that illustrated in fig. 20 for 35 years, and the improvement they encourage in bunch and berry is beyond dis-

FIG. 20.—SIMPLE PROP FOR GRAPE.

pute. If anyone could make these props of various sizes, and sell them cheaply, it would be a great boon to many gardeners. I use Ash wood, but red deal sometimes will do. *North Devon.*

SOCIETIES.**ROYAL HORTICULTURAL.**

JULY 31.—Owing, no doubt, to the near approach of the holiday season, and also as a consequence of the sudden change from tropical conditions to wet and cool weather, there was not a great display at the Drill Hall, Westminster, on the above date, nor was the attendance large on this occasion, although the Dry-bulb Show brought many traders to town.

The Floral Committee recommended one First-class Certificate, three Awards of Merit, and awarded ten Medals.

Gladioli from Messrs. KELWAY and SON nearly filled one length of tabling; there were about a hundred vases, and each vase contained three flower-spikes. At one end was grouped the *G. primulinus* hybrids, in various shades of yellow, tawny, and apricot; Wraith, Friendship, Ella Kelway, Mrs. Swainson, Golden Girl, and Mrs. Cran (tinged with pink), were a few of these charming long-stem varieties. Among larger-flowered sorts, Painted Lady, Rose of July (very rich rose and scarlet), Ormonde, and Kelway's Superb, attracted special attention. Messrs. H. J. JONES were represented by Phloxes set up in fourteen very large and bold stands, each containing one variety: Mrs. Alder, delicate pink, with a mauve-purple eye, was a new variety of outstanding merit and distinction; Widar, purplish-blue with white eye; Mrs. H. J. Jones, rose-pink, and Elizabeth Campbell, were all finely shown.

The elegant *Thalictrum ditiocarpum* was grouped very pleasingly with *Astilbes* and double *Gypsophila* by Mr. J. C. ALLGROVE, who also staged the exquisite little *Astilbe simplicifolia*, with its bronze tinted leaves and plumes of white

FIG. 19. PINUS PSEUDO-CERASUS, LINDL. TYPE-SPECIMEN IN THE CAMBRIDGE HERBARIUM. (Leaf specimen, 11/4 inches long.) (See p. 47.)

the matter in hand and form a sparrow aviary for education. *C. H. H. H.*

—As everyone seems to think Mr. Stannary is confusing the two sparrows, let me say that in speaking of the sparrow I mean the common house-sparrow, with its insouciance, and not the hedge-sparrow with its pretty and shy movements. From personal observation, I know that the sparrow will clear Roses of green fly, and I have seen them eating Plum aphid, hanging upside down like a tit. This past week, on a new plot of Potatoes, the tops could be seen moving, with an occasional glimpse of a sparrow. Clap your hands, and a dozen or more would fly out to the nearest fence, and some of them had beakfuls of the Potato Fly. I have seen them digging out the Rose maggot, also leaf-rolling caterpillars on fruit trees, and peering into trusses of bloom for other

caterpillars, and if the sparrows become too numerous, a charge of hot shot will provide him with a delicious pie, thus making "all ends meet." *C. E. Bridgell, 62, Munster Road, Tredington.*

BOTTLING ONIONS. In connection with the trial of Onions at Wisley, I understand that the plants sown in autumn showed early in the year a remarkable tendency to break into flower, but that this tendency was checked by the removal of the flower-heads as soon as they were visible. This simple method is new to me, and I refer to it because it may not be known so widely as it should be. *F. K. H. S.*

PRUNING LOGANBERRIES.—In the *Gardeners' Chronicle* for July 21, under the heading "The Hardy Fruit Garden," your contributor, Mr. Cook, refers to the present time as suitable for

flowers; and *Anemoneopsis macrophylla*. Messrs. JAS. VEITCH AND SONS' exhibit of stately double Hollyhocks proved very interesting; the spikes were finely developed, and the blooms large and round enough to please the most exacting of old florists. *Britannica*, crimson-scarlet; *Walden Yellow*; *Lady Bailey*, pink; *Exultum*, dark crimson; and *White Queen*, a new pure white, were commendable varieties. *Mary Allwood* was the most striking Carnation in a goodly group from Messrs. ALLWOOD BROS. *Azalea arborea*, shown by Messrs. J. CHEAL AND SONS, is a good late sort, with white, very fragrant, flowers; and *Robinia Kelseyi* bearing its pretty crimson haired pods, were noted in this firm's display. *Campanula Mariesii* was well shown by Messrs. J. PIPER AND SONS, and Mr. L. R. RUSSELL showed sprays of the finer Oaks and some golden Conifers.

Mr. H. J. ELWES, Colesbourne Park, brought up a number of interesting flowers, including *Campanula Vidalii*, *Hedychium coccineum*, a fine white *Crinum*, *Disa Luna* (grown out-of-doors since May), and species of *Bonarea*, *Stapelia*, *Poterium* and *Cypripedium*. A brilliant *Antirrhinum* named *Fusilier*, gorgeous in scarlet and gold, came from Messrs. DOBBIE AND Co.; it is of intermediate habit.

The Orchid Committee was not overburdened with work. It granted two Awards of Merit and two Medals.

The Fruit and Vegetable Committee had little to do beyond granting one Medal and a Cultural Commendation.

MESSRS. SPOONER AND SONS' ten dishes of Apples included good samples of *Beauty of Bath* and *Mr. Gladstone*, both early dessert varieties. Mr. ANDERSON, Wellington, New Zealand, received a Cultural Commendation for fine examples of *Sturmer Pippin* Apple.

Floral Committee.

Present: Mr. E. A. Bowles (in the chair), and Messrs. W. J. Bean, S. Morris, John Green, R. C. Notcutt, J. W. Barr, G. Reuthe, John Heal, W. P. Thomson, J. W. Moorman, C. Dixon, Jas. Hudson, Thomas Stevenson, H. J. Jones, J. W. Blakey, Arthur Turner, George Paul, Herbert Cowley, Chas. E. Pearson, C. H. Jenkins, J. F. McLeod, and C. R. Fielder.

FIRST CLASS CERTIFICATE.

Thalictrum dipterocarpum.—Although by no means a new plant, this *Thalictrum* is not a very old inhabitant of our gardens, but it has become familiar to all who have taken an interest in hardy plants during recent years. Its elegant leafage and tall, graceful, branching spikes of blue flowers are exceedingly attractive. The species was introduced to cultivation by Messrs. Jas. Veitch and Sons, through Mr. E. H. Wilson, who collected it in China; an Award of Merit was granted it in 1903. Shown by Mr. J. C. ALLGROVE.

AWARDS OF MERIT.

Gladiolus Sunspot. A charming variety, with large, slightly hooded flowers of a delicate pink shade, overlying cream, the latter colour showing as an irregular margin round the large blotch of rich chestnut-scarlet which occupies the greater part of each of the three lower segments. There were five or six expanded blooms on each spike, and a dozen or so of unopened buds; the strongest spikes had basal branches. Shown by Messrs. J. KELWAY AND SON, Langport.

Anemone vitifolia tomentos.—A fine species from China, sent home in 1909 by Mr. Purdon. It grows from 3 feet to 4 feet high, and its basal leaves are large and handsome. Half way up the stout stems there are usually three large trifoliate leaves, each lobed and serrated like a vine leaf. From this point the stem branches, and carries its flowers in large terminal clusters. The latter are very like those of *Anemone japonica*, pink, rose-coloured out side, and with a central cluster of yellow stamens. The leaves are dark green, tomentose on the under side. Shown by Mr. J. C. ALLGROVE.

Gentiana Purdonii.—This is a showy species, somewhat akin to *G. Przewalskyi*. The principal leaves are broadly linear, and from 4 to 6 inches long, and from just below the tufts of these spring the foot-long spikes. These are evidently intended to depend or lie

along the ground, where their bright blue, white-tubed flowers turn upwards. We counted fourteen flowers on one branching spike. The individual blooms are about an inch across the mouth and 2½ inches long. The mouth has five large lobes, with five alternating small lobes. Shown by Mr. J. C. ALLGROVE.

AWARDS FOR GROUPS.

Silver-gilt Banksian Medal.—To Messrs. JAS. KELWAY AND SON; for *Gladioli*.

Silver Flora Medal.—To Messrs. J. CHEAL AND SONS, for hardy shrubs and Dahlias; and to Messrs. H. J. JONES, for Phloxes.

Silver Banksian Medal.—To Messrs. ALLWOOD BROTHERS, for Carnations; to Messrs. H. B. MAY AND SONS, for Ferns; to Mr. G. REUTHE, for hardy flowers; to Mr. L. R. RUSSELL, for ornamental shrubs; and to Messrs. J. VEITCH AND SONS, for Hollyhocks.

some, large-flowered *Cattleya* of fine shape and colour. Sepals and petals salmon-pink tinged with yellow, the midribs being of a pale gold shade; lip broad, clear chrome yellow in the centre, the well-rounded front being deep magenta-crimson. The *C. Dowiana Rosita* with which, crossed with *C. Harlyana*, Messrs. Armstrong and Brown produced *C. Prince John*, is a fine character-giving feature in the new hybrid. The *C. Eldorado* in *C. indesous* imparts delicate fragrance.

Cattleya Princess Royal (*Fabou* × *Hardyana*), from Messrs. CHARLESWORTH AND Co., Baywards Heath. A richly-coloured flower equal in size to *C. Hardyana*. Sepals and petals deep rose-purple with the white ground colour showing through on the petals between the veining. The lip is rubred with gold lines from the base to the centre and with a thin lilac margin.

FIG. 21. BRUNIA SERRULATA, LINNÆ. TYPE SPECIMEN IN THE CAMBRIDGE HERBARIUM. (Original specimen from the Berlin Herbarium.)

Bronze Flora Medal.—To Mr. J. C. ALLGROVE, for hardy plants.

Bronze Banksian Medal.—To Messrs. J. PIPER AND SONS, for hardy flowers.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), and Sir Harry J. Veitch, Jas. O'Brien (hon. secretary), W. Bolton, S. W. Ploy, Fred K. Sander, Pantia Ball, Thomas Armstrong, Gurney Wilson, J. Wilson Potter, and C. J. Lucas.

AWARDS.

AWARD OF MERIT.

Cattleya Rosita *Orchidhurst variety* *Prince John* × *indesous*, from Messrs. ARMSTRONG AND BROWN, Tunbridge Wells. A very hard

GENERAL EXHIBITS.

MESSRS. ARMSTRONG AND BROWN, Orchid Lists, Tunbridge Wells, were awarded a SILVER FLORA Medal for a group, in which the best novelties were *Cattleya illustris* *Orchidhurst variety* *indesous* × *Aris*, a clear yellow flower with dark rose veining on the front of the lip; and *Odoniada Uta* (*Odin*, *Hallii* × *Oda*, *Charlesworthii*), with cream-white flowers prettily barred and blotched with plum colour. The crest is strongly indicative of *Odin*, *Hallii*, to which the whole flower inclines, to the exclusion of the dark red in *Oda*, *Charlesworthii*. *Albion*, *The Rev. W. Wilks*, with enormous Peach-blossom coloured flower, and a very dark form of *Laelo* *Cattleya* *Promax* (*elegans* × *Geo. Woodhams*), were also shown.

Messrs. CHARLESWORTH AND CO., Haywards Heath, were awarded a Silver Flora Medal for a group in which the Xanthodes forms of *O. crispum*, *O. eximium* and *O. arborescens* were effective, and the late-flowering *Miltona vexillaria rubella*, with many spikes, well shown. A fine novelty was *Laelio-Cattleya Marina* (L.-C. St. Godard x C. Hardyana), with deep rose-coloured flowers having a broad ruby purple lip with gold lines from the base. A good yellow form of L.-C. Appam, with ruby-crimson front to the lip, and L.-C. Agnes (C. Schilleriana x L.-C. callistoglossa), which in form and colour adheres closely to C. Schilleriana, were also noted.

J. ANSALDO, Esq., Rosebank, Mumbles, sent *Sophro-Laelio-Cattleya Corona* Ansaldi's variety (L. C. Rubens x S.-L. C. Dorila). With *Laelia panula* in both the parents its influence has been very strong in this neat hybrid, which in form and colour approaches that species closely, although a shade of orange underlying the surface colour in places shows traces of *Sophronitis*. The sepals and broadly ovate petals are deep rosey mauve, the lip having a ruby-purple front and yellow disc.

Mr. J. E. SHILL, The Dell Gardens, Englefield Green, showed a flower of *Cattleya illustris* var. *Savoyard* (fideusesis x *Avis*), pale canary yellow with light purple front to the lip.

Fruit and Vegetable Committee.

Present: Mr. Owen Thomas (in the chair), Rev. W. Wilks, and Messrs. W. J. Jefferies, John Harrison, E. A. Bunyard, John Basham, H. Markham, E. Harris, Jas. Gibson, J. C. Allgrove, Edwin Beckett, Jas. Vert, W. H. Myers, W. Bates, H. Somers Rivers, and A. W. Deteraf.

Groups.

Silver Banksian Medal.—To Messrs. SPOONER AND SONS, for Apples.

Cultural Commendation.—To Mr. ANDERSON, Wellington, New Zealand, for *Stimmer Pippin* Apples.

DRY BULB SHOW.

There was a good exhibition of dry, home-grown, hardy flower bulbs.

Two sets were staged in the amateurs' class for a collection of not fewer than ten varieties, five to be Daffodils. Here Mr. G. STOKES, Bentley Road, Doncaster, gained 1st prize for a capital collection which included bulbs of *Lilium candidum* and Madame de Graaff Daffodils; Miss V. WARREN, The Oaks, Westbere, Canterbury, was awarded 2nd place.

In the class for twenty varieties of Daffodils, twenty bulbs of each, Messrs. J. R. PEARSON AND SONS, Loddham, won the 1st prize with specimens of large size and weight, those of Empress, Emperor, Vega, Weardale Perfection, and Florence Pearson being especially fine. There were four entrants, and second place fell to Messrs. R. H. BATH, LTD., Wisbech, for a capital lot; Messrs. HUGG AND ROBERTSON, Dublin, were 3rd, and Mr. J. MALLENDER, Strood, Bawtry, 4th.

The premier award for ten market varieties of Daffodils, twenty "single" bulbs of each, was won by Messrs. R. H. BATH, LTD., with clean examples of King Alfred, Sir Watkin, Victoria, Madame de Graaff, Emperor, Empress, Brightness, Ornatus, Weardale Perfection, and Barrii conspicuus; Mr. J. MALLENDER was 2nd.

Competition was especially keen in the class for a collection of home-grown Tulip bulbs, in not more than twenty varieties, nor more than twenty bulbs of any one variety. There were five competitors, and the 1st prize was awarded to Messrs. J. R. PEARSON AND SONS for a set of very large and heavy bulbs which consisted of nineteen Darwins and one budding variety. Some of the bulbs were of immense broader size, notably those of Marconi, Feu Brilliant, Henner, and Moralis. Some discussion took place among the traders present as to the definition of the word "collection," and there seemed to be a pretty general opinion that both early and late varieties should be well represented in such a class, or that in future there should be one class for bulbs of early varieties and one for Darwins. The 2nd prize went to Messrs. GEORGE MONRO, JUNR., The Maltings, Spall-

ing, for a collection which attracted attention by reason of the good size, cleanness, and general smoothness of the set; early single, early double, May flowering and Darwin varieties were all represented, and notable bulbs were those of La Reine, Bartizon, Vuirbaak, Washington, Professor Bauwenhoff, and Murrilo. Messrs. HUGG AND ROBERTSON were 3rd, and Messrs. R. H. BATH, LTD., 4th.

For a collection of any dry, home-grown hardy bulbs (other than Daffodils and Tulips), and not more than thirty varieties, Messrs. BARR AND SONS were 1st prizewinners. In this class diversity of genera and species received favourable consideration from the judges. Messrs. BARR AND SONS set up Eremuri, Fritillarias, Winter Acemites, Hyacinths, Chionodoxas, Anemones, Oxalis, Sparaxis, Cuscutas, Colchicums, Alliums, Irises of sorts, Acillas, Leucojum, Polygonatum, Ornithogalum, Cyclamen and Crocuses. Messrs. HUGG AND ROBERTSON gained the 2nd award.

Obituary.

C. McAINSH.—We regret to record the death of Mr. D. McAINSH, for many years gardener at Leeds Castle, near Maidstone. Mr. McAINSH was a Scotchman, and, though long resident in the South, he retained to the last his native accent, which, coupled with a sense of humour, gave him a distinct personality. The gardens at Leeds Castle were a tribute to his skill, and the fact especially was always worth a visit to inspect. Among his many friends he will be greatly missed.

CROPS AND STOCK ON THE HOME FARM.

MUSTARD FOR WHEAT

No time should be lost in finally ploughing fallow ground intended for Wheat, from which, perhaps, a crop of Swedes was taken, an opportunity having been given since of cleaning the land from Couch grass. After ploughing, harrow over the surface, draw the roller over it to facilitate the sowing of 20 lbs. of Mustard seed per acre with the hand seed harrow. Harrow the ground once afterwards. In six weeks' time the Mustard should be 2 feet high, and ready for ploughing in at the end of September or early in October, sowing the Wheat directly afterwards. Especially is the early sowing of Wheat to be recommended on stiff land, as the plant obtains a firm root hold before wintry weather affects the growth.

RAPE AND TURNIPS FOR WHEAT

The recent showery weather has brought on these crops amazingly, so that the roots will shortly be in a satisfactory condition to be eaten off by sheep, to be followed by a Wheat crop. This is quite one of the best of preparations for Wheat. It is stiff soil the Wheat from such a preceding crop grows with much "strength," a quality appreciated by the miller.

THE HARVESTING OF WHEAT.

It is to be regretted that recent rains have beaten down the grain crops over large areas in many counties, just when they were ripe for cutting. To obtain Wheat of extra "strength," bright red in colour, and full of gluten, the cutting should not be delayed until the Corn is quite ripe. It should be cut when it is, say, three-quarters ripe; indeed, the straw may still have a green hue about it.

Wheat cut at this stage is not so liable to "but"—shake out by handling—as when allowed to become thoroughly ripe before cutting.

ELECTRIFIED SEED OATS.

I have recently inspected two samples of Oats cut from plants raised from electrified seed and from untreated seed of the same variety growing in the same field under the same conditions. Certainly there is a huge difference in the size of the ears, but time alone can prove the value of such treatment. *E. Molyneux.*

CARNATION DISEASE: F. P. Assuming that the disease you mention is the leaf-spot of Carnations caused by the fungus *Uredo dianthi*, a good preventive measure is to spray the plants with potassium sulphide; but whilst this is useful, the best growers prefer to stamp out disease altogether by pinching off every leaf that shows evidence of attack, and as soon as it can be detected. At first the result is to appear to make the plant appear disfigured by the loss of so many leaves, but if the remedy is proceeded in, and the leaves thus removed destroyed by burning, as well as all those plants which are so debilitated by the process as to be incapable of making good specimens, the cultivator will eventually have the mastery, and the disease cease to trouble his plant.

HEDGE AS SCREEN: F. You cannot do better than plant *Cupressus macrocarpa*, *C. Lawsoniana*, *Thuja plicata*, or *Labocedrus decurrens* to form the screen you desire. All of these plants are rapid growers when once established, of strictly columnar habit. They should be planted about 6 feet apart to form a dense screen. We advise you to first see each kind of plant and choose which you like best; the rate of growth, habit, and price are practically the same in each case.

NAMES OF PLANTS: J. C. B. The larger Honey-suckle is *Lonicera periclymenum* Dutch Red; the small leaved one is *Lonicera syriacantha*, from China; the Lily is *Lilium regale* (Wilson's Lily)—*Ernest R. Colburn*. 1. *Sidaea malyaciflora*, or *S. spicata*; most likely the former, but you should have sent a leaf from the base of the plant, and a deeply divided one from near the top; 2. *Chrysanthemum coccineum*, a pale golden variety, generally known as *Pyrethrum*.—*W. H. E.* 1. *Sodium hybridum*; 2. *S. spurium* var. *album*; 3. *S. spurium*; 4. *S. album* var. *brevifolium*; 5. *S. reflexum*; 6. *Linum var. variegatum*; 7. *S. rupestre*.—*W. G. Hails*. *Bignonia radicans* (Peas next week).

NEVERLY ENGAGEMENT: F. J. W. You do not say that your employer sent you away without notice, but merely that he told you to look out for a fresh place, giving certain reasons which, you believe, are incorrect, but the validity of the reasons does not matter in this case, as the employer is under no obligation to give a reason at all, provided there was proper notice to terminate the agreement between you. There are other circumstances which will have to be taken into consideration, and, assuming that you wish to know definitely whether there is a good case against the employer, your best plan would be to consult a local solicitor on the matter.

PEACHES: Enquirer. There is nothing in the Peach leaves themselves to help us to determine the cause of the trouble of which you complain. It is most likely that the failure of the leaves is due to unsuitable conditions at the root; and whether such conditions have been brought about by the use of the miscellaneous manure you obtained from a distance or to insufficient drainage of the border, it is not possible to say without means of examining the border. There is a further possibility that the insecticide you used may have been too strong for the tender foliage of the Peach. If a check was caused to the roots every time you applied a fresh watering, you will have to try and determine whether this was caused by injurious substances from the manure, or to water-logging of the roots through ineffective drainage.

MARKETS.

COVEYNT GARDEN, August 2.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots and their average wholesale prices. Includes items like Aralia Sieboldii, Asparagus plumosus, Aspidistra, Cacti, and Ferns.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their average wholesale prices. Includes items like Artichokes, Beans, Beetroot, Cabbage, Carrots, and Cauliflowers.

are increasing in numbers, and up to this morning there has been abundant supplies of Gypsophila paniculata and the double-flowered variety, Statice sinuata, S. inflata, and S. monna, which are now arriving in good condition...

1. Fruit from Kent for fruit farms in London should be sent in full truck loads to Bricklayers' Arms Station, as this year will be open at any time for delivery to be effected.

2. Fruit from Kent for fruit farms in London should be sent in full truck loads to Bricklayers' Arms Station, as this year will be open at any time for delivery to be effected.

3. In case of the shortage of cartage all salesmen should open their stands by the time the first deliveries of fruit are made by the railway companies and discharge the vans immediately. This is extremely important in the interests of the whole fruit industry.

4. Salesmen should be specially notified that no orders for "first" deliveries into the markets can be accepted this year and that they should therefore make arrangements to accept the produce as and when rendered to them.

5. The requirement of the railway companies that "market" empties shall be sent in bundles of eight should be observed. Every bundle should be labelled with the consignee's name and station.

6. In order to avoid the necessity for restricting the deliveries from the markets on certain days, which is a most objectionable arrangement, all parties concerned should observe the following regulations.

7. During the war, salesmen should avoid sending empties to country stations on the chance of finding a driver who will consign fruit to them.

8. Salesmen should be prepared to accept empties when rendered by the railway companies, and not only at certain hours or on certain days, but in order to relax congestion in the London markets, empties from farm and market areas, and in the case of considerable consignments, from other areas, should, where practicable, be rendered direct to the ground instead of through the London markets.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers and their average wholesale prices. Includes items like Asters, Carnations, Coreopsis, Cornflowers, Daisies, and Gladioli.

Fruit: Average Wholesale Prices.

Table listing various fruits and their average wholesale prices. Includes items like Apples, Grapes, Lemons, Nectarines, and Oranges.

SALE OF SURPLUS STOCK.

We still hold certain small stocks of Garden Stents, Garden Engines and Pumps, also Garden Rollers, Water Carts, Garden Arches and Hand Lights, which we shall be pleased to clear at special prices, subject to being in stock.

Particulars on application, BOULTON & PAUL, Ltd., ROSE LANE WORKS NORTHWICH.

CARRIAGE OF FRUIT AND EMPTIES.

In view of the strain now falling on the railways, the Board of Agriculture will endeavour to impress upon the Board of Agriculture and also upon the necessity of arranging the railway companies to avoid undue delay in the transport of fruit and empties by rail during the continuance of the war by paying attention to the following points, which the companies regard as very important.

- 1. In order to ensure the despatch of fruit, growers should, where required, advise the stationmaster or goods agent on the night of the approximate quantities they wish to send the following day. This may be necessary, owing to shortage of labour, the railway companies frequently have to restrict the total quantity of fruit they accept for conveyance, and growers who do not give notice may find that it is impossible for their fruit to be accepted.
2. The sorting of small lots into delivery vans, and the delivery of small lots, involves delay. Growers should put together their consignments to salesmen in lots of 2 or 4 tons. Delivery will thus be expedited. In many cases a considerable reduction of the rate is obtained by pooling the consignments in this way. The practice of splitting up the day's load into consignments of more or more than 4 tons, which, for the time being, are not in accordance should be selected for the output. This

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage and their average wholesale prices. Includes items like Adiantum, Croton foliage, and Ferns.

A TREASURY OF INFORMATION

is contained in the

HORTICULTURAL DIRECTORY AND YEAR BOOK.

Nowhere else can the gardener obtain, within the small compass of four hundred pages, so much information on the subjects which interest him most. The knowledge which this little work contains is just what is indispensable to the gardener in his daily life. The

CALENDAR OF GARDEN OPERATIONS

takes him through the whole year, reminding him of the manifold small cares which make all the difference between health and ill-health in his plants. It also reminds him of the exhibitions which are to be held and of the most important annual meetings.

Another interesting section, which expands each year, is the list of

SCHOOLS OF HORTICULTURE.

with a brief description attached to the name of each such institution. Those concerned with the education of young gardeners—both men and women—will turn to this section with especial interest, and those who are seeking such education will find it of the greatest assistance in deciding which school to select. There are still for sale a few copies of the current edition.

SEND FOR ONE AT ONCE TO

The LIBRARIAN, 41, Wellington Street, Strand, W.C. 2.

SITUATIONS VACANT.

Four Lines 3s. (Head-line counted as Two),
6d. for each succeeding line.

Gardeners desiring their Advertisements repeated
must give full particulars, otherwise no
notice will be taken of their communications.
Name and address above are insufficient.
Gardeners writing to Advertisers of Vacant
Situations are recommended to send them
copies of testimonials only, retaining the
originals. On no account should they enter
into communication with unknown corre-
spondents who require a fee beforehand.
Advertisers are cautioned against having Letters
addressed to Initials at Post-offices, as all
Letters so addressed are opened by the
Postal Authorities and returned to the
Sender.

PRIVATE.

WANTED, good all-round HEAD GAR-
DENER, meligible, understanding Glasshouses,
Peaches, Melons, Vines, &c., with knowledge of outdoor
work, cottage, slate wages. Also wanted, a SECOND
GARDENER, to assist Head in Glasshouses and out-of-
doors, meligible. Garden cottage provided. State wages.
A. ALD, Esq., Bulford House, Culpeper, Devon.

WANTED, HEAD WORKING GAR-
DENER, 3 men kept; must have good knowledge,
Inssals and Out, Vines, &c.; single preferred.—MRS.
TYNDALE, Madderwort, Chislehurst.

WANTED, HEAD WORKING GAR-
DENER, thoroughly experienced in Inside and
Outside with personal reference from last employer
required; good wages and cottage. State full particu-
lars, age, &c.—MRS. LITCH, Bramblehurst, East Grim-
stead, Sussex.

WANTED, HEAD WORKING GAR-
DENER immediately, man and boy kept, wages
5s., cottage, vegetables free. Apply, C. L. G. MOORE,
Apply, Hall, Alverstoke.

WANTED, WORKING HEAD GAR-
DENER (meligible); two others kept; good out-
rage, vegetables, fuel.—BARRY, Lampsfield, Surrey.

WANTED, Married (Working) HEAD
GARDENER (meligible), wages 20s., good cottage
and garden. Apply, Tidenham House, Chislewort.

WANTED, HEAD GARDENER (WORK-
ING); two Under Gardeners kept.—State wages re-
quired to C. PETHERSTONHAUGH, Kings Worth
House, near Winchester.

WANTED, an experienced WORKING
HEAD GARDENER. Apply, Sandhurst Lodge,
Wellington College, Berks.

WANTED, GARDENER (SINGLE
HANDED), for Stoke Poges neighbourhood; small
Garden, lodge suitable for married man (no family), ex-
perience of electric plant or possess. State full particu-
lars, experience, references. MAJOR DARLEY, Staf-
ford Hotel, St. James's Place, S.W. 1.

WANTED, at once, SINGLE HANDED
GARDENER (some help given), willing to look
after pony and do odd jobs. Apply, with full particu-
lars, experience, references, to RICHARD, Giltspur House,
Chesham, Bucks.

WANTED, WORKING GARDENER
Vegetables and Fruit, no Glass. Apply by letter
to R. W. T. The White House, Oshott, Surrey.

WANTED, GARDENER, for Fruit and
Vegetable growing, willing to be useful, a cap-
able, conscientious man, about 55, or younger man,
if disqualified for military service, would suit; wages 7
sh. 6d. per week, with good cottage and garden. Stat-
family and give references. Reply GARDENER, c/o Mi-
Street, Heathside Nursery, Camberley.

WANTED, Good GARDENER, imme-
diately, for students' hostel, man or woman,
married or single, but work for wife if desired, St
Michael's, Grove Park, Lew, S.E. 12.

WANTED, GARDENER (meligible), to
work under Head Gardener, where others kept
good wages and cottage, permanent place if satisfactory.
Write, stating wages, with full particulars and refer-
ences, to HEAD GARDENER, Bunce Court, Evesham
Kent.

THOROUGHLY Reliable, Energetic MAN
willing and able to take control outside staff,
cult. Lilies, South London, must have good knowledge
Glenk work. Write, giving testimonials and wages re-
quired, to J. D., 204, c/o Dawson's, Lodenhall Street,
E.C. 3.

WANTED, MAN for Inside Work; Stat-
ing wages in previous places, also wages with or
without Betty, discharged or partly disabled soldier
would suit T. CARB, Redemuel, Enghelton Green,
Surrey.

WANTED, UNDER GARDENER, for
outside, duty alternate Sundays; pumping in
house, wages 28s. per week, good cottage and garden,
milk. Apply, stating age, particulars, to ALFRED
CHILD, Chesby House Gardens, Daventry, Northants.

WANTED, UNDER GARDENER; cot-
tage given. Write, stating wages and full par-
ticulars, LADY MERRION, Southbrook House, Berks.

WANTED, UNDER GARDENER, used
to Greenhouse and Stove Plants; single and mel-
igible. Apply, MRS. WAKEMAN NEWPORT, Smit-
bourne, Bewley.

WANTED, UNDER GARDENER, chiefly
outside, at a strong YOUTH, some experience.
Apply, stating age, wages, and reference, to W. H.
CLARKE, West Bank, Twickenham, Middlesex.

WANTED, as UNDER GARDENER,
Young lad or young Man (meligible), good wage
and comfortable place. State particulars to G. GREEN,
Portsmouth House, Fordingham, Somerset.

WANTED, FOREMAN (GENERAL); Single
(meligible), also FURKER MAX, for Homes,
good wages to suitable men, Betty, milk, and veg-
etables; Sunday duty and overtime paid. F. C. LEIGGE,
Castle Gardens, Arundel.

WANTED, FOREMAN, or Good, Capable
MAN, to take charge of Glass, 50s. per week,
Betty, &c.; duty and overtime paid—Full particulars,
A. BENNETT, Shelston Hall Gardens, Ashbourne,
Derbyshire.

WANTED, JOURNEYMAN and IM-
PROVER for the Houses and outside, good
wages, according to experience, with excellent Betty,
also milk, vegetables, and attendance, duty and over-
time paid extra. 1 o'clock Saturdays.—References and
particulars to GARDENER, Barford, Dorking.

WANTED, HEAD WORKING WOMAN
GARDENER (2 under); furnished rooms, coal,
light, and good wages.—FRANK SCHUSTER, The Hut,
Rayton-Thames.

WANTED, LADY GARDENER, to take
charge of small Garden and Poultry, comfortable
place; cottage available, or could live in.—G. B. RAN-
DOLPH, Steeple Aston, Oxon.

WANTED, LADY GARDENER and
LADY GROOM GARDENER; friends preferred;
help given; cottage. State wages.—WILDING, Stoke
Pages.

WANTED, Two LADY GARDENERS
(ASSIST); previous experience essential; good
wages, Betty, &c. Particulars to H. E. TYNDALL,
Tandridge Court Gardens, Oxted, Surrey.

WANTED, at once, strong YOUTH, for
Outside; must be experienced; wages 21s., with
Betty and WARD, Ken Wood Gardens, Hamstead, Lon-
don, S.W. 5.

WANTED, Active YOUTH for the
Houses, one with some experience preferred, but
not essential. State age and wages required, with Betty,
milk, and vegetables.—W. J. GUSE, Keele Hall Gardens,
Newcastle, Staffs.

WANTED, at once, strong YOUTH;
must be experienced, wages 18s. per week and
room. Address, HEAD GARDENER, Nonchuck Park,
Cleam, Surrey.

WANTED, Strong LAD, for Inside and
Out, wages 19s., overtime paid; 1 o'clock Satur-
days, comfortable Betty, &c. F. NORWOOD, Washers
Wood Gardens, Wokingham.

WANTED, IMPROVER for the Houses;
wages £1 per week, Betty, &c., duty paid extra;
1 o'clock Saturdays.—E. BRISTOW, Leyswood Gardens,
Growthbridge, Tunbridge Wells.

TRADE

WANTED, a CHARGE HAND for the
Tomato Houses.—W. WILFELDRON, Green Lane
Nurseries, New Eltham, London, S.E. 9.

WANTED, thoroughly experienced
GROWER, for Chumblers, Tomatoes, &c., general
and Nursery work, connected with the retail trade;
comfortable position for a good man. Write, with all par-
ticulars and wages required, to A. B., Box 10, 41,
Wellington Street, Covent Garden, W.C. 2.

PALM GROWER; thoroughly experi-
enced, wanted for London, meligible; good wages.
Write, G. P., c/o Gonals, 54, New Oxford Street,
W.C. 1.

WANTED, for our Trial Grounds, a cap-
able and experienced GROWER; meligible. State
age, wages, and full particulars of previous duties to
DICKSON & ROBINSON, The King's Seedsmen, Man-
chester.

WANTED, a Good, Practical GARDENER
for a small Both Farm in West of England where
Vegetables are also grown; must be married, sober, and
industrious, comfortable living quarters.—Write to B.,
Box 11, 41, Wellington Street, Covent Garden, W.C. 2.

WANTED, WORKING FOREMAN for
Branch Nursery, Fruit and Forest Trees; house
and garden provided.—Applicants must state wages re-
quired, with testimonials to JOHN PERKINS & SON,
52, Market Square, Northampton.

WANTED, WORKING FOREMAN for
Nursery of 20 acres, no Glass, must be well up
in Fruit Trees and have a knowledge of Trees, Shrubs,
Roses, &c., permanently. State age, wages, full particu-
lars, with testimonials to JOHN PERKINS & SON,
52, Market Square, Northampton.

SEED TRADE.—TRAVELLER—
Recommended by leading firm of Seed Merchants to
represent them in North Durham and South Northumber-
land; applicant must have thorough knowledge of the
Agricultural and Horticultural trades, good salary and
permanent situation to reliable man.—Write, stating age,
experience, salary required, and full particulars, to
TRAVELLER, Box 8, 41, Wellington Street, Covent Gar-
den, W.C. 2.

ON INCREASED FOOD PRODUCTION.

THE MULCH METHOD OF RAISING POTATOES.

THE difficulty of growing Potatoes without a change of seed is experienced no less in America than in this country. With the object of overcoming this difficulty experiments in growing Potatoes under a mulch were initiated some years ago by Mr. R. A. Emerson. The results of these experiments are now recorded. The stock of Potatoes used was of the Early Ohio variety.

The manner of making the test was to grow part of the stock under a mulch and part by the ordinary method of cultivation, and to test the seed thus obtained by growing it in subsequent years, partly under mulch and partly by ordinary methods.

Where mulching was practised the ground was covered, after planting the sets, with a depth of 4 inches of straw. The mulched ground was left without further cultivation throughout the summer, whereas the other part received frequent surface tillage.

As examples of the results obtained the following figures may be quoted. Stocks mulched continuously from 1904-1909 and mulched again in 1910, 622 lbs.; not mulched again in 1910, 537 lbs., indicating an immediate falling off in yield as a result of discontinuing the mulch. Stocks cultivated by the ordinary method fell off in yield year by year, but those cultivated under a mulch maintained their yield.

It is claimed that for every 100 lbs. of produce obtained from mulched plots there were obtained by the ordinary methods of cultivation an average of only 74 lbs., and it is further claimed that the quantity of home mulched produce is as large, and even slightly larger, than that from northern seed, the average results being mulched seed, 100; northern seed, 98.

The author states that any coarse material, provided it is put on to a depth sufficient to smother weeds, straw, old hay, or coarse stable litter, will serve for mulching. We confess that we are not yet convinced that this method will

enable English Potato growers to dispense with Scotch or Irish seed, and we believe that the mulching method has been already tried in England. At the same time, it is very desirable that experiments should be conducted with the object of ascertaining the effect of mulching in increasing yield. On newly broken up grass land the mulch might have a further advantage in keeping down rank growths of grasses and weeds, but an early mulch could hardly fail to affect soil conditions, particularly soil temperature, in an adverse manner. Perhaps gardeners who have the facilities will try a few rows of Potatoes under mulch and compare the results with those obtained by ordinary earthing up in the d.

VEGETABLES ON OLD PASTURE LAND.

ONE can now fairly estimate the results likely to be obtained on newly broken up old pasture. Many criticisms were put forth last winter on the subject of utilising vacant ground, and especially old pasture land, and many were, I am sure, deterred from making use of ground that would otherwise have been brought into cultivation. One of the principal objections was the likelihood of ravages by wireworm, but if good methods of cultivation are practised this trouble may be overcome; satisfactory results can be obtained, even the first year, and, generally speaking, such land once broken up will be similarly utilised for many years.

In this district I have had under observation many plots so treated, and I know of no single instance of serious failure. On the contrary, magnificent crops are now to be seen, which include nearly all kinds of vegetables. Much of the land has been deeply trenched, and where this has been the case the best results are obtained. *Ernie, Bolton, Aldham, Hart.*

SEED GERMINATION.

A CORRESPONDENT (see p. 42) states that, in the case of many temperate moisture, freedom from slugs and other pests, seeds rarely fail to germinate. Here is the problem: What are the necessary temperature and amount of moisture, and how are the conditions to be controlled in the germinator? As to old seed and new, I have this season noted that seedlings of Brassica have appeared in those lots from the same sowing. Is this mixed seed from different growers, or mixed seed of three seasons? The early failure we had was Purple Sprouting Broccoli. The germination of Runner and Dwarf Kidney Beans varied from 25 to 75 per cent., with one exception, Golden Butter, which showed at least 95 per cent. of first class plants. We grew six varieties of these Beans, from three good firms. Marrows, Gourds, Cucumbers and Tomatoes did not give us more than 50 per cent.; this may have been caused by too much moisture. Mercury, Good King Henry, or Lincolnshire Spanish sown in a box on March 3 showed one plant on the 25th, and kept coming for several months. I have had this experience before, when seeds have been sown immediately ripe, or they were allowed to drop. A somewhat interesting and, to me, inexplicable point in germination this season and last is Black Thyme; seed from the same packet has been sown at different times in various places from May last to June 7 of this year, without much success, until the last sowing, when, as if to make good for its previous behaviour, we got enough plants to stock the patch. I hope to try this seed next season. I have not been able to raise Tarragon from seed, although I have tried on many occasions. White, Scarlet, and Breder Runner Beans, also Dwarfs, have set fruit freely this season, the peck touching the soil in each case; this without my attention as to watering or mulching. The land was dressed with ground lime in late winter and early spring, or when early spring should have come, and no manure was used on June 16. I shall be grateful to any of your readers for a simple method of preserving the beans for winter use. *J. E.*

THE FOOD PRODUCTION CAMPAIGN.

IN previous reports it had been estimated that the total increased acreage in England and Wales (over the 1916 area) for the harvest of 1917 would be about 500,000 acres. This was a very conjectural figure, based upon reports made before the spring cultivations were completed, and, in view of the climatic conditions experienced, it would not have been surprising if the estimate had proved optimistic.

The preliminary figures of the annual agricultural returns have, however, now been received, and show that the increased area in England and Wales of Corn and Potatoes for the present harvest amounts to no less than 547,000 acres. These are set out in a summary as follows:

	Increase or decrease	
	Acres.	over 1916.
Wheat	1,911,000	1,000
Barley	1,450,000	+127,000
Oats	2,250,000	+145,000
Potatoes	504,000	+76,000
	Total	+349,000

Sir Arthur Lee, Director General of Food Production, discussing these figures, said: "This result exceeds all expectations, and affords some measure of the exceptional effort made by farmers this spring, in the face of unusually adverse conditions. It also indicates the immense value of the assistance given by the War Office by the loan of soldiers for work on the land." Without this help, and without the impetus given by the work of the Agricultural Executive Committee, composed mostly of farmers, landowners, and the like, it would have been impossible, not merely to effect an increase in this year's crops, but to avert a decrease which was at one time estimated at not less than 200,000 acres, as compared with 1916.

The net result of the Food Production campaign in England and Wales up to date may, therefore, be reckoned as an additional 550,000 to 600,000 acres of Corn and Potatoes for the harvest of 1917.

This, of course, is irrespective of the still greater relative increase achieved by the small grower. It is not possible to give accurate figures with regard to the small grower, but the estimate already made of a quadrupled area of small cultivation is probably well below the mark. It is estimated, for example, that the number of allotments in England and Wales has been increased by at least half a million; 12,000 acres of new allotment land is being cultivated under the Cultivation of Land Orders alone, and the displacement of flowers by vegetables has been general in gardens throughout the country.

SULPHATE OF COPPER.

THE arrangement for the sale of sulphate of copper for home consumption for agricultural purposes at the price of £50 per ton, in quantities of not less than 2 cwt. for at makers' works, ceased at the end of July. Representations have been made that the retail price of 94d. per lb., which was recommended in March last, is now too low for small quantities. The Food Production Department does not think that 8d. per lb. is an excessive price for sulphate of copper in England and Wales.

NEW POTATOES AT CHRISTMAS.

IN supplement of my previous notes on new Potatoes at Christmas, I would commend those interested in late Potato planting not to delay a moment, but at once to select some sheltered ground facing south, and protected as much as possible from the north-east wind. Turn it well over and loosen the earth with the garden fork, and lightly manure with fresh stable refuse (if obtainable); plant a whole seed Potato of last year at least 7 inches deep, covering it with loose soil. On the appearance of the plant above the surface, slightly press down carefully all sides within 2 to

* Home Mulched versus Northern Seed Potatoes for Eastern Nebraska. Bull. of the Agric. Exp. Station, Nebraska. By R. A. Emerson.

which is 1 to 2 inches, and is a hole to a depth of 2 to 3 inches with loose soil, so that the tuber may have all the earth protection it can get against prospective frost. On the appearance of frost, cover the whole plant with a layer of stable straw or other suitable material to protect the developing tubers below ground, when all will go well. Do not dig for Potatoes until two days before Christmas, and then only lift what are actually required for use, taking care to protect the plant next to the root lifted. *Joseph R. Holmes, Bourne.*

POTATO PROSPECTS.

The reports as to crops of Potato which are being grown by allotment holders who have

twelve between 250 and 500, thirty five received under 250 tons a piece. Five counties did not adopt the scheme. In some counties a proportion of the total distributed went through individuals and bodies other than the Executive Committees. The majority of these Potatoes were supplied to small men who were not in the habit of using Scotch or Irish seed Potatoes, and were ill-placed for obtaining seed at all through local agencies. Complaints have been singularly few. A considerable amount of loss occurred in transit. In the case of the Irish consignments, there was a certain amount of short weight. Some of the Scottish "seed" was very small, and there was a certain proportion of diseased tubers.

The Home Secretary has called the attention of Chief Constables throughout the country to the importance of preventing trespass on allotments, and has suggested that they should press for substantial penalties whenever convictions can be obtained. The Food Production Department points out that trespassing upon land is being dealt with under the Cultivation of Land Ordinance and recommends the public display of a statement that it is an offence under the Defence of the Realm regulations. Offenders are liable to a fine of £100 or six months' imprisonment, or both fine and imprisonment.

THE HOME CANNER FOR FOOD-CONSERVING.

A SERIES of food-conserving demonstrations have been given in the large central hall of the reorganised Economy Exhibition, in the new L.C.C. building, Westminster Bridge Road, London. From the opening day of the exhibition, the most attractive features have been the stalls at which elementary fruit bottling and canning were illustrated by representatives of the Horticultural Branch of the Food Production Department. So successful have the been that, on the invitation of the promoters of the exhibition, the Food Production Department took possession of the large central hall, formerly occupied by the French market. Lady Glover organised four kitchens with a view to showing visitors how various forms of food can be conserved in the simplest possible manner. At one of the kitchens demonstrations have been given in fruit and vegetable bottling, and the sulphur process of sterilisation; at another, kitchen fruit and vegetable drying was illustrated, women being taught how they can do this important work with oven or gas stove in their own homes. A third kitchen was devoted to jam-making with sugar substitutes. At a fourth the canning of fruit and vegetables in tins was demonstrated, the appliance shown being known as the "Royal Home Canner." This useful apparatus is capable of dealing with 56 2 lb tins at a time, and is compact and portable. It can be obtained from the Food Production Department, 72, Victoria Street, for £6 10s., carriage free.

A GOOD CARROT YEAR.

In corroborating the paragraph by J. N. (see p. 51), I may say I have had the opportunity of inspecting many hundreds of the Liverpool allotments, which cover an area of over eight miles north and south, and over four miles east and west, and in all cases the Carrots gave evidence of robust health, both in the old worked positions and in the newly broken-up ground. Carrots, with Parsley and Onions, are three most difficult subjects of cultivation in this neighbourhood, but this season all give evidence of more than average success. The soil is generally on the light side, and sowing was late owing to the delay in handing over the plots to the cultivators. May was a glorious month of refreshing rains, which, I think, accounts in a great measure for the more than average success of our gardens. *R. G. Waterman, Woolton.*

TOMATO BIDE'S RECRUIT.

This is a very prolific Tomato. The thickly-set trusses carry about twenty perfectly shaped, even sized fruits, and the fruits are entirely free from corrugation. *E. Molyneux.*

ROSE MERMAID.

This single-flowered Rose illustrated in fig. 22 was shown by Messrs. W. Paul and Son at the meeting of the Royal Horticultural Society held on the 3rd ult. It belongs to the climbing Wichmaniana section, and the large flowers are of light yellow colour, shading to golden yellow at the base of the petals. The anthers and stamens are also of a rich golden shade.

FIG. 22. ROSE MERMAID (MUCH REDUCED).
(Awarded R.H.S. Award of Merit on July 2, 1917.)

taken plots their total holdings exceeding 12,000 acres under the Cultivation of Lands Order of the Board of Agriculture and Fisheries are most encouraging. The seed Potatoes were forwarded direct by the suppliers to the distributing centres and consignees selected by the County Committees. Some 9,000 tons were obtained from Scotland, and about 200 tons from England, 400 tons of the latter being secured otherwise than through merchants; 8,600 tons were also purchased by the Department in Ireland through the Department of Agriculture and Technical Instruction for Ireland. The total quantity of Potatoes distributed was 15,558 tons (147,000 cwt.), and the number of consignments was about 2,700. One county took over 1,400 tons, three counties received between 750 and 1,000 tons each, six between 500 and 750 tons,

THE POLICING OF ALLOTMENTS.

As the crops on allotments are now maturing, the problem of policing the plots becomes more acute. There is no doubt that in many urban districts some method of policing is necessary. A certain amount of potholing is reported from some parts, and some wilful damage from others. It is stated that on the outskirts of one town a man had attempted to drive a horse and cart across the allotment field by way of a short-cut from one part of the town to another. Complaints are frequent of portions of allotment ground being used more or less regularly as footpaths. The special constables in most places have paid particular attention to the allotments, but obviously it is not within their power to keep watch during the whole twenty-four hours for possible marauders.

FOREIGN CORRESPONDENCE.

A SOLDIER GARDENER IN PALESTINE.

We have crossed the Sinai Desert, and passed from sandy desolation into the green, grassy plains and rolling downs of Southern Palestine. The Date Palm has apparently completely disappeared, and its place is taken by the Fig. There are groves of Figs, a few Pomegranates, Vines, and Almonds. The Almonds were near a native village. The plains are covered with the common grass—*Lolium perenne*—which grows everywhere in England, and a variety of couch grass is almost as universal, though none of the grass forms a carpet, as it does in England—the climate is too hot and dry. *Hordium jubatum* and the Sheep's Fescue Grass are also to be seen. What appears to be *Luzula campestris*, the English Field Rush, is also very common; wild Mustard grows abundantly, and the prominent stems of a species of *Polygonum* almost trip one up. *Trifolium* and *Lathyrus* enliven the herbage with their brilliant colours; *Asphodelus* forms large tufts, but has now passed out of flower; *Anthericum Lilium* and *Verhascum phoeniceum* both grow here, and a number of *Malvas* and an *Ipomoea* with pink flowers grow on the side of the wadis (dry river beds); *Salvia argentea* and *Cephalaria tatarica* grow in abundance, but the latter plant is not nearly so leafy or so tall as in England. There are *Thistles* of every kind, especially in the Wheat fields, where a species of green *Chamaecypripis* is common. *Linarias* in variety are common, and I have noticed *Omphalodes verna*, now passed out of flower. The weather just now (April 22) is fine and sunny, but with none of the blistering heat of the desert—just like an English summer's day. I should imagine that copious rains fall here in autumn and winter, but that the summer is hot and dry. The flowering period of all the wildlings has passed, the fruits are ripe and are bursting in the warm sun, and the seeds are being scattered by the breeze we always get during the day. I have mentioned only a few plants that I have noticed whilst grazing horses; but they are only a few of the great numbers to be seen. There is a large bulbous plant which grows here rather plentifully; the foliage has died down, and I have seen no signs of new or old flower spikes. I wonder if it is *Amaryllis Belladonna*; I have seen a pretty little Iris among the herbage, which I call (whether rightly or wrongly) I do not know) *I. reticulata*; it shines like a jewel in the dried pasture grass. In the Barley fields there is a little *Convolvulus* similar to that which flowers in our own cornfields, except that it has downy, trifoliate leaves. I have no doubt the flora is richer higher up; it is a wonder that any plants have the heart to flower in these sunburnt plains and downs within easy reach of a sandy desert. *F. Gooch* (formerly of Colbury House Gardens, Hill-Treet, Totton, Havts).

THE ROCK GARDEN.

ORCHIS FOLIOSA.

In the garden of Mr. John A. Holmes at Formakin, Renfrewshire, there are masses of the Madeira Orchis, *Orchis foliosa*, in the borders and rock garden. The plants are not only numerous (I question if there be anywhere in the United Kingdom so many plants in one garden), but they are exceptionally fine. Mr. Holmes assured me that he takes no special pains with *O. foliosa*, but divides it up when he wishes to increase his stock. The foliage is large and healthy, while the spikes of bloom, as I saw them, were of a grandeur unsuspected by those who only know the Madeira Orchis as seen in average gardens. The borders appeared fairly dry, but it is probable that the moisture underneath is abundant, although the upper surface is not heavy, and em- and drought-loving subjects were thriving admirably in moist cases in the same borders. *S. Traut.*

THE KITCHEN GARDEN

By J. DENN, Foreman, Royal Gardens, Windsor

SPINACH—Sow at once a good breadth of Spinach for winter supplies. Ground which has been occupied by early Potatoes requires no preparation beyond lightly forking and levelling. Sow in shallow drills drawn at 18 inches apart, and as soon as the plants are through the surface give frequent dustings of soot or lime to preserve them from slugs. Another sowing may be made a week later.

COLEWORTS—Any available space should be filled with the Coleworts Rosette and Hardy Green as soon as possible. Allow 16 inches between the rows and 15 inches from plant to plant in the row for early winter supplies. The Rosette may be planted in quantity, but the Hardy Green variety will stand the winter better, and there are very few green vegetables to compare with it in spring. Plantations may be made as ground becomes vacant until the end of August.

MUSHROOMS—The present is a good time to make preparations for October and November supplies of Mushrooms. The house which is used for this purpose should be thoroughly cleansed, and the walls washed with hot lime to destroy insects. The horse droppings should be placed in small quantities in a dry, open shed, and be well prepared by frequent turnings before being placed in the house. When a sufficient quantity has been got ready it should be removed to the bed and allowed to remain a day or two until the heat is about 85°. If turned and rained at this stage the spawn should be inserted in the bed when the temperature is slightly under 30°, and there is no danger of it rising. Make the bed quite firm by ranning, and after a few days place a covering of fresh loam over the surface and make it firm. Within six weeks the Mushrooms should be showing through the surface. In order to maintain an unbroken supply, a bed should be sown at intervals of a month throughout autumn and winter.

CUCUMBERS IN COOL, FLAT PITS—Mildew will be troublesome in these pits if the atmosphere be kept too moist, and red spider may appear if it is too dry. Let the foliage be thinned out, and all decaying leaves removed. When water is necessary it should be applied in the early part of the day, so that the leaves may become dry by night. Stop the growth as soon as it becomes necessary, and cut all fruits directly they are large enough for use.

FRENCH BEANS IN COLD PITS—All available pits should be planted with French Beans for cropping about the end of September. The soil should be thoroughly dry, and, if necessary, a quantity of decayed manure or old potting soil mixed with it. Allow plenty of space between the rows so that the plants may have sufficient light. The glass lights should be removed from the pit until later in the season, when it becomes necessary to replace them as a protection to the plants.

LETTCES AND ENDIVE—Seeds of Lettuce should be sown in a sheltered spot to produce a crop in October, and several small sowings will be necessary during August to ensure a full supply during autumn. Batavian Endive should also be sown now in a cold pit, and transplanted into spare frames and protected borders for use during the spring.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVEY, Abbots Wood, Godingham, Surrey.

PEACHES AND NECTARINES. Look over the trees daily and gather the fruits as they become ripe. Do not allow to remain on the tree too long they lose flavour. Those fruits which will leave the stalk easily are ready to gather, and should be taken and placed in a cool fruit room. Peaches to be despatched by rail should always

be taken before they are quite ripe. Later varieties will need good waterings at the root and daily washings with the engine or hose to keep down red spider and maintain the foliage in a healthy condition.

APRICOTS—These fruits should be promptly gathered as they become ready, both for dessert and for preserving. After the fruits are cleared give the trees a thorough syringing and watering, and if the soil close to the base is very dry and hard, make a few holes with a fork or bayonet and water to allow the ball to become moist, or the water may all run away and not have the desired effect.

PLUM TREES—The growths of Plums should be secured, and all unnecessary shoots pinched again. The trees should be kept clean by frequent washings with clear water, which will also help to keep the roots moist, more especially if a good mulch has been applied. Late Plums should be more severely thinned than early ones, and these can be used for preserving in various ways. Such first-class varieties as Jefferson's, Transparent Gage, Coe's Golden Drop, Kirk's, and Peach Plum need severe thinning, high feeding, and careful stopping and pruning. Large fruits of both dessert and kitchen varieties are very serviceable for bottling. Remove all suckers from the base of the trees.

EARLY PEARS—Doyenne d'Été and Citron des Carmes will soon be ripe. These are not of extra flavour, but are good when gathered and used at once; they will not keep when stored. Beurre Giffard is a better Pear, and must now be watched, as it may be ripening in some warm positions. The tree is a somewhat shy bearer when young. Jargonelle will be also nearing maturity. Later varieties should be supplied with moisture at the roots and as less growths taken away to allow the sun's rays to reach the fruits and growths. It is a good plan to use the hose to keep the trees fresh and healthy, and when this can be done in the evenings it cleanses the foliage and waters the roots at the same time. In this district there are enormous crops of the popular Williams's Bon Christian. See that all fruit trees are kept clean and free from aphid and American blight.

FRUITS UNDER GLASS.

By JAS. HUDSON, Head Gardener at Gunnersbury House, Acton, W.

MELONS IN HOUSES—Houses or pits that are sufficiently heated have a distinct advantage for Melon crops from this time onwards until the end of the season. Although we may still have some hot weather—as, for instance, in August, 1911—there may be periods of cooler weather with a superabundance of rainfall and a lack of sunshine, such as that through which we are now passing. During cooler weather keep a watch on the temperatures, both in the early morning and in the evening. If the thermometer ranges between 60° and 65° in the morning and between 65° and 70° at nightfall, it may be taken as a good standard. With more heat in the water pipes guard against too dry an atmosphere. Even with cloudy days make it a practice to ventilate for a few hours when the outside conditions are favourable, but close the house in time to raise the temperature somewhat during the afternoon. The latest crops should soon be safely set and swelling, after which stage keep the shoots pinched by means of the finger and thumb process. Before the weight of the fruits causes any strain on the growths, place them in Melon nets to take the weight. Should any plants be backward in setting, keep an eye on them and endeavour to secure a crop, even if a little late. I have known this to happen in the case of Hero of Locking in my own charge, and a most useful lot of fruit was secured quite late in the season. This variety keeps better than almost any other after it has been cut from the plant.

STRAWBERRIES IN POTS—Push forward the potting of the latest varieties for forcing. I like to see the potting finished by the middle of the month. In view of the heavy rainfalls the plants recently potted had better be laid on their sides if the water is seen to stand in the pots.

As soon as all the potting is done let the stock be stood out so as to cover the space at disposal. Do not be too persistent in pinching off any adventitious runners; rather let them run for a few weeks so as to encourage root action. Those of the autumn fruiting varieties that are now well rooted, and that have been treated as I advised in a previous calendar, will soon be ready for cutting off from the parent plant, and as these will soon show for flower keep the runners in this case pinched.

VINES THAT ARE BEARING CROPS.—With the heavy rainfall of the past few days, those growers who have experienced it will scarcely need to trouble about much more watering of the outside borders, even if they be well drained. Do not, however, let the inside borders suffer in the least for lack of water, but water them freely where the crops are still swelling. I would not hesitate to apply another dressing of an artificial vine manure, however, to both outside and inside borders. In doing this do not exceed the advice given with each bag of manure. Keep a close watch upon all vines in bearing for any symptoms of mildew; the weather of late has been congenial to this pest of the vine. Watch for and remove any scalded berries upon such varieties as Lady Downe's Seedling, and also give a look to all the bunches in the latest houses to see if a few small berries can be removed with advantage; continue to lift the top shoulders where needed.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Ganton Park, Reigate.

ODONTOGLOSSUM CITROSUM.—As plants of this Mexican species pass out of flower, attention should be given to any necessary repotting. These plants do not make many roots, and the receptacles should be only just large enough to accommodate them. Old dirty Orchid pans that may be suspended from the roof rafters are preferable to other pots or to covered baskets. Afford good drainage, cut away all moss, fresh pseudo-bulbs, and pot the plants freely. The atmosphere of the Mexican House is the most suitable for them, and for a few weeks after root disturbance the surface of the compost should be kept just moist, but towards the completion of its growth the plant should be thoroughly watered each time the soil becomes dry until the new pseudo-bulbs are fully developed, after which water should be gradually withheld. During their season of rest the plants should always be on the dry side until the lower scales are seen to be pushing from the young growths. All through their growing season the plants will be benefited by a warm, sunny position by day, with cooler and moister conditions at night.

OTHER ODNTOGLOSSUM. Such species as *O. Cervantesii*, *O. Humannianii*, *O. Galatrinum*, *O. Mathense*, *O. Rossi*, *O. maculatum*, and *O. aspersum*, that require repotting or re-surfacing, may be given attention at this period. They are best grown in shallow Orchid pans without side holes, and suspended from the roof of the cool house. Pot freely, and place the base of the plant just below the rim of the pan, and finish with a layer of Sphagnum-moss. Afford water carefully until the roots have grown freely into the new soil. While in full growth, the plants are benefited by light sprayings overhead several times daily.

LAELIA PUMILA. Plants of this species and its varieties are developing new growths, and as young roots are produced from their bases they should be repotted or resurfaced as may be necessary. These plants require liberal supplies of water at the roots during the season of growth, therefore it is important that the rooting materials should be sweet and porous. The ordinary shallow Orchid pans without side holes, and place a few cracks in the bottom, with the press of fern rhizomes over the top, gives the potting materials moderately firm, being of sufficient space for a layer of living heads of Sphagnum-moss over the surface. The plants should be exposed to a considerable amount of light and air at all times, and a plentiful supply of water at the roots is necessary when in full growth. Suspend them from the roof rafters in the cool house until the flowers begin to

show, when they should be removed by the intermediate-house. A suitable rooting medium for all the Orchids above mentioned is found in a mixture of equal parts of Osununda fibre and A 1 fibre cut in rather short portions, with an addition of crushed crocks and Sphagnum-moss.

THE FLOWER GARDEN.

By W. J. GRICE, Gardener to Mrs DEMESTER, Keele Hall, Staffordshire

PROPAGATING HARDY PLANTS.—Preparations should be made to propagate various hardy plants for the rock garden and herbaceous border. Partition a shallow frame into several compartments. Place 6 inches of sandy soil on a hard ash bottom and cover the compost with a thick layer of silver sand. The bed must be made quite level and moderately firm. Insert the cuttings with a blunt dibber, from 1 to 4 inches apart, according to the variety, syringing the compartment directly it is filled with cuttings, but do not close until the foliage is dry. Afterwards the frame should be kept closed until the cuttings are rooted. The frame must be syringed occasionally, and a light shading provided during bright weather. Admit air gradually when the cuttings are rooted, eventually removing the lights entirely. Plants that may be increased in this way are *Androsace*, *Campulanas*, *Phloxes*, *Dianthus*, *Androsace*, *Atenaria* and *Theris*.

CLIMBING PLANTS.—Plants growing in narrow borders are always at a disadvantage as regards moisture. Such borders need copious supplies of water, and a liberal mulch of some moisture retaining material, each time the roots have been thoroughly soaked. The thinning and training of young growths require constant attention, especially those of *Clematis*, *Vitis*, *Wistaria*, *Honeysuckle*, *Virginia Creeper*, *Jasmine*, and *Veronica*. Admit light and air to *Pyra-cantha*, *Chimonanthus*, *Cotoneaster*, *Garrya elliptica*, and *Ceanothus* by removing all weak, straggling shoots. Plants growing on pergolas, such as *Akebia quinata*, *Lycom europaeum*, *Begonia maculosa*, *Wistaria*, *Bridgesia spicata*, and *Clematis* need careful training to fill the spaces. The stock of climbing plants can be increased by layering, in the same way as for *Clematis*. Select suitable shoots as near to the base as possible and layer them in pots.

RAMBLER ROSES. Only a light pinning is essential at the present time. Remove weak or overgrown growths retaining sufficient to be flowering next year. In the climbing sections the old flowering branches should be removed as they pass out of flower. The new growths of plants trained on pergolas or walls must be carefully kept in shortening the straggles or removing the weak, as these may be lost. For a continuous display of bloom there are few climbing Roses to equal the variety *Graess* and *Ephzatz*. During dry weather copious supplies of leaf water, with occasional applications of liquid manure, will be beneficial.

PLANTS UNDER GLASS.

By J. G. WISSEY, Gardener to Lady NORTHOTE, Eastwell Park, Kent

MOSCHOEMA RIPARIUM. This is a useful indoor and conservatory flowering plant for the conservatory. Young plants should now be potted into 7½ and 2½'s, according to the strength of the plant. When re-established, the lights can be withdrawn altogether or the plants placed outside in ashes. *Moschoema* is a cross feeder, and should be potted in a fairly rich compost. Regular supplies of water are necessary during the growing season. Syringe the plants daily in the afternoon, and occasionally give a little clear diluted soil water. Pinch out the points of the shoots in the earlier stages of growth to ensure a bushy habit, but do not continue this too late in the season.

CAULOPHARIA CLIBRANNI.—When the plants of this *Caulopharia* have finished blooming, the older and tougher specimens should be discarded, and the remainder cut over and repotted in a cold frame. Do not give them much water at this stage, but provide light shading, and spray them overhead, keeping the frame merely damp to encourage the new growth. When this is sufficiently developed, the required number of cuttings should be taken off and propa-

gated. They will strike readily in boxes of sandy soil at kept close in a cool, damp frame. If large specimen plants are required for next spring, as soon as growth is fairly active put up some of the most promising of the year-old plants, and grow them steadily on in a cold frame. Use a fairly rich compost of turfy loam, well-rotted manure, and leaf soil in equal proportions, and give the plants a fairly liberal shift.

PRIMULA SINENSIS.—Give young plants in small pots a shift in good time. It is a good mistake to allow the plants to become pot bound, as they receive a check in growth, lose the good colour of their foliage, and become stunted. Use a light, open compost, and when potting see that the plants are firmly fixed in the soil at the collar. *Primulas* are sometimes sown so loosely potted that they fall over at the collar. This weakness generally arises in the first place, from being left too long in the seed pan, thus becoming drawn. Stand the plants in a cool frame, on an ash bottom, and shade lightly during hot sun. Water carefully, damp the plants overhead in the evening, and increase the amount of air. Seed may still be sown for a batch of plants for late-flowering.

STREPTOCARPUS HYBRIDUS.—Plants of *Streptocarpus* in full bloom require plenty of water this season. Keep all day-laying flowers picked out, for if the seed pods are allowed to develop the plants will soon cease blooming. If given constant attention in this respect, and weak liquid manure water, and an occasional dose of artificial manure, they will continue to bloom over a long period. Give abundance of air when the plants are in flower, and keep the house cool and well shaded. Seedlings required to flower in the autumn should be potted in a light, open compost similar to that recommended for *Primulas*. Do not overpot at this season; the seedlings will flower nicely in 60 and 54 sized pots. Set aside some of the finer forms, and allow them to carry a few seed-pods.

FREESIA.—As *Freesias* require a long season of growth before reaching the flowering stage, if they are required for blooming about Christmas time, the bulbs should be potted without delay. Bulbs that were left in the pots after being dried last spring should now be shaken out of the soil and graded. Do not pot large and small bulbs together or the growth will be irregular. A compost of loam and leaf soil, with some sharp sand added, will suit them very well, and 3 to 4 inch pots are suitable sizes. If the soil is in proper condition for potting, i.e., neither dust dry nor pasty, no water will be required; but if the soil is very dry one good watering should be given. Stand the pots closely together in a cold frame, and place a little sifted leaf mould on the top of the soil in the pots, to keep it from drying too quickly. The frame should be shaded until growth starts. Directly growth has begun shake off the leaf soil and give the frame ample ventilation. Afterwards expose the plants to sun and air, and give only very moderate supplies of water until the pots are filled with roots, when they will require a good quantity.

PRIMULA OBSCURA. If well grown this *Primula* will flower continuously for many months. Seed may be sown from May to August, to obtain a succession of good plants. Other good *Primulas* include *P. malacoides*, in various shades, and *P. Kewensis*, which makes a good contrast, the flowers being of a rich yellow. All these succeed under ordinary cool frame treatment, and will stand a cooler temperature than *P. sinensis*.

MARGUERITE MRS. F. SANDER. This double white *Marguerite* is a capital pot plant. Cuttings should be put in now to secure a batch of decorative plants in small pots. Cuttings inserted in boxes or pans of light, sandy soil will strike readily in a close frame or warm, shady house. As soon as they are potted transfer them to small pots, using light, rich soil. Grow them on in a light position in a house or frame. Pinch out the points of the shoots once or twice to ensure a bushy habit. Pot them again as soon as the roots show round the sides of the pot until the plants have been placed in their flowering pots. After they have filled these with roots, bed them with manure water.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications and queries for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, kindly observe our conventions or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their contributors.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the Editors, 41, Wellington Street, Covent Garden, London, W.C. Contributions should be written on ONE SIDE ONLY of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 62.4.

ACTUAL TEMPERATURE
Gardners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, August 9, 10 a.m., Bar, .3, temp 65.5, Weather Very dble.

Gardening Forethought.

There is no occupation which demands more forethought than does gardening, and therefore advice to gardeners on the importance of exercising forethought at the present time is not likely to fall on deaf ears. Assuredly, it cannot be urged too strongly that everyone can lend real assistance to national efficiency by "sitting down and taking thought" with respect to his next year's requirements. The best time to begin to consider the cropping of and distribution of crops in the garden is not when the ground is bare, but now. That done, a decision may be reached on the amount and kind of seed to be ordered, the quantity of manure—natural and artificial that will be required, the kinds and amounts of Potato seed, the supply of lime or chalk needed to maintain fertility or to exterminate such pests as club-foot, and the garden tools which require to be purchased or mended.

If everyone with a garden or allotment will take stock early of the needs of his land he will be making a very real contribution to the efficiency of the State; for he will be in a position to place his orders at an early date, and thereby both assist the traders working with depleted stocks and ensure for himself that the materials he requires will be received in time. Few who are not engaged in industry or administration realise the severe difficulties which have to be overcome in carrying on under present conditions the normal and necessary business of the State. By everyone taking thought these difficulties would be mitigated to some extent. It is therefore putting an illegitimate burden on the already overtaxed word patriotism to say that the exercise of forethought is an exercise in patriotism. General considerations

suffice to demonstrate that provision, always to be encouraged, is of very great national value at the present time; but there are other particular reasons for forethought which are not so apparent. Everyone knows that it is desirable to maintain exports at the highest possible level. Certain materials which are exported are also required for home use, and export in the case of these materials can only be undertaken after provision has been made for home requirements. Hence it is no extravagance to state that the home users of a commodity coming under this category can assist the welfare of the State by making the earliest possible estimate of their requirements and by placing forthwith their orders with the trade. For example, the only nitrogenous artificial manure available at present is sulphate of ammonia. This fertiliser is, as is well known, manufactured in this country. Enough of sulphate of ammonia must be set aside to meet home requirements. As soon as that has been done and not before the amount available for export can be determined. For these reasons farmers and gardeners are advised to form an estimate of their requirements as soon as possible and to place their orders. With the object of encouraging this course of action, the price of sulphate of ammonia has been adjusted in favour of the early purchaser.

There are many other commodities the early ordering of which for similar or other reasons is greatly to be encouraged. Hence the importance of forethought, not only with respect to garden, but also with respect to household, needs.

SUBSCRIPTION TO THE "GARDENERS' CHRONICLE." In accordance with the announcement published in our last issue, the price of the *Gardener's Chronicle* has been raised to fourpence. During three years of war our readers and advertisers have supported us in such a steadfast manner that it has been possible during that long period to keep the price unaltered, and we had hoped that this might have been the case until the termination of the war, notwithstanding the continuous increase of the cost of production. In spite of the support still so liberally given us, however, there is evidence at the beginning of the fourth year of still further increases in the costs of production, particularly with respect to the supply of paper, and it has hence become imperative to add one penny to the price. We are confident that our readers will recognise the cogency of the reasons which have made the change inevitable. The original price of the *Gardener's Chronicle*, from 1841 to 1862, was sixpence, and from 1862 to 1867 fivepence, when a decrease in the cost of production allowed of the reduction to threepence.

DESTRUCTION OF WEEVIL IN PEAS AND BEAN SEED. By subjecting Peas and Beans seed brought into the warehouse to the vapour of carbon bisulphide, American seed houses find that weevil is destroyed. The treatment, which is cheap, is carried out in an airtight chamber with double doors. The seed is shot direct from trucks into the chamber, subjected to the vapour arising from liquid carbon bisulphide, and then stored in the usual way.

LONDON ALLOTMENTS.—The persistent bad weather of last week prevented their Majesties the KING and QUEEN from carrying out their projected visit to London allotments. The tour of

inspection had been fixed for August 4, and Mr. Phipps, the President of the Board of Agriculture whose interest in "petite culture" is well known—was to have accompanied their Majesties.

BRITISH GARDENERS' ASSOCIATION.—We are informed that the members of the British Gardeners' Association have, by an overwhelming majority, decided to register the Association under the Trade Union Acts.

THE NATIONAL FRUIT GROWERS' FEDERATION.—It is satisfactory to learn that the National Fruit-growers' Federation is to be completely reorganised, with the help of Mr. DUNCAN GIBBS, of Pershore, as secretary. In the past the association has been a feeble and inactive body, which has not gained, as it has not deserved, the confidence and effective support of fruit growers generally. The new secretary has a high reputation for energy and business ability, and he will do all that he can to render the Federation effective. A new president, Major WHEELER, M.P., has been elected, and a vice president and a representative council are to be chosen. It is desired that every county in which fruit is grown extensively shall be represented in the council, and that local fruit growers' associations will affiliate to the central body. It is hoped that fruit growers generally will give the revived Association a good start, by joining and supporting it. By combination alone can they secure from the Board of Agriculture and Parliament the attention and consideration which their enterprise requires.

ACID PHOSPHATE FOR ROSES AND CARNATIONS.—Trials of the relative values of acid phosphate and bone meal as fertilisers for Roses and Carnations have led Professor F. W. MERRICK, of the Illinois Agricultural Experiment Station, to conclude that acid phosphate is to be recommended in preference to bone meal. Two sets, each of 144 plants of the Roses Richmond and Killarney, were treated, one with acid phosphate at the rate of 20 lbs. to 100 cubic feet of soil, and the other with bone meal of equal money value. The plants which received acid phosphate gave from September 15 to December 18, Killarney 2,391 blooms, and Richmond 2,069, as against Killarney 1,918, and Richmond 1,792, with bone meal. The application of acid phosphate to carnation soil led to an increase of bloom at the rate of 500 flowers to each 1,000 plants.

THE REMOVAL OF SNOW.—Although entirely unseasonal, it seems worth while to put on record the simple and efficacious method of removing snow practised by nurserymen in the colder parts of America. The path to be cleared is sown with finely powdered dark soil. As a result, the area so treated is ready for planting much sooner than would otherwise be the case. The method deserves the attention of municipal authorities in this country.

LOCAL SOCIETIES.—On July 19, the Freshwater Isle of Wight Horticultural Society held a garden produce exhibition, instead of their usual annual horticultural show. Over 250 exhibits were staged in the Rectory field. A handsome silver cup, which was the chief trophy, was won by Mr. W. STEPHENS. The annual summer show of the Wood Green Horticultural Society was held on July 21, and was chiefly remarkable for the excellent quality of the vegetables shown. The show was held in the Town Hall, and the local allotments were well represented by varied produce of good quality. A floral fête was organised on July 27, in Belfast, by the Irish Rose and Floral Society, in aid of the Sailors' and Soldiers' Service Club. The show took place in the Ulster Hall, and was opened by Viscountess BANGOR, accompanied by Lord BANGOR. There were many fine exhibits, including non-competitive displays by the leading Rose firms, notably MESSRS. ALEX. DICKSON AND SONS, MESSRS. HUGH DICKSON, LTD., MESSRS. S. McGREERY AND SON, and the DONARD NURSERY.

SIR HARRY AND LADY VEITCH.—All horticulturists will join us in offering to Sir HARRY and Lady VEITCH the heartiest congratulations on the celebration of their golden wedding, which occurred on Monday last. May they both be spared long to enjoy the comparative leisure which has succeeded long and strenuous days devoted so ungrudgingly to the public good, and in particular to the spread of horticulture in all parts of the world. The design shown in fig. 23 is taken from the commemorative card.

PEACHES AND NECTARINES.—Now that the outdoor Peaches and Nectarines are ripening, evidence of the bountiful crop may be seen in the markets and fruit stalls, where large numbers of these choice fruits are exposed for sale. Nectarines of the best quality, but of moderate size, are being sold at fourpence each, even in the fashionable shops. Earlier in the season, however, the fruits realised very high prices. One large grower informs us that he has sold consignments at 30s. a dozen. Those who remember the extraordinary exhibits of Mr. GEORGE WOODWARD, of the Bathin Estate Gardens, near Maidenhead, made at the R.H.S. Show at the Crystal Palace in 1902, to show the disastrous effects caused to the hardy fruit crops in that garden by hailstones, will be sorry to hear that three weeks ago the same garden was visited by a hailstorm only less disastrous than that of 1902. Hundreds of Peaches and Nectarines have been taken from the trees owing to hail-storm injury. The storm caught the south and west walls principally, and it is fortunate that a good number of the trees on east walls escaped. But for the unfortunate visitation, Mr. WOODWARD estimates that he would have marketed this season something like fifteen thousand Peaches and Nectarines. The storm was very local, and in its greatest severity was confined to an area of six acres, where the hailstones are described as having resembled great pieces of ice. Outside this radius they were only of ordinary size.

FRUITS IN SEASON.—Messrs. W. STAMBOOK AND SONS, Chelmsford, send us a sample of some Black Currants of a variety they have found to be immune from attacks of the Curculionid mite. The name of the variety is Chelmsford Black, it is described as being an exceedingly heavy crop, and as bearing fruit over a very long period. The fruits remain sound on the trees, after they are ripe, for about four weeks. We are told that it has been cultivated by Messrs. STAMBOOK AND SONS for thirty years, and that the bushes have never been attacked by the mite, though grown among plantations of other varieties which have been badly affected.

FLIES AND MANURE.—The subject of the house fly is ably dealt with in a leaflet lately issued by the School Nature Study Union, entitled *The House Fly and Its Kinfolk*. The difference between the house fly and the some what similar out door species is pointed out, and means indicated for the reduction of its numbers. The danger to health of the plan of dumping horse refuse on waste ground is emphasised, and the opinion expressed that all such refuse should be immediately taken to the destructor and burnt. The domestic dustbin can be rendered less attractive to flies by the use of disinfectants, but the reader of the leaflet is warned against using horse refuse which has been thus treated as manure, unless it is well known that the disinfectants used are not harmful to plant life.

WAR ITEM. Mr. A. J. WAIN, formerly Superintendent of the Shrewsbury Public Parks, who is serving with the Royal Garrison Artillery, was selected by the Navy and Army Canteen Board Committee to take charge of one of their Government farms in Dorsetshire. The application has, however, been refused by the Army authorities, as Mr. WAIN is shortly to be attached to a siege battery for service abroad.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See also Tables in *Gardeners' Chronicle* for July 23.)

(Continued from p. 46.)

4.—MIDLAND COUNTIES.

BEDFORDSHIRE.—Goozeage. Plums are cropping very well this season, and Damsons are exceptionally heavy. All other varieties are poor. Early varieties of Strawberries yielded a poor crop, but Givon's Late Profusion bore exceptionally well. Where the spraying of Apples has been neglected the crop is poor, but where the spraying has been attended to there are some good crops, and the trees remarkably free from insect pests. W. H. NODD, *Woburn, King's Fruit Farm, Rothmoor, Aspley Guise.*

Fruit trees in general are looking better in this district than they have been for several seasons. A. J. BELL, *Luckwell, Princes Risborough, Bucks.*

The fruit crops in this district are very satisfactory, the trees keeping clean and healthy. The absence of frost in spring permitted a good set of fruit. WILKIN BROOKS, *Mossenden House, Aylesham.*

The fruit crops in this neighbourhood are, on the whole, up to the average. Early dessert and culinary Apples are carrying good crops of clear fruit, but late varieties like Newtown Pippin and Bleheim Pippin failed to set. Pears and Cherries are excellent. Peaches and Nectarines are over average, and the trees are clean and healthy. Strawberries were small, and the crop a light one; the plants suffered from the late frosts in April, and were late starting into growth. Bush fruit of all kinds are doing well. Black Currants and Gooseberries are extra good. CHAS. PAGE, *Drayton Gardens, Maidenhead.*

CIRENCESTER. With the exception of Apples and Strawberries, the fruit crops are satisfactory. Caterpillars attacked the Apple trees suddenly and severely, especially where spraying had not been carried out. Many trees in the orchard, however, appear to have escaped, and are carrying good crops. The severe winter damaged

FIG. 23. SIR HARRY AND LADY VEITCH.

The weather was a fine show of Apple bloom which have not failed to set a full crop. The weather was too variable, but bees are very scarce in the district. There was no late frost. Pears are bearing a heavy crop. LARTON BROS., *Bell Busk.*

The fruit crops are very fair. Apricots are not quite up to expectations, but Peaches are bearing a splendid crop. Apples look very promising; the trees are fairly healthy. Strawberry berries have been abundant and very fine. Gooseberries and Currants are yielding good crops, but I have never known caterpillars so trouble some before. Filberts look very promising and Walnuts fairly so. THOS. H. STANTON, *Hawick Hall Gardens, near Wellingborough.*

BUCKINGHAMSHIRE. Apples, Plums, and bush fruits are much above the average. Strawberries blossomed freely, but the crop was much under average, both in quantity and quality. Fruit trees are, on the whole, healthy and clean, though Gooseberry bushes were badly attacked by caterpillars, and the foliage considerably damaged. Our soil is a heavy, retentive loam resting on clay, and the natural drainage is bad. W. HEDLEY WARREN, *Easton Chilton Gardens, Tring.*

The Strawberry plants, skinned, then of foliage, with the result that they threw up weak flowers, and the crop was small and third-rate in quality. CHARLES BLACK, *Cholmondeley Castle Gardens, Malpas.*

The season has been favourable for fruit generally, a late spring always suits this locality. The best crops of Apples are in such varieties as Grandeur, Pott's Seedling, Lord Suffield, Kew-ack Codlin, and Mer-de-Ménage. Raspberries, Gooseberries, Damsons, and Victoria Plums are bearing very heavy crops. JAMES ALLEN, *Stockton Lodge Gardens, Hail Croft, Stockport.*

The condition of the fruit crops proves the truth of the old Cheshire proverb, "a late spring for Cheshire," for after an exceedingly severe winter and backward spring, the fruit crops in our neighbourhood are mostly very abundant, especially Damsons, Pears, and Apples. An early spring is detrimental owing to the low set of fruit and late frosts. ALFRED N. JONES, *Morley Hall Gardens.*

There is every prospect of record crops, and so far the fruit is of excellent quality, and freer from pests than I have known it for some years past. P. HOLT, *Moon House, Middleton.*

HEREFORDSHIRE. The fruit crops in this district are very promising, but late. We had good conditions for the setting of the fruit, and favourable weather since; everything points to plentiful crops of all kinds. *J. Morfeld, Durbly Abbey Gardens, Durbly.*

HEREFORDSHIRE. The fruit crops here are good, with the exception of Plums. Although the Plum trees were laden with blossom, the flowers failed to set, the weather at the time of flowering being dry and cold. Things were different when the Apple trees were flowering, the weather being showery; these set well, and many trees have shed a number through over-crowding. The caterpillar plague has been bad, and measures must be taken to combat this evil; they destroy a number of fruits. The soil here is a very heavy loam, suiting fruit trees admirably. *William Fulford, Sulgrave House, Aldenham, Watford.*

The late season and absence of late frosts was conducive to a splendid set of all fruits, but what promised to be a bumper crop has been adversely affected by the long drought. Pests have not been so injurious this season as on some previous occasions. Peach leaf blister has also been less prevalent. The soil here is a very heavy loam overlying the London clay. *E. F. Hazleton, North Myms Gardens, Hatfield.*

(To be continued.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

RAMBLER ROBES FAILING TO BLOOM.

Insufficiently ripened wood is often the cause of Ramblers failing to bloom, especially when they are planted in a shady position and get very little sun. In such a position Ramblers will throw up green canes, but they remain sappy and fail to ripen or bloom. Where such is the case it is a good plan to stop the canes in June or early July and thus give them a better chance to ripen and throw out plenty of flowering wood the following year. This is worth noting for next year. *A. J. Gurr, Easton Hall Gardens, Grantham, Lincs.*

CARBON BISULPHIDE AS AN INSECTICIDE.

I notice in your issue of Saturday last, on p. 45 (R.H.S. Scientific Committee), a note on ants attacking the flowers of *Lilium regale*. The best remedy is extermination by means of carbon bisulphide (C.S.₂), which, while poisonous to insects, seems to be harmless to plants, in the open at least. The ant brings with it scale insects and even fly, and places them on plants conveniently situated for its own use. C.S.₂ can be used to kill many insect pests which make their abode in the garden. It is no doubt poisonous, and explosive when the vapour is mixed with air, but it evaporates fairly quickly. I have used it for killing ants and wasps in the rock garden, and have never seen any bad effects. Two fluid ounces poured into the entrance of a wasp nest in the ground, preferably after dark, will usually kill every wasp. To eradicate ants, pour the liquid into holes made in the soil where they are working, covering the ground to prevent any rapid evaporation. *William Lowe, Bullockwean, Margkirk, Kinross, Fife-shire.*

FRUIT TREES ON GRASS.—The orchard on grass has hitherto been left to take care of itself in most cases, never pruned, and frequently never manured, and yet some very good fruit has been grown in such conditions. Some years ago I was acquainted with a gardener on a large estate who lived in one of the entrance lodges, and who took great pride in an Apple tree which was growing in a grass lawn in front of the cottage. The soil was shallow and of a nature where tender might be expected, but his tree was a perfect specimen, and no tree wherever or however grown could have been vainer or more productive, or give better fruit. He always used it as a lesson to people in the neighbourhood who said they could

not keep trees healthy in such soil. I think it is well established that the colour of the fruits is better in grass. I have found it so. I had two trees within 30 feet of each other, one over grass and one without. The difference in colour was very marked, and both were identical in age, size and variety. I am strongly of opinion that if trees on grass were looked after as carefully as those in cultivated ground, the difference in results would be, apart from colour, practically negligible, and that they would not be great enough to warrant the expense of hoeing. An orchard need cost nothing at all for grass cutting, as grass would do that perfectly, and help to enrich the ground. Taking everything into account, I think that if the soil be good orchards on grass pay the best. As I always point out, in a state of nature trees flourish in grass. I should like to know why the colour is higher on grass and the fruit ripens sooner, as it was in my case. Of course, this isolated instance is not enough to prove that such is always the case, but others have observed a like result. I know of some Rose trees with grass right up to the stems, but they look quite healthy. One tree has been grown in such conditions for about ten years to my knowledge, and flowers freely. Trees of all kinds look well in grass, and that counts for something, too. Perhaps for the first two years it is best to keep the soil cultivated. Mine was cultivated for four years before sowing the grass round the trees. *W. J. Farmer, Ye Hill, Redruth, Cornwall.*

INTENSIVE CULTIVATION.—Some articles on intensive farming appeared recently in the *Scottsman* which demonstrate the big advance made in recent years by progressive agriculturists in Scotland. The increased crops are said to be due to the use of fertilisers in larger quantities than formerly, to improved varieties of Oats, and in Potatoes, among other things, to the practice of sprouting the seed-tubers previous to planting them. Deep cultivation always forms a part of intensive farming, but I did not notice that this fact was emphasised. The lack of potash is not a worry to the progressive farmer so long as he has "super," sulphate of ammonia, and lime; and the improved percentage he has reached is not the limit, for much larger crops are anticipated in the future. It means, however, that larger capital is necessary than was required hitherto, and it means also, not improbably, the elimination of the small holder, who, in the future, will be seriously handicapped by the rise in prices for labour, artificial manures and seeds. Is gardening also progressing at the same rate as high-class farming? Or, in other words, are gardeners turning out larger crops than were produced twenty to fifty years ago? The farmers have left the old-fashioned theories about the amount of manure required for crops far in the rear, and it is patent to all who have carried-out experiments that garden crops are capable of assimilating an amount of manure, animal and mineral, far in excess of that assumed to be sufficient by authorities. In fact, ground may be cropped and re-cropped without cessation and continue to yield unaltered returns, provided that the soil, by means of renewed applications of manure and good cultivation, is never allowed to lose its fertility. No crop shows this to be the case more clearly than Grapes. The theory that Grape vines are worn out after ten or twelve years' cropping is exploded. They will crop indefinitely, and always abundantly, provided they are fed, not intermittently, but continually. So with Cucumbers; the number of fruits that the plants will produce, provided the fruits are cut young and the plants grown with abundance of manure, is enormous. It is usual to restrict the crops far below what the plants are capable of producing. Again, with Cabbages, Onions, and many other crops, we fail to gain what the soil is capable of producing, because we do not know how much manure it is capable of turning into vegetable food. I planted a few hundred-weights of Potatoes with very considerable misgivings this season, owing to the diminutive size of the seed sets. The result so far is excellent. *R. P. Brothers-ton.*

SOCIETIES.

MIDLAND CARNATION AND PICOTEE.

JULY 27 AND 28.—The annual show of this Society was held at the Botanical Gardens, Edgbaston.

Although the display was not a very extensive one, and many of the flowers were under-sized, the quality was good. The old-fashioned way of showing Carnation flowers with stands and neat white paper collars still finds favour at Birmingham, but the flowers exhibited in vases with Carnation foliage produced a more pleasing effect, and were greatly admired by visitors.

In addition to winning six of the eight first prizes in the classes in which they were eligible to compete, Messrs. A. R. Brown's flowers also secured five premier awards. With the exception of Mr. S. Hyslop, of Langholm, Scotland, all the exhibitors came from the Midlands.

FIRST DIVISION (OPEN). FLOWERS SHOWN IN VASES.

Three classes were reserved for flowers staged in vases without cards. Competition was weak, Messrs. A. R. Brown, Ltd., King's Norton, being the only exhibitors in the leading class, which required 60 blooms of Carnations and Picotees in 12 varieties, arranged in fives on a space of 5 feet by 3 feet. Any section except Bizarres and Flukes was admissible, but not less than 3 vases of selfs, 2 of yellow-ground Fancies, 2 of yellow-ground Picotees, 1 of white-ground Fancies, and 1 of white-ground Picotees or Fancies other than white or yellow grounds were to be included. Messrs. A. R. Brown, Ltd., who were awarded the gold medal, had a beautifully arranged collection, which included 3 premier blooms. The varieties shown were as follows:—Frank Gottwaltz, Eclipse, Lieutenant Shackleton, Mrs. A. Bisterstone, J. C. Nitten, Betty, Bookham White, E. V. Lucas, Fortrose, W. L. Hodgkinson, Innocence, and Cayenne.

The same exhibitors also secured 1st prize in the next class, which was for 6 vases of self Carnations dissimilar, 3 blooms of one variety in each vase. Titan, Dora Blich, and Wyatt were shown in splendid condition.

See Vases of White-ground Picotees.—1st, Mr. C. H. HERBERT, with shiny flowers of Mrs. Hammond, Silas Osbaldeston (Premier), Fair Maiden, Gaynede, Fortrose, and Clytie; 2nd, Messrs. A. R. Brown, Ltd., whose specimens of Helen, Osprey and Lady Schil were very attractive; 3rd, Mr. T. M. TRAFFER, Solihull.

SINGLE BLOSSOMS ON STANDS.

Twelve Self Carnations, Dissimilar.—1st, Messrs. A. R. Brown, Ltd., with Henry Brett, Ann Hathaway, Mrs. Howard Green, Attraction, Cardinal, Gordon Douglas, Rosy Morn, Mrs. Arthur Trow, Irene, Jim Bludso, E. Shiffin, Irma, and J. C. Miller; 2nd, Mr. E. G. REED, whose best flowers were Bookham White, Mrs. F. W. Flight, Mrs. E. Douglas, Wyatt, and Earliest North (Premier).

Twelve Fancy Carnations, Dissimilar.—1st, Messrs. A. R. Brown, Ltd., with handsome flowers of Brilliance (Premier), Dr. Wilkinson, Pal of Mine, Butterfly, Lieutenant Shackleton, Frank Woodward, Watchman, Stanislaw, Linkman, Harry Woodward, and Maxed; 2nd, Mr. C. H. HERBERT.

Messrs. A. R. Brown, Ltd., won first prizes in classes for (1) Twelve Yellow-ground Picotees, and (2) Twelve White-ground Picotees, with very refined flowers. Mr. T. M. TRAFFER and Mr. C. H. HERBERT also showed well in these classes. The best stand of Twelve Flake or Bizarre Carnations came from Mr. C. H. HERBERT, whose exhibit included two Premier blooms, viz., St. Kenneth (Bizarre) and Cleopatra (Flake).

SECOND DIVISION (AWARDED). FLOWERS SHOWN IN VASES.

The principal class was one for 56 blooms in 12 varieties. The competition was good, and flowers of excellent quality were included in the five exhibits placed before the judges, who

awarded the gold medal offered as first prize to Mr. T. M. TRAMER, whose flowers were undoubtedly for their high culture and refinement. The varieties exhibited were Becky Sharp, Hercules, Lord Steyne, Onward, Rosy Morn, Dona Bick, Innocence, Mrs. J. K. Kent, Hidalgo, Mrs. E. Douglas, The Nizam, and Favourite; 2nd, Mr. E. KENWRIGHT, Smethwick, who had splendid flowers of Bunny, Bookham White, Lukman, John Kidd, and Margaret Lennox; 3rd, Mr. S. HYSLOP, Lake House, Langholm.

For three vases of self Carnations, dissimilar, Mr. E. KENWRIGHT won 1st prize with exquisite examples of Rosy Morn, Gordon Douglas, and Bookham White; 2nd, Mr. T. M. TRAMER, whose vase of Bookham White was very lovely.

The best three vases of white ground Picotees was exhibited by Mr. A. HALL, Harborne, and the varieties were Innocence, Fujiyama, and Border Yellow; 2nd, Mr. J. M. CAMM, Smethwick.

FLOWERS SHOWN ON STANDS.

Six Self Carnations.—1st, Rev. C. A. GOTTWALTZ, Hadzor, Deputwith, with lovely specimens of Madame Apollonia, Mount Everest, Mrs. Berkeley, Gordon Douglas, Armstrong, and Irma; 2nd, Mr. E. KENWRIGHT; 3rd, Mr. J. D. WILLIAMS, Smethwick.

Six Fancy Carnations.—The last named exhibitor led with Becky Sharp, Edenside, Sweetheart, Lord Steyne, Linkman, and Margaret Thurston; 2nd, Mr. E. KENWRIGHT.

Six Yellow ground Picotees.—Mr. J. D. WILLIAMS excelled with Margaret Lennox, Onward, Santa Claus, Edipse, F. W. Goodfellow, and Togo; 2nd, Rev. C. A. GOTTWALTZ, who showed W. L. Hodgkinson in fine condition; 3rd, Mr. E. KENWRIGHT.

Six White ground Picotees.—1st, Mr. J. D. WILLIAMS, who showed superb flowers of Gany mede, Carrie Goodfellow, and Mrs. Opushaw; 2nd, Rev. C. A. GOTTWALTZ.

Six Flats or Bicolor Carnations.—1st, Mr. T. M. TRAMER, with Edmet Houglave, Meteor, Black Diamond, Geo. McVillie, Sir Kenneth, and Admiral Curzon.

PREMIER FLOWERS (DRESSED).

Bicolor Carnation.—Sir Kenneth, exhibited by Mr. C. H. HERBERG.

Flake Carnation.—Chloëdra, exhibited by Mr. C. H. HERBERG.

Heavy edged White ground Picotee.—Gany mede, exhibited by Mr. E. KENWRIGHT.

Light or White edged White ground Picotee.—Clyde, exhibited by Mr. C. H. HERBERG.

Heavy edged Yellow ground Picotee.—Her Majesty, exhibited by Messrs. A. B. BROWN, LTD.

Light edged Yellow ground Picotee.—Onward, exhibited by Mr. C. H. HERBERG.

Yellow ground Fancy Carnation.—Brilliance, exhibited by Messrs. A. B. BROWN, LTD.

Self Carnation.—Furthest North, exhibited by Mr. R. G. RUD.

PREMIER FLOWERS SHOWN IN VASES.

Self Carnation.—Bookham White, exhibited by Messrs. A. B. BROWN, LTD.

Fancy Carnation.—Edenside, exhibited by Mr. S. HYSLOP.

Yellow ground Picotee.—W. L. Hodgkinson, exhibited by Messrs. A. B. BROWN, LTD.

White ground Picotee.—Silas Oshaldston, exhibited by Mr. C. H. HERBERG.

White ground Fancy Carnation.—Betty, exhibited by Messrs. A. B. BROWN, LTD.

Obituary.

GEORGE PATTINGTON. The *National Geographic*, of America, records the death, in May last, of George Pattington, an old established nurseryman in Aurora, N.Y. Mr. Pattington was an Englishman by birth, but emigrated to the States at the age of 17. He died at the age of 82, and leaves two sons to carry on the business.

CHARLES T. DREURY. As we go to press we are informed of the death of Mr. Chas. T. Dreury, V.M.H., on Wednesday last. The funeral will take place to-day (Saturday) at East Avon Cemetery, Horn Lane, Avon, at 3 p.m.

CROPS AND STOCK ON THE HOME FARM.

POULTRY.—SELECTING STOCK BIRDS.

The pullets and cockers should be separated, as they grow so much more sturdily when kept apart. All with crooked breast-bones, ill-coloured legs, wry tails, defective combs, blind eyes and wrong feather markings should be separated from the poked birds.

Now is the time to select birds of both sexes for stock. Pullets hatched at the end of March or early in April can reasonably be expected to lay in the autumn. But even with pullets of that age, very much depends upon the manner in which they are managed. Choice of breed is important, but it is purely a matter for personal choice and local circumstances. One sort is favoured in certain localities, wet or dry; in some other districts the same sort is not appreciated.

I am often asked what is the best breed for egg and table chickens. That is a difficult question to answer, because the best egg-producers are not the best table fowls; in fact, they are usually of the opposite character. For instance, White Leghorn is quite one of the best of egg-producers, but it is of no value as a table chicken.

English Game is probably the finest breed in existence for high table quality, but no one would recommend it purely as an egg-producer. The most easy method of combining the two ideals is to select a general utility breed and manage it well.

An important point, too, is that of strain, pure-bred birds of any sort vary in their laying properties, and the best are selected into strains. Birds of any breed are bred for one of two purposes, either exhibition or utility. Shape, size, comb and feathers are the essentials where exhibition is the aim. Where egg production is the aim the laying habit is the point to consider; the procuring of a good laying strain. This can only be achieved by a close test of the mothers in the previous season; by the aid of what is known as "trapping" a record is kept of the number of eggs each hen lays during a year. A hen producing anything like 200 eggs per year is a good layer, though this number is by no means a maximum. Pullets bred from such mothers are likely to be prolific layers. Whatever breed is decided upon, it should be true. As a guide to the beginner I will name a few desirable utility breeds, pointing out, however, that in the face of a shortage of food it is not wise to keep more than are sufficient for home use. Rhode Island Red is one of the best of utility breeds, laying fairly large brown eggs during the winter, and the brown eggs have a fastination that white eggs do not command. The chickens grow sturdily, and make fair table birds. The feathers are dark red, legs yellow, and comb single or double. Light Sussex lays tinted eggs freely during the winter; it is a good utility bird, feathers white, with neck hackles dark grey. Banded Plymouth Rock still maintains its reputation as a good winter layer; it is hardy, a good forager, and a useful table fowl. Buff Orpington is a much favoured fowl in many districts. It is a layer in July, when so many other breeds have gone off. It is a good table bird, and excellent mother. The feather colour is buff, with white legs.

White Orpingtons are larger than the Buff, and they lay brown eggs during the winter, and make large table fowls, much favoured in the market. White Wyandotte is a popular breed, laying freely rather small, tinted eggs, they are handsome in appearance, mainly of double combs, with deep orange-coloured legs.

Of white egg-producing breeds, White Leg-horn stands high in general estimation, and is probably the best of that type; pure white in feather colour, with a bold arching tail, a large, richly coloured comb, pure white earlobes, deep orange-banded legs, and a bold, upstanding carriage.

A good strain of Black Minorca lays the largest of all eggs; the birds are good for summer egg production, but of little value for table use. These and White Leghorn are not so strong a point in their favour.

Where hens of mixed breeds are kept together, it is wise to cross them with an Indian game bird, as well as birds for egg-producing, as it improves the table qualities.

No doubt the semi-intensive method of keeping fowls for winter egg production has much to recommend it. The hens are kept in a house with a southern aspect and with sufficient space to ensure that during wet or cold weather they need not be exposed; they are kept in the dry, warm quarters with plenty of exercise and judicious feeding of the scrap order. Fowls should not be fed too highly, especially where they are unable to get exercise. *Edwin Molynar.*

ENQUIRY AND REPLY.

I FOLLOWED your advice given last year as regards pruning, and my Peach trees are this year carrying a good crop of fruit. The border contains a lot of suckers. The roots are as thick as one's finger, and nearly on top of the soil. *Beche.*

REPLY.—We are glad to hear that your Peaches are bearing satisfactorily. It is not usual for Peach trees to throw up suckers in the way you describe, though Plums frequently give trouble in this way. In autumn remove the surface soil down to the roots, and cut off each sucker cleanly as near to the root as possible; then apply a top-dressing of fairly rich compost, to a depth of about 2 inches.

ANSWERS TO CORRESPONDENTS.

APPLE LEAVES.—*J. D. N.*—1. There is no fungus present in the leaf spots; in other apparently similar cases pyramida of a species of *Phyllosticta* often occur. The disease does not cause any appreciable injury. No. 2. This kind of "scorching" effect is probably due to soil conditions; a species of fungus (*Cladosporium*) is present, but it is probably living as a saprophyte on the parts already dead, and is not responsible for the injury.

EARLY VEGETABLES UNDER GLASS.—*E. C. B.* Potatoes form one of the most reliable crops for early production. They do well on shallow benches in a greenhouse, where the temperature does not often fall below 40° Fahr. If planted early in January the Potato is safe whilst under ground, even at 35° Fahr. One of the best early planting, plant early in February instead. Dwarf Peas can be sown in shallow benches on January 1, the crop cleared early in May, and Tomatoes planted afterwards. Early Radishes may be planted between the rows of Peas. If the houses are not lofty, Lettuces may be grown; Cammotto Nutt Cabbage Lettuce is one of the best early varieties. Carrots, such as Parisian Early Forcing, may also be grown. Early Vegetable Marrows may well, and could follow the Lettuces and the Carrots. If light can be excluded some early Ribwort might be grown, or possibly it would succeed under the benches. French Beans are too tender a crop to grow under cold treatment. It is not safe to sow them until the end of March in cool houses. Evergreen is a good variety to sow about that time. If there is an abundance of stage room, it is in a large span roofed Carnation house, an early crop of Extra Early Forcing Cabbiflowers may be attempted; they will come in useful early in May. Dwarf Early Cabbage are also a good crop, possibly one of the best where the temperature falls as low as freezing point. Mustard and Cress for salads are but little trouble to grow. Mercury (*Chromolaena Bains Henrietta*), as an early Spinach, is well worth attempting. It will thrive in a cold house, and if sown at once on a sunny border the plants could be lifted in October and put into shallow boxes. Keep them cold through the dark days, and bring them on in a light house towards the end of February. An excellent use for a cold house would be to bring on a crop of early Onions for planting out in early April. Early Lettuce, Cabbages, and Cauli-

flowers could all be raised in shallow boxes to plant on the outside borders in the early spring. Broad Beans scarcely pay as an inside crop, but if raised in pots and planted out early in April they will be in picking as soon as the autumn sown stock. Peas can be raised in pots from the middle of January to the end of the month for planting outside on an early border about the end of March. There are several books which would help you, e.g., *Vegetables for Home Consumption and Pickling*, by E. Beckett, 5s. 6d. post free; *The Vegetable Garden*, by W. Robinson, 15s. 8d. post free; and *The Culture of Vegetables and Flowers from Seeds and Roots*, by Sutton and Sons, 5s. 6d. post free. These can be obtained from our publication department if desired.

FRUIT SHOW: Inquirer. The Royal Horticultural Society's show of fruit will be held on October 2 and 3 this year.

HYDRANGEAS: H. J. D. The plants may be safely wintered in a shed without any further protection, providing that the structure is safe from hard frosts. Moderate frosts should not hurt the plants, as they do well out of doors in many of the warmer counties. Enough water must be given to keep the soil slightly moist. Pruning must be limited to the removal of any old and exhausted wood during the dormant season. The plump terminal buds on the strong shoots will produce the finest heads of blossoms. Iron filings mixed with the soil will cause the flowers to become tinged with blue, but other substances are used for the same purpose. For instance, alum water of a strength of 1 ounce to 2 gallons is recommended by many, while in the *Gardeners' Chronicle* for June 21, 1915, p. 422, mention is made of the success attending watering with iron alum. There are also two preparations which can be obtained from horticultural sundriesmen for the purpose, Azure and Cyanol, both of which are effective. Oxide of iron would doubtless serve the same purpose, but we have had no experience of it. The preparations above referred to are watered in, but the long one would have to be mixed with the soil, and it would therefore be necessary to repot the plants.

NAMES OF PLANTS: J. B. H. 1. *Salvia hians* (Cashmere Sage); 2. *Salvia sylvestris* (Wood Sage); 3. *Veronica virginica* (Great Virginian Speedwell); 4. *Lysimachia celtoides*; 5. *Aralia cordata* (often named *A. edulis*); 6. *Spiraea palmata* alba; 7. *Veronica virginica* (Great Virginian Speedwell); 8. *Apocynum androsaemifolium* (Tutsan leaved Dog's Ban). The white *Veronica* (No. 3) is some times distinguished as *V. virginica* alba, but it is really the original introduction, which now varies with white, flesh, lilac, and blue flowers. **W. B. C.** 1. *Catalpa bignonioides* (Indian Bean); 2. *Clematis heracleifolia* Davidiana; 3. *Sauraea canescens*—*Old Subscriber*. 1. *Resulobis Phytum* spicatum, but flowers are necessary to make sure of the genus; 2. *Swainsona coronillaefolia* (often named *S. Osbornii*); 3. *Cannanula raphanoides*; 4. *Cannanula raphanoides* alba; 5. *Lactuca Filixmas*; 6. *Polypodium aureum*; 7. *Silene pendula*; 1. *M. Magnolia tripetala* (the Umbrella Tree), a native of the United States—*E. D. Dixon*. 1. *Bignonia radicans*; 2. *Desfontainia tomosa*; 3. *Lathyrus salicaria*; 4. *Anthemis tricolora* Kewensis; 5. *Betonica officinalis*—*T. L. Manchester*. 1. *Nephtolepis exaltata* crispata; 2. we do not name varieties of Roses.

PEA ROOTS: H. G. Hatham. The roots of the Peas are attacked by *Thielavia basicola*. The disease is worst in wet and undrained soils, so excessive watering should be avoided. Affected plants should be pulled up and burned as soon as they show symptoms of the disease. Peas should not be grown on the same ground next year.

PLANTS THAT BLOOM AT NIGHT: C. G. A. As far as we have seen or heard, there is no book and no comprehensive article on plants that bloom at night, though there are scattered references to such plants extending over a long period in gardening literature. Some of the most remarkable plants that bloom at night are Amor-

phoballus titianum (syn. Conophallus titianum), *Cereus*, *MacDonaldiae* (Mrs MacDonald's great night-blooming *Cereus*), *Cereus coniformis*, *Cereus grandiflorus*, *Cereus leiodendensis*, and *Cereus nyctoides*. The *Amorpha* is powerfully scented but disagreeable. Many of the species of *Oenothera* (Evening Primrose) open during the early evening and are in perfection all night, including the naturalised British ones, *O. biennis* and *O. Lamarckiana*, both sweetly scented. Several of the species of *Silene* flower at night, including *S. noctolens*, *S. noctiflora*, *S. nocturna*, *S. mutans*, *S. dubia*, *S. vallesia*, and others. The second, fourth, and fifth of these are British. Amongst the *Stocks* *Matthiola tristic* and *M. bicornis* open during the cool of the evening and are sweetly scented. This also applies to the night-scented *Tobacco* (*Nicotiana glauca*, often named *N. affinis*), *Lychnis alba* (syn. *L. vespertina*) flowers best at night and is fragrant then. *Silene nutans* and *S. noctiflora* are also fragrant at night. You can get *Cactaceae* plants from Messrs. G. and A. Clark, Ltd., Dover. In pre-war days you could have got any number of species from Mr. H. N. Ellison, Bull Street, West Bromwich; and from M. Frantz de Laet, Contich, near Antwerp. *Cacti* cuttings and plants were offered recently by Ivanhoe, 7, Hartington Villas, Hove, Sussex, and by Mr. Hollis, Nurseryman, Norwich.

PLUMS SHOWING DISFIGUREMENT: G. B. The disfigurement of the fruit is caused by a Gall Mite (*Eriophyes padii*). It is too late to deal with the pest this season; the trees should be sprayed in winter with the lime-sulphur wash. With regard to the second query, the two Plums were separated when they arrived, and we can find no evidence that they are "twins." One of them is attacked by brown rot (*Monilia cinerea*), and the other Plum appears to have been attacked to it by a pad of fungal hyphae; this frequently happens when a healthy Plum is touching a diseased one. The disease would have soon attacked the healthy Plum through the point of contact.

POTATOS: W. T. W. The Potatoes are affected by common scab (*Osposora scabies*). As a rule, the disease does little harm, with the exception of disfiguring the tubers. The application of lime to the soil should be avoided, as the organism causing the disease is said to thrive in alkaline soils. The use of superphosphate and sulphate of ammonia is recommended to counteract the alkalinity. Certain varieties of Potato, such as "Golden Wonder" and "What's Wanted," are resistant to this disease, and should be given a trial on soil where the disease is prevalent. If *W. T. W.* The Potatoes are affected by the corky scab disease (*Spongospora scabies*). Diseased tubers should not be used as "seed." If possible, avoid planting Potatoes on the infected ground for at least three years.

PLOUGHING PASTURE FOR OATS AND WHEAT: C. H. To prepare for Oats, closely graze the grass until it is time to plough, so that there will be but little sward to encourage wire-worm. If the land is fairly dry, and the weather is suitable, ploughing may be done at the end of February or early in March. In opening the first two furrows with the plough, spread the turf over the land so that the next furrows can be effectively buried without raising too high a ridge. Plough the land in narrow furrows about 5 inches deep, with the skim (collar) affixed to the plough, to ensure the turf being thoroughly buried. Make each furrow firm with a heavy presser. Directly the ploughing is completed and the weather is dry, sow broadcast Black Tartarian Oats weighing not less than 40 lbs. per bushel at the rate of four bushels per acre. Harrow once, then sow 4 cwt. of agricultural salt, 3 cwt. of superphosphate, and 1 cwt. of sulphate of ammonia per acre over the surface. Then harrow many times, certainly not fewer than six, making the surface quite firm, but not enough to cause a callus. The artificial manure sown as directed accelerates the growth of the Oats so much that they grow out of the way of wireworm, which does not

injure cereal crops after the second leaf is formed. When the Oats are well through the soil choose a dry day, and thoroughly roll the plot, making the soil firm about the roots of the Oat plant. Should any Oat plants when 3 inches high exhibit signs of wireworm attack, sow 1 cwt. of sulphate of ammonia per acre as a further fillip to growth. Wheat: Early in October plough in a similar manner as advised for the Oats, and sow broadcast 3 cwt. of superphosphate per acre and 3 bushels of Red Standard Wheat, of clean, plump seed. Harrow at least four times, if light soil six times. In February sow sulphate of ammonia at the rate of 1 cwt. per acre. At the end of March or early in April, according to the weather, draw iron harrows across the furrows, loosening the soil about the plants and admitting air to the roots. Make the plot quite firm with a heavy ring roller, which should be used in fine weather.

THE GATHERING OF PEACHES: Miss P. Peaches should not be gathered before they are ripe as the flavour is never so good as when the ripening takes place upon the tree. In a soft, tender fruit like the Peach or Nectarine, there is, of course, a certain amount of danger in allowing them to ripen on the tree, as they may fall to the ground between the gatherings. For this reason many gardeners use nets which are so fixed that should the fruit fall no damage is done to it. Practice, however, enables the fruit-grower to arrange his times of gathering and so to judge the condition of each fruit that, whilst leaving the fruits upon the tree as long as necessary, at the same time he runs very little risk of losing them through injury from falling. If he is not quite sure that a fruit is ripe, though having reason to think it is near that stage, he places his thumb and fingers on the base of the fruit near the stem, and very gently feels if the flesh of the Peach is soft in that particular place; if it is, and the fruit parts readily from the stem when handled, he has no further doubt that it is ready for picking. Peaches and Nectarines intended for packing for long journeys, may have to be gathered at least 24 hours earlier than would be necessary were they to be consumed in the establishment where they are grown.

TOMATOS WITH HARD PATCHES: J. K. The Tomatos are not diseased, but are suffering from want of potash in the soil. Apply sulphate of potash to the roots, or, if unobtainable, a generous quantity of burnt wood ash.

TOMATOS: W. L. M., Abuss. We cannot find any pathogenic organism on the Tomatos; the only fungus present is a saprophyte (*Penicillium* sp.), which would not account for the trouble. May we assume that the spray fluids used were sufficiently diluted?

VINES AND PEACHES: Ignorance. You appear to be managing your vine very well as regards ventilation, and, as you are obliged to leave early, it is best to allow a little air to remain on at the top during the night when the weather is warm. If the house is in a hot position, it may be damped in the early part of a warm day, and occasionally in the middle of the day when there is bright sunshine, but never after closing, and the surface of the border, if it is inside, should not be made so wet as to become adhesive. Peaches do not require so high a temperature as vines; the house should be opened as widely as possible on a hot day, and during the ripening stage should never be entirely closed.

VIOLET PODODED CLIMBING FRENCH BEAN: F. Liddard. The Kidney Bean you send is Haricot à Cosse Violette, that is, Violet podded Haricot. The recorded English names for it are Purple-podded Bean and King Theodor Runner Kidney Bean. The pods are stringless, and are said to boil green like other varieties.

MARKETS.

COVENT GARDEN, LONDON.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—Eds.

Table with columns: Plants in Pots, s.d. s.d. Average Wholesale Prices, Ferns, con., s.d. s.d. Includes items like Aralia Sieboldii, Asparagus plumosus, Begonia rex, etc.

REMARKS.—This is a quiet time in the department, there being practically no flowering plants to offer. The market will be very dull for the next few months. The sale of cut flowers will be brisk for the next few months.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and foliage with prices. Includes Aster, Carnation, Calla, Chrysanthemum, etc.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and ferns with prices. Includes Adiantum, Asparagus, Liliolum, etc.

REMARKS.—The heavy rains during the whole of last week, and the cold, damp, and foggy weather of the present week, have done much to reduce the supply of cut flowers and foliage.

the present season, and a considerable quantity remained unsold. The supply of the standard White and Coloured Azaleas, which are sold in 5s. to 10s. per dozen bunches, is still plentiful, and in other kinds flowers are much more plentiful than in the previous season. There was a good sale of prices throughout the market for all grades. The prices of Liliolum longiflorum are very low, and prices for per dozen, Liliolum longiflorum are only of medium quality, and the best are difficult to find. Sibthorpe's (London) Gladiolus (Holland) and smaller Broomheads are still in the market, and a few bunches of Montebello are on offer. There is an abundant supply of white Heather, and 712 bunches are available at 1s.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices. Includes Artichokes, Beans, Broad, Carrots, Cabbages, etc.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices. Includes Apples, Apricots, Cherries, Currants, Dates, Figs, Grapes, etc.

There is a good supply of the standard White and Coloured Azaleas, which are sold in 5s. to 10s. per dozen bunches. The market is quiet for the present, and the supply of cut flowers and foliage is very limited. The prices of Liliolum longiflorum are very low, and prices for per dozen, Liliolum longiflorum are only of medium quality, and the best are difficult to find.

ROYAL GARDENERS' ORPHAN FUND

B. WYNNE, Sec., 10, Bedford Chambers, Covent Garden, London, W.C.

The Tropical Agriculturist

[First issued in 1887 by the late Mr. John Ferguson, C.M.G.]

Journal of the Ceylon Agricultural Society.

PUBLISHED MONTHLY.

Editor: The Director of Agriculture, Ceylon.
Assistant Editor: The Secretary, Agricultural Society, Ceylon.

Subscription on Ceylon—Rs. 10 per annum; Foreign—£1, Rs. 12, or \$5 per annum, post free.

The Tropical Agriculturist occupies the leading place among British journals dealing with tropical agriculture. Articles on all branches of the tropical agricultural industries are included. Special reference is given to tea, rubber, coconuts, rice, and other products of Ceylon, and extracts from other agricultural journals and magazines are included. Important articles are given on the cooperative credit society movement.

CIRCULATION.

Europe: Belgium, France, Holland, Italy, Norway, Portugal, Russia, Spain, Switzerland, United Kingdom.
Asia—Andaman and Nicobar Islands, Asoe Islands, Brunei, Java, Malaya States, Philippine Islands, Sarawak, Siam, Straits Settlements, Sumatra, Tonquin, Cochinchina.
Africa: Central Africa, E. East Africa, E. West Africa, Egypt, Italian Somaliland, Madagascar, Mauritius, Portuguese E. Africa, Seychelles, Union of South Africa, Zulu, Zululand, Zulu.
America—Brazil, Canada, Cuba, Costa Rica, Guatemala, Mexico, Nicaragua, Panama, Peru, United States, Venezuela, West Indies.
Australia, Bismark Archipelago, Cook Islands, New Hebrides, New South Wales, New Zealand, Queensland, Solomon Islands, Tasmania, Victoria, West Australia, New Guinea, Oceania, New Caledonia, South Africa.

THE

Vegetable Garden.

This is an English translation, made by Mr. W. Robinson, of the celebrated work by the world-famous growers,

MESSRS. VILMORIN, ANDRIEU & CO.,

of Paris. There are no market growers to equal the French, and in this work English readers will find placed at their disposal, in readable and interesting form, all the experience and knowledge of centuries of successful cultivation. All the principal vegetables, including many which are at present unfamiliar to English growers, are fully dealt with; and numerous clear and informative illustrations give point to the instructions contained in the text.

EVERY FOOD PRODUCER

should obtain a copy of this book, which will enable him to get the very best results out of the ground at his disposal.

PRICE 15s. 7d. POST FREE.

From THE LIBRARIAN, 41, WELLINGTON ST., STRAND, W.C. 2.

A TREASURY OF INFORMATION

is contained in the

HORTICULTURAL DIRECTORY AND YEAR BOOK.

Nowhere else can the gardener obtain, within the small compass of four hundred pages, so much information on the subjects which interest him most. The knowledge which this little work contains is just what is indispensable to the gardener in his daily life. The

CALENDAR OF GARDEN OPERATIONS

takes him through the whole year, reminding him of the manifold small cares which make all the difference between health and ill-health in his plants. It also reminds him of the exhibitions which are to be held and of the most important annual meetings.

Another interesting section, which expands each year, is the list of

SCHOOLS OF HORTICULTURE.

with a brief description attached to the name of each such institution. Those concerned with the education of young gardeners—both men and women—will turn to this section with especial interest, and those who are seeking such education will find it of the greatest assistance in deciding which school to select. There are still for sale a few copies of the current edition.

EVERY SUCCESSFUL BUSINESS MAN who is engaged in any branch of the trade, and who is desirous of increasing his profits, should have recourse to the "GARDENERS' CHRONICLE" for the information it affords. The paper contains the prices of all the principal articles of the trade, and other articles of interest to the business man. It also contains the names of the principal firms in the trade, and the names of the principal agents in the trade. It is a most valuable and interesting paper, and is well worth a trial. Write for a copy to the Editor, "GARDENERS' CHRONICLE," 41, Wellington Street, Covent Garden, London, W.C. 2.

APOLOGY.

Sawbridgeworth, August 8, 1917
DEAR SIR, In reply to your letter of the 7th inst., I make you a full apology for sending train to your boys to another schoolman. As they were boys in which I had purchased from my petal shop, I was unaware that I was infringing your Trade Mark by returning them to you. I am Yours truly, (signed) H. ROCHESTER, Messrs. Geo. Munro, Ltd., (Over it Garden Market).

MISCELLANEOUS.

SPORTSMEN, Farmers, Horsemen, try our splendid Yorkshire Whipped Tweed; wears like leather; showerproof; 7 yards for 17s. 6d., Pattison Bros., BEAUFIELD WOOLLEN CO., 71, Bradford.

BUSINESS METHODS.—Experience in the world of commerce shows that there are two ways of conducting a business: the one being to charge as much as possible for what is sold, exacting a high rate from one customer and a low price from another, and the other to have a fixed price for everything and stick to it. The first method is to be condemned from every point of view, but mainly because it punishes the best purchasers, those who are ready to pay what is reasonably asked when the goods are marked in plain figures. The *Gardeners' Chronicle* adopts the alternative. It guarantees that its advertisement rates are not altered for any customer, big or little, old or new; all pay the same price for a similar thing. Consequently, while it is not possible to grant concessions, it is nevertheless the privilege of the paper to be in the position to assure each advertiser that he pays no more than anyone else.

SITUATIONS VACANT.

Four Lines 3s. (Head-line counted as Two), 6d. for each succeeding line.

PRIVATE.

WANTED, HEAD GARDENER (WORKING) for North Lincolnshire, age not under 34, must have large experience of glass and outside Garden work, wages £250 per annum and good bonus. Reply, in first instance, with references, to T. W. H., Box 15, 41, Wellington Street, Covent Garden, W.C. 2.

NOTES FROM A GALLOWAY GARDEN.—IX.*

THE clan of bell-flowers hold high festival in July, and there is no more generous race; but some of them are turbulent subjects. Although I had secured a treasure when, some twenty years ago, I bore away from Belyour Castle some seedlings of *Campanula latifolia*. It is indeed a fine thing, with its splendid panicles, whether these be the colour of skimmed milk or a hyacinth blue, but it is a dread tyrant in the borders, scattering seeds by the bushel, and driving its fanged roots a yard deep in the soil. The woodland, not the garden, is the right place for it, where it may settle accounts with our stately native, *C. latifolia*. Of the latter there is a charming border variety named *Van Houttei*, half the height of the type and very attractive when its dark maroon buds open to pale lavender bells. Among the newer sorts of *Campanulaceae*, *Adenophora megalantha* deserves favourable notice. Of neat, firm habit, with stems 12 to 15 inches high, it bears on each at the end of July six or eight bells of a clear shade of light blue, and continues a long time in bloom.

Another member of the Bellflower order, the Himalayan *Cyananthus lobatus*, is seldom to be seen happy in lowland gardens. The finest mass of it that I have met with grows on the flat in granite soil in Sir John Stirling Maxwell's Highland shooting-box at Corour, 1,250 feet above the sea, where the rainfall is excessive and there is much snow in winter. We have tried it many times here and failed, except with one plant, growing high and dry on a ledge of a retaining wall. Here it flourishes and gives us many shining blue-flowers, bearing a specious resemblance to some of the summer-flowering *Gentians*. We blamed winter wet for the loss of several plants, that being indicated by

* Previous articles appeared in the issues for Jan. 25, Feb. 17, Mar. 10, April 14, April 28, June 2, June 29, and July 21, 1917.

Mr. W. A. Clark in *Alpin Plants* as the cause of the mischance; but we do not get half the rain here that they endure at Corour.

Henry's St. John's-wort (*Hypericum patulum* Henry) is a decided acquisition, but we cannot afford to let it supplant the original type. It comes into bloom a month earlier than the older plant, and its flowers are of a deep purplish red, "red gold" of the old ballad. It is as profuse in blossom as can be, but it is half over before the other begins. It has now (July 30) been in beauty for a fortnight, and it will be another ten days or so before its rival opens a flower; but the latter will go on blossoming till stopped by autumn frost. Last year the mercury never fell below freezing-point till Christmas, and *H. patulum* remained a beautiful object right through November. Mr. Bean describes it as a dwarf shrub, "but said to grow as much as 6 feet high in Japan and the Himalayas." When I read that I went out and measured the nearest of many large plants here, and found it was just 5 feet high and 16 feet in circumference. Some of the plants were cut by last winter's frost; others escaped scot free. It sows itself freely in the borders, and it will be well if *Henryi* follows suit, for it is said that, being harder than the type, it can be grown where *H. patulum* is cut to the ground each winter. The handsomest of all the shrubby St. John's-worts is *H. Hookerianum*, for its thick golden petals have a satiny gloss that gives them a peculiar charm. It is impatient of drought and scorching heat; such plants as I have seen in the southern counties of England had grown very leggy, with sparse foliage and small flowers; but no doubt it would respond to such conditions as suit *Tropaeolum speciosum*, viz., a moist, peaty border shaded from fierce sunshine. It ripens seed freely, and may also be grown from cuttings; it fully repays patience in bringing it to perfection.

Life having been for me one prolonged defensive strife against rabbits, I thought that I had gauged their dig-stroke functions sufficiently to compile a list of plants that they would *not* eat; but one lives to learn. When visiting lately the quaint and interesting garden of Mr. Agnew Wallace, of Loch-on, I noticed that in the woods near the house several species of *Alstroemeria* flourished unharmed and were very ornamental. As these woods abound in rabbits and roe deer, the hint was not to be neglected, for in these days of scant labour it is impossible to keep this rampant spreader from overrunning better things. So out it shall all go, to bear company with *Monarda*, *Antholyza paniculata*, and *Funkia*, all of which are quite rabbit proof, for some occult reason, and have long been naturalised in our woods.

The most brilliant August-flowering shrub is *Desfontainia spinosa*, now in full bloom, covered with scarlet and yellow tubes, contrasting well with the dark, glossy foliage, which is so good an imitation of the holly. Although this fine bush simply revels in the climate of the West Coast, it is not always seen in vigorous com-

dition, owing to being put on too meagre a diet. It has a hearty appetite, and old plants are apt to get hollow in the centre unless liberally treated. A large bush here, having stood for five and thirty years without any attention, had exhausted the soil in what was originally a rich border and showed symptoms of going back. Two years ago, therefore, we gave it a heavy mulch of peat, sand, and wood ashes. It responded gratefully, and is now as fresh and floriferous as one could wish.

British gardeners and amateurs do not, as a rule, give annuals a fair chance. It is a common practice to sow them in patches and leave them unthinned, to jostle each other into a most debilitated caricature of what they become if given room to develop. Some people are incredulous when they are told that the way to get the best out of, for instance, *Nemophila insignis* is to thin the seedlings out until each has at least half a square yard of space to itself. Nevertheless, unless this is done, one can never enjoy at its best what is really one of the prettiest flowers in existence. Last spring we had to cut down a *Thujopsis dolabrata* 35 feet high in order to clear a fine bush of *Rhododendron cinnabarinum*. No labour was at command to take out the massive stump; the soil under the dense foliage was bone-dry and matted with roots, so to conceal the scar, 6 inches of loam, peat and sand was spread over it and sown with several varieties of *Leposiphon*, the seedlings being well thinned out when they were big enough. The effect now on a sunny day is quite charming; the multitude of gay little blossoms rose-coloured, lavender, orange, yellow and white, having the appearance of delicate jewellery.

When walking one morning along a solitary part of the sea-beach, with not a human dwelling within sight, my eye was attracted from a distance by some showy white blossoms. On approaching them, I found that they belonged to a stray plant of *Rosa rugosa* which had found its way thither and had spread far and wide along a sandy bank. Never before have I seen this *Rose* to such advantage, for it is far too coarse and rampant for the garden, although it grows and flowers well in our woodlands. Here, however, established on pure sea-sand and exposed to blazing sunshine, its over-luxuriance curbed by salt-laden winds, it has acquired a character vastly superior to that which it displays under cultivation. It shall be my care to give it a red-flowering companion before winter. The bank on which this *Rose* grows is thickly carpeted with *Convolvulus soldanella*, whose of the lovely rose-tinted vases have lured many amateurs to the unprofitable task of transporting it to their gardens; wherein, even if it flourishes, which it seldom does, it suffers in grace by divorce from its natural environment of dry, wiry grass. We in the North and West have escaped the deluge with which English gardeners and farmers have been afflicted. June and July have been months of continuous sunshine, with only two days of heavy wet to keep things luxuriant. *Herbert Maxwell, Monreith.*

NEW PLANTS.

NOLINA LODERI. N. E. BROWN

A PHOTOGRAPH (see fig. 24) and specimens of this novelty have been kindly sent to us by Sir Edmund Loder, of Leonardslee, Horsham, with the information that he received it some years ago from a nurseryman at Genoa under the erroneous name of *Dasylyron Bigelowii*. It was subsequently determined by a German botanist to be *Nolina crumpeus*, a name that is equally erroneous, for it bears very little resemblance to either of those species, and upon comparison with the material in the Kew Herbarium and the descriptions of the few

above the sheathing base, thence gradually tapering to the quickly withering recurved fibrous apex; basal sheath $1\frac{1}{4}$ inch (3.33 cm.) in breadth, gradually (not in the least abruptly) tapering into the leaf, flat on the face; blade about 1 line (2 mm.) thick, shallowly concave above, convex beneath, having on both sides a slightly raised line down the centre and another near one margin marked with minute pits, causing these lines to feel slightly scabrid to the touch, becoming evanescent towards the apex and base; margins minutely serrulate-scabrid. Flower stem about 6 feet (2 m.) high, stout, with the panicle part about $3\frac{1}{2}$ feet (1.7 m.) long and 5.7 inches (13.18 cm.) in diameter, entirely glabrous; bracts withering and falling away.

$1\frac{1}{2}$ line (3.3 mm.) long and rather less in diameter, oblong or globose-oblong, very obtuse. Perianth-segments of the male flowers $1\frac{1}{2}$ line (3.3 mm.) long, 1 line (2 mm.) broad, oblong, obtuse, reflexed, white. Stamens shorter than the perianth segments; filaments filiform, about $\frac{3}{4}$ line (1.5 mm.) long, white. Anthers 1 line (2 mm.) long, oblong, yellow. Ovary rudimentary, 3 lobed, white. Female flowers not seen.

Sir Edmund Loder states that the "whole effect of the flower-spike was decidedly yellow." This would probably be produced by the prominence of the yellow anthers, as the perianth segments appear to have been white when fresh, but, being revolute, would be partly concealed by the anthers.

The native habitat of the plant is not known, but the fact that Sir Edmund Loder states that it has been growing in the open air at Leonardslee without protection for nearly twenty years would seem to indicate that it probably grows on mountains at a considerable elevation, either in Central America or the south-western part of the United States. The size of the leaves, their very gradual taper above the sheath, the very long bracts, the small divergence of the branches and the branchlets of the panicle, the lax manner in which the branches are branched, and the oblong buds, seem to be the chief features which characterise this species and distinguish it from all others. The drawing of the base of the leaf (see fig. 25) was made by running a pencil around the margin, so that it quite accurately represents the very gradual taper from sheath to blade. N. E. Brown.

FIG. 24. NOLINA LODERI.

species not represented therein it seems to be very distinct from any species at present described. Although the existing descriptions are very poor, giving no details upon which a critical comparison can be based, yet in the characters given for the leaves and pedicels of those species not represented at Kew, they differ so widely from Sir Edmund Loder's plant that I think there can be no doubt as to its being an undescribed species, of which the following is a description:—

Plant stemless, the growths forming a large, dense clump. Leaves erect or ascending, hard and somewhat stiff, green on both sides, not at all glaucous, finely striate; $3\frac{1}{4}$ feet (1.46-1.62 m.) long, 6.7 lines (12-14 mm.) broad at a little

the lower 18-20 inches (45-50 cm.) long, 1- $1\frac{1}{4}$ inch (2.5-3.5 cm.) broad at the base, thence gradually tapering to a very long, slender blunt point, the upper shorter; branches diverging from the stem at an angle of 30-40°, ascending or suberect, 7-10 inches (18-26 cm.) long, laxly branched, with the branchlets 2-3 inches (5-7.5 cm.) long, diverging at the same angle as the branches, simple, arranged in 3-4 somewhat whorled groups, with one on each side at the very base. Bracteoles membranous, white, broadly ovate, acute or subacute, lobed at the margins, very concave, forming little oblique cups about 2- $2\frac{1}{2}$ lines (4-5 mm.) long. Pedicels not exceeding the bracteoles, about 1 line (2 mm.) long, jointed near the middle. Buds about

ORCHID NOTES AND CLEANINGS.

CATTLEYA LADY CARLILE.

This is a pretty, new *Cattleya*, raised in the gardens of Frederick J. Hanbury, Esq., Brockhurst, East Grimstead, between *C. dolosa* and *C. Mantinii* (*Bowlingiana* × *Dowiana aurea*). The flower is equal to *C. Mantinii* in size, but the colour of *C. Bowlingiana* in that hybrid blended with the rose purple of *C. dolosa* predominates; *C. Dowiana aurea* can scarcely be traced. The sepals and petals are bright purplish rose; the openly displayed lip is rose-coloured at the base, the front ruby purple, and the disc yellow.

DENDROBIUM AURANTIACUM.

This rare and distinct species is now flowering with H. J. Elwes, Esq., who showed a cut spike at the Royal Horticultural Society's meeting on July 31. It is of the *D. clavatum* section, the inflorescence bearing from one to three golden-yellow flowers, comparable to that species but without the dark blotch on the lip. It was first described by Reichenbach in the *Gardeners' Chronicle*, July 23, 1867, p. 98. The year following, plants of an importation from Assam were named *D. chrysseum* (Rolfé, in *Gard. Chron.*, Feb. 25, p. 235). It appears to be widely distributed in India. It flowered with Sir Frank Crisp, Bart., as recorded in the *Gardeners' Chronicle*, July 1, 1911, p. 422.

LAELIO-CATTLEYA GLAUCUS.

A TWO FLOWERED inflorescence of the original form of this richly coloured hybrid between *Laelia purpurata* and *Laelio-Cattleya Rubens*, which secured a First-class Certificate at the Royal Horticultural Society's meeting on August 13, 1912, is sent by Mr. Alexander, from the collection of Lt Col. Sir Geo. L. Holford, K.C.V.O., Westonbirt, Tetbury. The flowers are over 6 inches across, and the petals 2 inches wide. Both sepals and petals are of dark mauve colour, finely netted and veined with a darker reddish-purple tint. The broad, finely crimped lip is reddish maroon, and a yellow flush extends from the base to the centre.

ODONTOGLOSSUM CHIRIQUENSE REICHB.

A FINE specimen of this rare *Odontoglossum*, which is often called *O. coronarium* chiriqueense in gardens, is flowering in the collection of Sir Jeremiah Colman, Bart., where it thrives well. It is the best of the *O. coronarium* section, one of the many flowers on the plant sent measuring 3 inches across. The sepals and petals are pale yellow, barred and blotched with chestnut brown. The lip, which has two ascending auricles at the base, is pale yellow, with red markings in front of the crest. The column, which has two broad truncate wings, is white, marked with claret-red.

THE MARKET FRUIT GARDEN.

EXCESSIVE GROWTH IN JULY.

DURING the greater part of July the weather was sunny and warm, while there were many hot days. Showers or storms of rain were sufficiently inter-spaced to keep things growing, including weeds. Rain fell on eleven days at my station, making a total of 2.57 inches, a fair average for July, which is usually one of the wettest months of the year. Warmth, with the abundant supply of moisture, however, has caused an extraordinary growth in vegetables, flowers, and fruit trees. Steps will be taken to pick Scarlet Runners, where they have not been topped; Broccoli plants are already gigantic specimens, while Potato haulm is rampant. As to weeds, never has it been more difficult to keep fruit plantations in a clean condition. Three weeks after a thorough hoeing they have again covered themselves with weeds, and, where a horse cultivator cannot be used, frequent hand hoeing is necessary. Women at half-acre on a day, working from 3 a.m. till 5 p.m., make complete hoeing, where there are currants among the trees, cost about £1 per acre. It has been a comfort to have a considerable acreage in Lucerne, but the cutting of the crop occupied men and boys much longer than was expected, as the first growth did not stand well against the swap-hooks, so that the tools required frequent sharpening. The cut crop makes quite a thick layer of mulch where it grew well, and a thicker one may be expected to result from the second cutting.

WINDFALLS.

On two occasions in July we had strong and gusty winds, which blew many Apples and Plums off the trees. Fortunately the ground was soft, so that the Apples were bruised only when they hit branches in falling. If it had been hard, the Lucerne stubble and the mulch on it would have afforded protection. It is tiresome, however, to have to send a miscellaneous lot of Apples to market, and when windfalls are abundant they have a bad effect upon the prices of early gathered fruit.

THE NICOTINE QUESTION AGAIN.

Information from the Board of Agriculture is to the effect that I was mistaken in stating on a former occasion that nicotine is cheaper in the United States than it is in this country. It ought to be cheaper, because tobacco is so. But it appears that nicotine is made in this country from tobacco dust out of bond, and that a rebate of duty can be obtained by a manufacturer as soon as he proves that the material has been denatured so that it cannot be used for smoking. Also I am informed that there is no duty on 97 per cent. nicotine imported. The process of extraction, it appears, is expensive, mainly from the dearness of the ether used in the process. Efforts have been made by the Horticultural Branch of the Board of Agriculture to induce one or more of our colonies or dependencies to supply us with nicotine, but

hitherto without success. Difficulty in getting the requisite machinery and chemicals is cited as an obstacle, but surely this should not be regarded as insuperable. In the meantime the Excise authorities might be required by the Government to relax their restrictions against fruit-growers who desire to grow a patch of tobacco for spraying purposes. It appears that they will give a permit for the growing of one perch, but this would not be a tenth part of the area necessary to a grower who wished to make tobacco-wash sufficient for a large acreage. For any greater area the restrictions must be regarded as prohibitory, as they include entering into a bond for a considerable sum of money, the erection of special buildings, the keeping of elaborate accounts, and the admission of an excise-man at any time to examine everything. Another alternative would be that of allowing and facilitating the obtaining of tobacco-powder by a fruit grower out of bond, with easy arrangements as to its denaturing, and a fine on conviction of allowing any of the tobacco to go off his farm. But a supply of nicotine at a moderate price would

FIG. 25. SOLINA LODERI.

A. Stem and base of a leaf of about 1/2 inch.
B. Enlarged fruit of 3/4 diameter.
(See p. 66.)

be far preferable to any other arrangement, and as this is of great importance in relation to the fruit supply of the nation, Parliamentary action to secure that advantage might well be taken. Presumably the manufacture of nicotine is in only a few hands, and therefore not subject to much competition. Under such circumstances it may be that the price charged for it is much higher than is necessary to allow a moderate profit on the manufacture.

POTATO DISEASE.

This disease appeared in spots on the haulm of a small patch of Eclipse and British Queen in a damp situation on July 24. The Eclipse were taken up and marketed at once, while the haulm was cut off the plants of British Queen, leaving the tubers to ripen for a week or two. I grow Potatoes now only for home consumption, except that, in order to ensure an ample supply, there is always a little surplus for sale. When second earlies were grown extensively for sale spraying was done for some years, but was discontinued when it was found that the crop was raised before the dis-

ease had penetrated to the tubers to any extent worth notice. The conclusion was that spraying did not pay for first earlies or for second earlies to be taken up in the first and second weeks of August in my forward district. For late crops spraying is certainly advantageous, but the only late variety grown by me now is Arran Chief, which hitherto has been almost entirely immune from disease. *Southern Grower.*

THE CHINESE TEA PLANT.

CULTIVATION IN THE BRITISH ISLES.

THERE are two chief forms of the Tea plant (*Camellia theifera* Dyer)—the China Tea plant and the Assam Tea plant. The former is a shrub three feet high on an average, but occasionally eight to ten feet. The Assam Tea plant grows to be a small tree twenty feet high or more, and is much less hardy, only growing in the open air in England in places on the south and south-east coast, like Abbotsbury (Dorset).

I need, then, only speak of the Chinese form which is cultivated in China and in Japan, being imported long ago into the latter country from China. This is hardy in mild districts of England and Ireland. In China it is scarcely cultivated further north than latitude 31°, but in Japan it is cultivated to latitude 16°, where the thermometer often sinks to 16° Fahr.

For some reason or another, the Tea plant is extremely rare in Great Britain and Ireland. In 1915, the Dutch botanist, C. P. Cohen Stuart, who had been making a study of all the different varieties of the Tea plant in the Tea Experimental Station in Java, addressed to me certain queries; and I tried at the time to obtain specimens from living Tea plants throughout this country, and I could only find the following examples:—

Kew Gardens.—No plant now in the open air, and only one living Tea plant, not very healthy, which may be seen in the Himalayan House. It is the Chinese form. Mr. Lynch, of Cambridge, says that many years ago there was a Tea plant growing out of doors at Kew, on the wall of the Economic House.

Cambridge Botanic Garden. A small plant, a graft of the Kew specimen.

Glasnevin.—Only one small plant, Chinese form, in a pot indoors. Not thriving.

Abbotsbury (Dorset). Both the Assam and Chinese forms, growing out of doors; but the former suffers from frost.

Leonardslee (Sussex). Three plants, all of the Chinese form, which have been out of doors for a good many years.

Enys (Cornwall). A Tea plant is reported to be growing here in the open.

Restormel (Down). Two very small plants, not very thriving; Chinese form.

Kilnacouragh (Wicklow). A shrub, Chinese form, many years old, about three feet high and nine feet in circumference. It has never suffered from frost, but so far as is known has never borne flowers.

It is very remarkable how rare this interesting and valuable plant is in our botanic and private gardens. I have not been able to discover any other living plants, except one in a private garden in Berkshire. Needless to say, the Tea plant has never been cultivated on a commercial scale in these islands. Mr. Lynch tells me that the Tea plant is peculiar, as it invariably dies in a few years if grown in a pot, and he suggests that its roots need some special substance (bacteria?) in order to thrive. I suppose, however, that the unhealthiness of some cultivated Tea plants is due to unsuitable grafting on another species of *Camellia*.

* Lindley, in *Gard. Chron.*, 1856, p. 328, says that the Assam Tea plant is hardy in England, but this has not been borne out by experience.

† See C. P. Cohen Stuart, *Embarkedende Onderzoekingen ten Betreffe Van de Salafte des Theedant.*, 328 pp., 47 figs., 5 plates, 2 maps. (Amsterdam: J. H. de Bussy, 1916.)

There is an excellent account of the different varieties and of the manufacture of Tea by Sir George Watt in *Journal of the Royal Horticultural Society*, Vol. XXXII. (June, 1907), pp. 64-96.

The Chinese form is a pretty evergreen shrub, producing white flowers in winter and spring, like the common *Camellia* in that respect. It is propagated in China by seeds which are ripe in October, when they are gathered, and are then kept mixed with damp sand or earth till spring. The seeds are taken out of the sand and sown in March. The young plants are transplanted when a year old, and the first crop of leaves is plucked when the plants are three years old. The finest Tea, so far as my experience in China goes, is grown in poor granite soil in hilly or mountainous districts. Indian trees are grown in rich soils; they have much more tannin in their leaves, and are not as fragrant as the Chinese trees which are grown on poor soil. I have found out that, whether owing to the mode of preparation or to an inherent difference in the leaves, Assam Tea causes in some people a distressing complaint, known as preordinal anxiety, which is never occasioned by Chinese Tea.

China Tea could be grown as a crop in sheltered positions in the milder districts of England and Ireland, and if this is tried it would be preferable to have seeds from the most northerly parts of China where it is cultivated, as around Ningpo, Kinkiang, and Ichang. Seeds also might be procured from Japan. Seeds of *Thea viridis*, the Chinese form, were advertised in 1914 by the Yokohama Nursery Company.

Living Tea plants are advertised by some nurserymen in England, but as these are apt to be grafted, I do not recommend them unless a guarantee is given that the plants are really seedlings. The Yokohama Nursery Company also advertises living Tea plants, but these can not be imported at present. *J. Hogg*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See also Tables in *Gardeners' Chronicle* for July 23.)

(Continued from p. 62.)

4.—SHROUDLAND COUNTIES.

LEICESTERSHIRE. — This is not a favoured locality so far as fruit growing is concerned, as we suffer from high winds and late frosts. We did not have to contend with the frosts this season, however, so that crops all round are apparently well up to the average, both in quantity and quality. Out-door Peaches are making quite a good show. The soil is mostly clayey loam, resting in some places on clay and in others on rock. *A. Shukelton, Burrough Hill Gardens, Milton Mowbray.*

— Apples, after showing plentiful blossom, suffered from severe frost on the morning of May 7. I registered 8°, and in some parts as much as 12° was registered. My Apples show that it was the protected blossoms which are yielding fruit. *F. Paterson, Switland Hall Gardens, Loughborough.*

— The crops of Apples, Pears and Plums are much below our anticipation after the wealth of bloom on the trees in the spring. Of Apples, Bramley's Seedling, Newton Wonder, Lane's Prince Albert, Seaton House, and Stirling Castle are the most prolific. Orchard standards of Pears and Plums are disappointing. Wall trees are more satisfactory, although the crop is not abundant. Strawberries were a good crop, but the season was soon over. Givon's Late Prolific and Laxton's Latest were the most valuable. All small fruits are heavy and clean crops. Peaches are carrying excellent crops, and the trees are clean and healthy, and free from aphid and blister, although we had much cold wind from the N. E. and East during the spring

months. *Daniel Roberts, Prestwold Gardens, Loughborough.*

NORTHAMPTONSHIRE. — The Apple crop has not come up to expectations. The blossom was abundant, but weak. On trees where the blossom was stronger we have good crops. Caterpillars were plentiful, but the sparrows have helped to clear these off. *Alfred Child, Cudshy Gardens, Daventry.*

— We are very disappointed with the Apple, Pear, and Plum crops at Althorp, as there was such a wonderful show of blossom, but the Apple and Pear trees were stripped of foliage and bloom by caterpillars. The shortage of Plums is no doubt due to the absence of bees, which have been killed in this neighbourhood by the Isle of Wight Disease. *C. F. Crump, Althorp Park, Northampton.*

— The fruit crops in this district, generally speaking, are very good, especially Apples, Pears, Peaches, Nectarines, and bush fruits. Our soil is a light loam, overlying ironstone, and in a hot dry season the fruit crops are apt to fail unless artificial watering and mulching are resorted to. We have been fortunate this season in having local thunderstorms with heavy rains just when required, and all crops look promising. Cherries do not succeed in this locality. *John Meager, Harwooden Hall Gardens, Wellingborough, Northants.*

NOTTINGHAMSHIRE. The fruit crops this season are the most favourable we have had for a number of years, especially Apples, Pears, and small fruits. This I attribute to a very late spring and the absence of frosts. Most fruits were blooming quite a month later than usual, therefore Apples and Pears set well. Caterpillars have been troublesome, and appear to have attacked certain varieties, Gascoyne's Scarlet Seedling having suffered perhaps more than any other. Gooseberries and Currants are very plentiful. Damson Almyweather is carrying a heavy crop. Plums are under average. Our soil is sandy loam resting on sand. *S. Baker, Chamber Gardens, Worksop.*

The Apple and Pear crops so far are very promising. No frost interfered with the blossoms, and the growth of the fruit has been uninterrupted. The foliage is clean and healthy, and there is a marked absence of insect pests. Cox's Orange Pippin is carrying fewer fruits than is usual here. This is probably due to the heavy weight of last season's crop. Ribston Pippin is quite good. *James Gibson, Welbeck Gardens, Worksop.*

The fruit crops in this neighbourhood are, on the whole, very good, but in some orchards caterpillars have been very destructive. The varieties suffering most are Allington Pippin, Cox's Orange Pippin, Newton Wonder, James Grieve, and Warner's King. Strawberries in these gardens have been especially good and plentiful. Small fruits are good. Plums, Apricots, and Pears are very light. *J. C. Latham, Park Hall Gardens, Mansfield Woodhouse.*

— Apples, our most important crop, had a wonderful show of bloom, as was the case with most fruits. A very fair crop set, but the great heat early in June caused a good deal of fruit to drop. This was especially the case with Worcester Pearmain and Bramley's Seedling. The best crops are James Grieve, a never-failing variety, Allington Pippin, Lord Grosvenor, Emmet's Early, and Gladstone. The trees are very healthy. Plums are a half crop, but are looking well. Early Prolific is a full crop, and Damsons are very heavy. Black Currants suffered from frost in May, and the bunches are very small. Red and White Currants, Gooseberries, and Raspberries are good. Strawberries suffered much from the winter, and plants were late in starting, but such as survived have cropped well. Royal Sovereign leading the way. Others carrying good crops were Scarlet Queen, Bedford Champion, Fillbasket, King George, Reliance, The Earl, The Queen, Vicomtesse Hélicart de Thury, and Pineapple, the

last named, with Compois-seur, being of the best flavour, though The Early, St. Pierre, and St. Joseph were very good. Runners will be late and scarce, especially in the late varieties. *J. B. Pearson and Sons, Loughham, Notts.*

OXFORD.—The fruit crops in this district are well up to the average. We had a record quantity of bloom and a good set, but since then insect pests, especially caterpillars and aphids, have spoilt what promised to be a record crop. Apples are a fair average crop; they are better on established orchard trees than espaliers; bushes have suffered very much from caterpillars, particularly Cox's Orange Pippin and Allington Pippin. Pears are a fair crop, but not so good as the bloom promised. Plums are good, the trees clean, and the fruit is swelling satisfactorily. Marbled Cherries are a fair crop. Peaches and Nectarines, both indoor and out, are heavy crops. All small bush fruits are abundant and good. Strawberries were a very light crop owing to drought. The soil is a light, shallow loam on oolitic limestone. *Ben Campbell, Carbury Park Gardens, Charlbury.*

— All fruit crops are exceedingly plentiful, and the trees are free from insect pests. The soil is heavy and retentive of moisture. *H. Miles, Carleton Park Gardens, Reading.*

— The Apple crop promises to be a very fair one in this district. Our best varieties are Irish Peach, James Grieve, Magnum Bonum, Cox's Orange Pippin, Lane's Prince Albert (very good), Cellini Pippin, and Tower of Glanville. Pears are bearing a good crop, especially Josephine de Malines, Le Lectier, Marie Louise, Souvenir du Congrès, and Pittaston Duchess. Plums vary a great deal. Some varieties are very thin, our best are Cox's Emperor, Kirk's, and Jefferson's. Bush fruits are carrying excellent crops, and are very clean. Raspberries are abundant on Superlative and Semper Fidelis; this latter variety is a good cropper, and very useful for preserving. Apricots are a fair crop of nice clean fruits. We have had a very heavy crop of Strawberries; Kentish Favourite (good cropper), Royal Sovereign, International, Latest of All, and Givon's Late Prolific. The soil is loam on limestone. *William J. Short, Middleton Park Gardens, Beccles.*

— Although late, the Apple and Pear blossom was a fine sight this year, and the trees and fruit now look very well. Peaches on outdoor walls are healthy, and carry heavy crops. Apricots are a failure here, also Strawberries. Potatoes look promising, and are yielding a satisfactory crop so far. The soil is light loam on gravel and chalk. Recent rains have done much good. *J. A. Hall, Shipdike Court Gardens, Holeywell-Thames.*

— The fruit crops round here are good, but in some instances Pears and Apples are not too plentiful. All bush fruits are good and clean. Peaches are good, and there is no blister on the leaves. Plums and Damsons are good. The recent rains have proved very beneficial to all trees and crops. *A. B. Waddis, Engleford Gardens, Reading.*

— The severe winter and rather cold spring seem to have suited fruit trees in South Oxfordshire, as the blossom was retarded until the time for frost had passed. Many Apple trees are casting off large numbers of fruit, but this is a good thing, as there will be plenty left, and the fruits will be larger than when over-cropped. Plums are abundant, and the trees are free from insects. Gooseberry trees are here badly attacked by caterpillars; handpicking of the pest has taken place. Strawberry plants were slightly injured by the dry weather, but rain came in time to assist the swelling of the fruit. Taking it all round it appears 1917 is almost a record year for fruit; the trouble is where to get sugar for preserving. The soil here is stony and poor. *L. J. Long, Wyfold Court Gardens, near Reading.*

(To be continued.)

The Week's Work.

THE KITCHEN GARDEN

By J. DENN, Foreman, Royal Gardens, Windsor.

SPRING CABBAGE.—A second sowing of Cabbage seed should be made at once in a fully exposed position. Sow thinly in rows 1 foot apart and keep the ground free from weeds and carefully netted to preserve the seeds from birds. Plants from early-sown seed will require attention, or slugs may do them much harm.

ONIONS.—Autumn-sown Onions should be lifted as soon as the weather is favourable and placed in a dry, open shed where they can receive the necessary attention to prepare them for the store. The bulbs should be turned frequently, and if hurdles are available on which they can be placed and raised a few feet from the ground so much the better, as this will enable the air to pass freely amongst them, the aim being to keep these bulbs as far into the winter as possible, so that the spring-sown Onions may be made to last, if possible, until Onions come again. A sowing of *Alisa Craig*, *The Lord Keeper*, and *Wroxton Globe* may now be made with a view to producing bulbs next season which will keep throughout the winter. Plants raised now are seldom attacked by maggot, and if transplanted on good, rich ground in March these should prove a remunerative crop.

EARLY POTATO.—As soon as the ground is sufficiently dry early Potatoes may be lifted in order that the ground may be utilised for some other crop. If the tubers are exposed to the air for a few hours before being placed in the store they will be all the better for it, and a sprinkling of lime over them may be applied with advantage.

FRENCH BEANS.—Continue to plant French Beans in pits where a little heat can be applied in damp weather in October. If sufficient pits are available Beans should be planted freely and an effort made to maintain a supply as far through the autumn as possible.

RADISHES.—A good sowing of Radishes may now be made in rich soil for autumn supplies; let water be applied frequently to promote quick growth.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMY COLMAN, Bart., Gatton Park, Reigate.

DENDROBIUM.—If the cultural conditions have been favourable, many of the species and hybrids of deciduous *Dendrobiums* will be completing their growths. Soon after the terminal leaf appears the plants should be placed in a cooler and drier atmosphere, where they may receive the benefit of extra sunlight and air. It is not always advisable to remove *Dendrobiums* from their growing quarters immediately they appear to have finished growth. It is better, where practicable, to select a position on one side of the house, where more air and light can be admitted and less moisture given them. Gradually expose them to the sun for a longer time than usual in the morning, and draw up the blinds a little earlier each afternoon. Do not allow the plants to become dry at the roots; water should be applied whenever the compost appears dry. Any sudden check at this stage will cause to start into growth buds that should remain dormant until after the flowering stage. After a week or two of such treatment the plants may be removed to a house of considerably less shade, with a drier and more airy atmosphere. Give them just sufficient water to keep any roots in a healthy condition and to prevent any undue shrivelling of the pseudo-bulbs. The plants that are well established in small pots will require more water at the roots than the larger specimens. The new pseudo-bulbs may be loosely tied to neat stakes, or be allowed to assume their natural dependent habit. *D. Wardianum* flowers more freely and its flowers

are shown to better advantage when the pseudo-bulbs are permitted to droop. The plants that are still in vigorous growth should be afforded plenty of heat and moisture, and be treated according to their stages of development. Aerial growths sometimes push forth from the pseudo-bulbs; these should be taken off, and if it is desired to increase the stock they may be potted either singly or several together. Cuttings inserted as advised in the calendar for April 21 last should be developing roots from the base of the young growths. After being potted they should be given a shady position in the house until they are rooted in the compost, when they should receive treatment suitable to established plants. Plants of the ever-green section of *Dendrobiums* such as *D. thyrsiflorum*, *D. densiflorum*, *D. swainsonianum* and *D. chrysoctenium* will be in the middle of their growing season. When these plants commence to develop fresh roots from the base of the young growths they can be moved into fresh teakwood baskets; use well-drained *Osunda* fibre; make it firm and place the plants near the roof-glass in the Cattleya or intermediate house.

PLANTS UNDER GLASS.

By J. G. WYSON, Gardener to Lady Norman, Eastwell Park, Kent.

AGAPANTHUS UMBELLATUS. This blue-flowered plant will thrive well in a cool green-house under ordinary treatment. It makes a fine specimen when grown in a tub or large pot, and usually flowers best when thoroughly established and pot bound. At this season it requires plenty of water, and applications of manure-water twice weekly. The flower spikes will last in good condition for a long time, when the plant is standing in a cool, well-ventilated house.

PERPETUAL-FLOWERING GARNATIONS.—These are now having their roots well established and should be given a top-dressing of manure. During the summer months Garnations do best out of doors, but they should be half-planted in coal-ashes or soil. As the growth elongates, attention must be given to staking and tying. Light hessian canes are recommended. If intended for flowering in the autumn and early winter, Garnations should be forced early, and be at no time allowed to become saturated with rains. The end of the present month is not too early to get them indoors. Examine the plants at intervals to see if any red spider is in evidence, and spray them occasionally with an insecticide as a preventive of the pest. If a spell of bright weather is experienced directly after housing the plants, give them a good syringing in the afternoon, sufficiently early to allow of the leaves getting fully dry before nightfall. Varieties of the type of *Carola* should not be put outside at all, as they are more healthy if grown in glasses the whole season.

THE HARDY FRUIT GARDEN

By W. A. COOK, Gardener to the Hon. Arthur J. Tracy, Alder Wood, Godalming, Surrey.

PEAR RUST makes its appearance in June, and very gradually increases till August, causing a yellowish spot on the underside of the leaf. In the case of an attack upon young trees, or those trees which have no fruit upon them, apply a good spraying of a solution made from 4 lbs. of lime and 3 lbs. of sulphate of copper to about 50 gallons of water.

PEARS. These fruits have improved immensely, especially on orchard-grown trees, since the heavy rains in the early days of the month. We measured 5.90 inches in five days. The net should be taken off the main buds of *Green-baynes*, and dried and folded up and labelled, because, and dried and folded up and labelled, if not required again for use, but they are useful for protecting Pears from birds, and if Pears are protected from birds, the birds get a taste, they do not give much trouble. If birds commence eating the fruits near the stalk the wasps will soon finish them. Williams' Bon Chretien, L'Amourable, Bourne Giffard, and Clapp's Favorite are varieties that are most often attacked. These should be netted first.

PLUMS.—Ripening Plums should have all unnecessary growths taken away, especially those that are shading the fruits. The early varieties should be gathered as soon as ready and made the most of by using them bottling or for jam.

FRUITS UNDER GLASS.

By JAS. THOMSON, Horticulturist at Gimptonbury House, A. O. W.

FRESHLY PLANTED VINES.—Young Vines that were planted this spring should by this time have made a satisfactory and vigorous growth. Where such is the case more ventilation should now be given them so that the young wood will gradually harden and mature. I have before referred to the treatment of the lateral growths on these vines. Now, I should let all such growths hang down rather than keep them on the trellis. In this way I have had young shoots from 4 to 6 feet in length suspended, so to speak, from the main rod. By so doing the main buds gain in plumpness and the wood ripens better. I do not advise the use of the knife at all on these young vines at this season; all that is needed can be carried out by pinching with the finger and thumb. The ventilation should be reduced in time to raise the temperature some 10° or so, but a little air may now be left on all night. When reducing the ventilation continue still to syringe the vines freely and early in the morning when it is not fair for a fine day. No fire-heat is now essential for young vines. Keep a close watch as to the state of the border, and do not on any account allow the soil to become at all dry. Make young vines, in my opinion, suffer from want of water rather than anything else. A course of treatment almost similar to that I have described is suitable for vines of the second and third year upon which a few bunches of fruit may be ripening. These vines cannot, of course, be sprayed, but nevertheless the atmosphere must not be kept too dry. As soon as convenient let these young vines be removed by their handles; do not keep them hanging just to look at, rather think of what is necessary to get a good crop next year.

THE FLOWER GARDEN.

By W. J. GILES, Gardener to Mrs. DEWISBUR, Keele Hall, Staffs-shire.

SPRING BEDDING PLANTS.—Vacant ground in the kitchen garden may be utilised for transplanting spring bedding plants; soil recently occupied by Potatoes will only need to be raked and made moderately firm. Plants that need attention at once include *Abutilons*, *Myosotis*, *Dianus*, *Campanulas*, *Arabis*, *Polyanthuses*, *Amorals*, *Violas*, *Fansies*, *Brompton Stocks*, *Honesty* (*Lunaria biennis*), *Alyssum*, and *Fox*.

If the weather be dry the plants should be watered a few hours before moving them. Frequent attention will be necessary in the way of watering and hoeing.

THE ROCK GARDEN.—Plants that have over-taken their space must not be allowed to smother the more choice varieties. Keep the plants free from weeds by careful hand weeding; remove all dead flowers and foliage, and stir the soil lightly with a small hand fork. Replace the soil where the roots have been exposed by heavy rains. It is advisable to keep a few Alpine plants in small pots to make good any failures that occur at any period. The plants must not suffer for want of water, and some may be found quite dry at the roots, even after rain. Young plants raised from seed should be transplanted without delay, and fresh seeds may still be sown to produce plants for next year, provided they are sown at once.

DEPHINUM. A second display of bloom may be obtained by cutting down the flower stalk at once. If seed is to be saved it should be cut a few days before it is quite ripe. There is still time to sow seed, but the same results must not be expected as from those sown earlier in the season. The old plants will need stimulants in the form of liquid manure or some approved fertiliser.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the matter printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 61.3.

ACTUAL TEMPERATURE.
Gardener's Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, August 16, 10 a.m., Bar 29.2, temp. 69.0. Weather Sunny.

Varieties and Food Values.

Attention has already been drawn in these pages to the importance of taking chemical composition into consideration when estimating the value of a variety of food producing plant. There are, of course, many other qualities which are essential and must be taken into consideration by the seed-raisers who are responsible for putting new varieties on the market. Moreover, in suggesting that the seed merchant or seed raiser of the future will have analytical chemists on his staff of experts, whose duty it will be to ascertain the chemical composition of new varieties, we do not forget that the chemical composition of a given variety of food plant—for example, a Mangold or a Potato—may vary widely according to the soil and climate in which it is grown. Such qualities as earliness, high yielding capacity, disease resistance, flavour, and the like, must all be considered if an attempt is to be made to compare scientifically the true values of two or more varieties of a given kind of food plant. In other words, the seed raiser of the future will not simply hand over his intricate business to a staff of chemists, but will use that staff in order to ascertain whether the new varieties which he proposes to put on the market show what we may call a chemical improvement on existing varieties. In illustration of the wide differences in chemical composition which exist between the chief varieties of a given kind of plant we may cite the figures published by Dr. F. T. Shutt, Chemist to the Dominion of Canada.* Analyses of 36 varieties of Mangold show that whereas the variety richest in dry matter contains no less than 13 per cent., the poorest variety in this respect con-

tains only 7.32 per cent. Furthermore, the former variety contains 5.66 per cent. of sugar and the latter only 2.86.

Figures such as these taken by themselves offer no proof that the rich variety is actually superior from the point of view of agricultural manufacture to the chemically poor variety; but they suffice to show that there is a well-established case for further inquiry. Such inquiry would have to concern itself with yield per acre and actual feeding value as ascertained by experiment, as well also as the suitability of each of the varieties to different soil and climatic conditions. It is evident, therefore, that long and thoroughgoing investigation would be required before all the data necessary for defining the "best" varieties could be ascertained. Such investigation is clearly beyond the scope of seed raisers, and would have to be undertaken by well-staffed scientific institutions working in co-operation with seed raisers. Yet it cannot be doubted that inquiries along these lines would be productive of results of great value. The agriculturist and the horticulturist are manufacturers of food, and their ultimate object is to produce economically the maximum amount of the best kinds of food. Without the application of the chemical test there is always a danger that the advantages promised by a new variety may not outweigh chemical disadvantages. That this danger is a real one is apparent from the observation made by Dr. Shutt in the course of the Report already referred to: "The average yields have assuredly been affected by the introduction . . . of a number of new varieties of more or less low feeding quality."

We commend this article to the notice of all those who are engaged in the seed industry, for although it may contain nothing that is new to them, it cannot fail to focus their attention on aspects of seed raising which are apt to be ignored.

One of the most instructive tables published by Dr. Shutt is that recording year by year for a period of 16 years the composition of two varieties of Mangold—Gate Post and Giant Yellow Globe. The average sugar content throughout this time was, in the case of Gate Post 6.16, and in that of Giant Yellow Globe 4.63, although, of course, the percentage of sugar in the juice fluctuated from year to year; nevertheless the former variety maintained consistently its superiority over the latter in this respect, demonstrating conclusively that "blood will tell." The varieties had precisely similar treatment, and were grown side by side on the same soil in the Central Farm, Ottawa.

THALICTRUM DIPTEROCARPUM (see fig. 26).—The beauty of this comparatively new species of Thalictrum from China is so irresistible that it is not surprising that the R.H.S. Flood Committee decided a fortnight ago to give it the highest award available, namely, the First-class Certificate, the Award of Merit granted in 1906 being scarcely adequate. Its tall, branching inflorescences are most graceful, whilst the colour

of the flowers is the daintiest and most pleasing shade possible. It is perfectly hardy, and grows with the utmost freedom.

AUTUMN SHOWS.—The Royal Horticultural Society's Vegetable Show will be held on September 25, and the show of British-grown fruits on October 9. Schedules for both shows can be had on application to the Secretary, R.H.S., Vincent Square, Westminster, S.W.

CENTENARIAN MARKET GARDENER.—The *Times* announces the death, in the first week of August, of Mr. William Turner, a market gardener, of Carisbrooke, Isle of Wight, at the age of one hundred years.

KENT APPLES.—The annual auction sales of Apples on the trees in Kent have commenced, and good prices are being realised. Near Paddock Wood four acres of Apples were sold for over five hundred pounds, and a couple of acres at Tonbridge for two hundred and thirty pounds.

CROP PROSPECTS.—The Board of Agriculture, reporting on agricultural conditions in England and Wales on August 1, states that the weather during July was mostly warm and dry until the end of the month, when rain set in, and that the conditions were generally favourable to the crops on the whole, especially in the west. Wheat shows some improvement during the month; it is considerably better in the west than in the east of the country, prospects varying from about average in the counties bordering on the Severn, to nearly 10 per cent. below in Lincoln and Norfolk. Barley is the best of the corn crops, but promises to be over average only in the west and north. Oats are a variable but poor crop, prospects being much worse in the eastern corn growing districts, but average or even over in Wales and the north-west. The two latter crops, more particularly, have been a good deal damaged by the storms at the end of the month. Beans appear to be the worst crop of the year, especially in the east; Peas are better, but not up to the average. Potatoes are everywhere promising; no district anticipates a yield below average, and in many areas in the south they are expected to yield 10 per cent. above the mean. There is a certain amount of disease in the south-west, but in the rest of the country very little is reported. Roots are healthy and promising. All through the dry period of the month fly was very troublesome, and many fields had to be re-sown. The rain towards the end came in time to effect a material improvement. Mangolds were suited by the weather, and a further advance may be noted in their prospects, which are everywhere above the average, except in the extreme north. Summarising the returns, and expressing an average crop by 100, the appearance of the crops on August 1 indicated probable yields per acre which may be denoted by the following percentages: Wheat, 95; Barley, 99; Oats, 93; Beans, 85; Peas, 94; Potatoes, 105; Mangolds, 102; Hops, 101; and seed hay, 96; meadow hay, 91.

RAILWAY GARDENS.—The annual inspection of the gardens on the Underground Railways of London has just taken place, and prizes to the total value of about £50 have been awarded by the company. The three 1st prizes, £3 each, have been awarded respectively to Inspector FRIWELL (Northfields Station), Platelayer ECCLES (South Kensington Station), and Foreman MACEY (Waltham Green Station). Further prizes are being offered to the staff for the best collection of vegetables, whether grown on or off the company's property.

LOCAL SOCIETIES.—The annual show of the Nulley Cottagers' Horticultural Society was held on July 25. In consequence of inclement weather the number of visitors was small, but the exhibits were numerous and of good quality. Fruits and vegetables were the chief features. The exhibition of the Whetstone (Herts.) Amateur Gardeners' Society, held on the 26th ult.,

* Part of the Division of Chemistry, 1916, OTTAWA.

FIG. 28. THALICTRUM DIPTEROCARPUM. COLOUR OF FLOWERS A PRETTY SHADE OF MAUVE-BLUE.
Awarded R.H.S. Crystal Palace on August 16, 1906, and R.H.S. First-class Certificate on July 31, 1917 (see p. 70.)

in the Congregational Hall, was very successful. The fruit was especially fine. The Honeysuckle Amateur Horticultural Society held their eighth annual exhibition on July 23; the exhibits, which consisted chiefly of vegetables, were creditable and well staged, and there was keen competition in the class for allotment holders. The Leyton Allotment Holders' Society held a successful show on the 6th inst. The produce was afterwards sold for the benefit of St. Dunstan's Hostel for Blindfold Soldiers, one Vegetable Marrow fetching three guineas. On the same day the West End Association (Leicester) organised an exhibition on the Gandy Cricket Ground. The Challenge Cup presented by the *Leicester Daily Mercury* for the best collection of vegetables grown on an allotment was won by S. L. Coombs, who also won a prize for the best cultivated allotment. The twentieth annual show of the Gargrave (Yorks) Horticultural Society took place on the 4th inst. It consisted mainly of exhibits of vegetables and fruits, the most keenly contested classes being those for cottage gardeners.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

FROST AND EVERGREENS (see fig. 27).—Some weeks ago I gave a brief account of the results of stripping the injured leaves from evergreen trees damaged by frost (see *Gard. Chron.*, July 7, p. 8), and mentioned the particular instance of *Beithamia fragrans*. Since that note was written the effects of the removal of the leaves have become so striking, that it seems worth while to revert to the matter again, especially as they lend themselves to photographic illustration (see fig. 27).

In my previous note I referred to two branches which were stripped of their damaged leaves, and I should also have mentioned one small lateral branch on the opposite side of the tree, which was similarly cleared as a sort of control. The illustration shows clearly that the new leafy branches have pushed, and are developed well on these two main branches, which are on the side exposed to the north wind (left hand in the illustration), and also on the small lateral branch on the south side of the tree. Practically all the shoots which began to push on the unstripped branches have died, although at the very base, where the tree splits up to the main divisions, young shoots are now beginning to push. There is no doubt, from the results, that if I had stripped the leaves from the whole of the tree every main branch would have been saved. The experiment is interesting as throwing some light on the water relations that obtain in a tree of this sort during the winter. It is tolerably clear that the wood contains, in ordinary circumstances, a quantity of water, which is sufficient to meet the requirement of the young leafy branches when they push in late spring; and the roots, of course, continue to maintain the supplies which are lost by the transpiration of the tender leaves. But it would appear that the margin in frosty weather may become a small one. During heavy frost the roots are unable to discharge their functions properly, and as soon as the thaw comes, especially if it be attended by sunny weather, the old leaves begin to lose considerable quantities of water. If this goes on at too rapid a rate, damage occurs, and whether the leaves have been otherwise injured by frost or not they may wither, in consequence of shortage of water supply, and the effect will be greatly aggravated if they have already been really damaged. Loss of water continues, and it is not unlikely that air may ultimately replace part of the lost water in the wood vessels and tracheids. If this occurs in any serious degree the tree may at once die without showing any signs of renewed vitality. But if, as often happens, the loss of water from the wood has not been too great, the young shoots may sprout, only to wither back as the available water supplies that can be passed to them from the wood have to be deficient. I think that this is the obvious interpretation to be placed on the results detailed above. It seems certain that some

obstacle (such as air in the tubes) prevented the adequate water supplies reaching the shoots, in the unstripped boughs later on, as otherwise one would have expected the entire water contents of the tree as a whole to have been pooled. Instead of this we find a sharp separation between the boughs that were, and those which were not, defoliated, a separation that becomes more instead of less marked as the days pass by. It is not improbable that further experiments will afford some variety in the results obtained, and it seems reasonable to anticipate, not only that such diversity will actually occur, but that it will find its explanation in differences which obtain in the mode of water-and-air distribution in the tree. No doubt the facts and their causes are analogous to those observed in, e.g., a Yew bush when a number of its leafy branches have died. Everyone knows how the removal of the dead (evaporating) stuff is promptly followed by the pushing of new shoots, leading to the renovating of the bush. However this may be, the importance of preventing the loss of valuable evergreens is so great as to justify a full consideration being given to the matter as a whole, and it is the hope of inducing others to help in elucidating the rather complex, though very attractive, problems here indicated that must serve as the excuse for my returning again

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

July 31.—*President*: Mr. E. A. Bowles, M.A., (in the chair), Messrs. J. Fraser, H. J. Elwes, and F. J. Chittenden (hon. sec.).

Spencer Cupid Sweet Pea.—A Certificate of Appreciation was unanimously recommended to Mr. George T. Dickson, Newtownards, for his work along Mendelian lines in raising the Spencer type of flower combined with the dwarf habit of the Cupid form of Sweet Pea.

Damage by Hail.—Mr. Fraser showed a series of plants, including Onions, Potatoes and Peas, in which the damage done by hail storms in June was very evident. The Potato had its stem broken, and both Peas and Onions showed white spots as a result of the battering by the hail-stones.

Various Plants.—Mr. Elwes showed a number of plants from his garden, including *Poterium tenuifolium* album, which there attains to 6 feet in height; *Prunella grandiflora* and *P. Webbiana*; *Dendrobium aurantiacum*, the pseudobulbs of which are collected and used in Japanese medicine; *Lycoris squamigera* and *Crinum*

FIG. 27. FROST AND EVERGREENS.

(The leaves on the lower of *Beithamia fragrans* plant are dead.)

to the matter, and at greater length than before. J. B. Farmer.

SOME NOVELTIES.—I agree with Dr. H. E. Durham (see p. 42) if he applies the word "novelty" only to new plants or varieties. I did not, however, use the word thus; I intended to convey that the plants were *novel* in the garden. *E. Molyneux, Swanmore Park Farm, Bishop's Waltham*.

GRAPES WITHOUT FIRE-HEAT.—During a visit to a neighbouring garden I saw some very satisfactory crops of Grapes (Black Hamburgh, Madresfield Court, Buckland Sweetwater, and Muscat of Alexandria, which had not received at any period during the present year any aid from fire heat. The vines named are growing in a lean-to house; the bunches weigh from 2 lbs. to 5 lbs. each, the berries are swelling regularly, and some of the varieties are beginning to be tinged with amber. Often the night temperature was as low as 55° during the blossoming period. It is evident that Black Hamburgh, Madresfield Court and other varieties are quite amenable to cool house treatment, and succeed under such conditions. Last year similar methods were adopted, but during the month of September and onwards a little artificial warmth was given to ripen the berries, which kept in good condition until the middle of January. E. M.

Yemens, which thrive at Colebourne against a wall; *Crinum Rattrayi*; *Hydnocallis* sp. with an exceedingly sweet scent; *Alstromeria peruviana* alba; and a species of *Himmamania*, a tender plant which when treated as a half-hardy annual does well outdoors.

Nuttallia crassifolium.—*Fruiting*. Mr. Bowles showed fruits of *Nuttallia* from his garden. Most trees and shrubs of spring-flowering habit appear to be fruiting freely this year.

Curious Sport in Delphinium.—Mr. Berkley, of Redgate Hall, Wolsingham, Co. Durham, sent leaves from a Hybrid Delphinium in his garden, one branch of which, while bearing normal flowers, differed from the others in having entire leaves similar in form to those of *Clematis integrifolia*.

Blackthorn Growing on Apple Bark.—Sir Harry Veitch sent a piece of Apple bark from which a Blackthorn, *Prunus spinosa*, was growing much in the same way as does Mistletoe. Mr. Elwes mentioned the case of a Hawthorn which was growing from the branch of a Scots Fir, apparently, as in the Blackthorn shown, rooting into the branch itself.

Sport in Diervilla.—Mr. John Griens sent from his garden at Cardiff branches of *Diervilla rosea* in which, instead of the normal opposite decussate arrangement of leaves in the upper part of the shoots, the leaves were in whorls of three. This had first occurred in 1915.

ROYAL HORTICULTURAL SOCIETY.

Aug. 14.—There were some empty spaces in the Drill Hall on Tuesday last, and War notwithstanding a holiday air abroad. Some interesting exhibits were staged, but novelties were few, and the attendance small throughout the day. Mr. E. W. WALLACE gave a lecture on "Water Gardens" in the afternoon, and Mr. VINCENT BANKS followed with a demonstration on "Fruit and Vegetable Bottling and Drying."

The members of the Floral Committee turned up in goodly numbers, and gave their chairman, Mr. Henry B. May, a hearty welcome upon his return after a serious illness. A note of sorrow mingled with the gladness, however, when Mr. W. B. Cranfield rose to pay a tribute to the work and memory of the late Mr. Drueury, who was a member of the committee for many years.

Stokesia carynea, S. c. alba, the dark blue-purple *Acronium Spargeri* variety, and the elegant *Thalictrium diphyllum* were all well shown in a group of hardy flowers, notably *Phloxes*, set up by Mr. JAMES FOX, Mr. G. RENTHE made a feature of *Berberis pinnatifida* and *Eucryphia pinnatifolia*, both charming shrubs. A whole length of table was again occupied by *Gladioli* staged by Messrs. KEENE AND SON. On this occasion there were about four hundred spikes displayed, and a fine contrast was made by associating the deep purple-blue of *Baron Joseph Hulot* with the varying shades of yellow found in the *Lang-pain* hybrids derived from *G. primiflorus*. *Baron Broward* is evidently a descendant of *Baron Joseph Hulot*, but has lighter coloring in the throat.

A suggestion of autumn was provided by Messrs. J. CHEAL AND SONS, who displayed show *Cactusi*, *Faenoli*, and single and star *Phloxes*, as well as *Shrub*, and a collection of sprays of trees and plants, the latter including trailing branches of *Pyrus Aucuparia luteocarpa*, *Viburnum Lonicera*, and *V. Opulis*. *Fish-ton Wonder*, of a pale shade of heliotropine and very sweetly scented, was a fine Carnation in Messrs. WILWOOD BROTHERS' stand; this firm has now adopted Carnations at every meeting of the Royal Horticultural Society for two years.

A bright salmon-pink *Phlox* named *Andrey Alder* was submitted by Mr. W. WELLS, jun., and it is a very beautiful form, with a narrow centre. The wonderful variation in *Nephelepis* was made very evident by the many forms grouped by Messrs. H. B. MAY AND SONS. A group from the Alder River Nurseries was greatly admired; it contained *Crimm Poyellii alba*, *Thalictrium diphyllum*, the graceful *Coriaria japonica* (finely fruited), *Lilium Henryi*, *Lycomis samaritanica*, *Asparagus Mooreanus*, and varises of the deep blue fruits of *Clintonia Androsiana*. Interesting plants brought from Colchester by Mr. H. J. EWES included *Crimm Moorei* var. from South Africa, a splendid form, and finer than the other varieties shown; *Hedychium Gardenianum*, H. *Greenii* (scarlet), H. *occidentale*, H. *spicatum* (white), and H. *gracile*, with tiny, whitish flowers. SAREPS MORRIS, Esq. (Mr. G. Hebblethwaite, Norwich), exhibited three fine *Montbretias*, and of these the vivid orange *Queen Adelaide* was the larger and most brilliant.

Athyrium Filix femina *Christiana*, shown by Mr. W. B. CRANFIELD, Enfield Chase, was a superb and elegant specimen, with graceful fronds over a yard long, and about 15 inches across at the widest. Accompanying this plant was a letter from Mr. Cranfield to the Chairman of the Floral Committee, as follows:

East Lodge, Enfield Chase.

"DEAR SIR, I have thought the occasion appropriate for submitting to the notice of the Committee a division of the original plant of *A. F. F. Christiana* upon which the late Mr. C. T. Drueury discovered the phenomenon of Apospory. It was found by R. Monte, in North Devon, in 1868, and passed into the possession of the late Col. Jones. The form is the rarest and one of the most beautiful in our native *Athyrium* family, and possesses the additional merit of being a wild find. A number of Aposporous off-springs were raised and distributed by the late Mr. C. T. Drueury, but they differ materially from the parent, as many Aposporous off-springs do, in that their development is

nothing like so luxuriant or regular as the original.

"My plant has not been grown for exhibition, but in a herbarial shelter, with other choice forms. Yours faithfully,

W. B. CRANFIELD."

A Cultural Commendation was awarded to Mr. CRANFIELD for this fern, and it may be added that the variety gained a First Class Certificate in 1875.

The Fruit and Vegetable Committee had a fairly long sitting, but the only outward and visible sign of their deliberations was the award of a Silver-gilt Banksian Medal to Messrs. DOBBIE AND CO. for a superb exhibit of Potatoes. This group consisted of twenty baskets of exceptionally clean and sharply tubers; the examples of *Midlothian Early*, *Chimax*, *Great Scot*, *Edzell Blue*, *Witch Hill*, *Sir John Llewelyn*, *Empire*, and *Duke of York* were particularly fine. Mr. C. URMAN, Bushey Lodge, Teddington, sent a variegated form of the *Musselburgh Leek*, and Mr. BARNUM, Belsize Court, Hampstead, showed specimens of *Valparaiso Blood Peaches*. Mr. and Mrs. BANKS staged an interesting collection of bottled fruits and vegetables and dried fruits and vegetables, as used by them in the demonstration given during the afternoon. Judging from some branches shown in full fruit by Mr. H. CROSS, there are wonderful crops of them at his Ongton fruit farm.

Floral Committee.

Present, Mr. Henry B. May (chairman), and Messrs. W. B. Cranfield, W. G. Baker, W. J. Bean, G. Renthe, John Green, Sydney Morris, J. T. Bennett Post, R. W. Wallace, H. Cowley, F. Hooper Pearson, A. G. Jackson, John Heald, C. Dixon, C. R. Fielder, Thos. Stevenson, Arthur Turner, E. F. Hazelton, W. P. Thomson, J. F. M. Esal, J. Jennings, Chas. E. Pearson, E. H. Jenkins, George Paul and Wm. Howe.

Award of Merit.

Androsalis Lady Rosemary Portal.—A beautiful large-flowered variety with bluish white flowers, the lower inner segments having a creamy yellow shading and a median line and penicillings of lavender on the basal half, where the yellow tinting is deepest. From Messrs. J. KEENE AND SON, Longport.

Cultural Commendation.

To Mr. W. B. CRANFIELD, for specimen of *Athyrium Filix femina*.

Groups.

Silver-gilt Bankian Medal.—To Messrs. J. KEENE AND SON, for *Gladioli*.

Silver Flora Medal.—To Messrs. H. B. MAY AND SONS, for Ferns, and to Mr. J. FOX, for *Phloxes* in pots and hardy flowers.

Silver Banksian Medal.—To the Alder River Nurseries Co., for *Liliums*, etc.; to Messrs. ALWOOD BROTHERS, for Carnations; to Messrs. J. CHEAL AND SONS, for shrubs and *Dahlia*s; and to Mr. G. POTTING, for hardy plants.

Orchid Committee.

Present, Sir Henry J. Veitch (in the chair), and Messrs. J. O'Brien (hon. secretary), William Bellin, R. A. Rolfe, F. K. Sander, J. E. Shill, J. Charlesworth, Arthur Dye, C. H. Curtis, W. H. White, C. J. Lucas, R. G. Howates, F. J. Hensbury, E. R. Ashton, T. Armstrong, and Paulin Ball.

Awards.

Award of Merit.

Cattleya Alboni O'Brieniana alba s. *Saxonia Hoch*, from Messrs. ARMSTRONG AND BROSSE, Orchard House, Timberidge Wells. A charming addition to the *O'Brieniana* alba crosses, all of which are noted for the compact form and durability of their flowers. The *C. Alboni* is a model in shape, the flowers well displayed, and of firm substance, pure white, the prettily crimped lip having a clear chrome yellow disc. The small seedling plant bore a strong spike of two flowers.

Cattleya Acuminata var. The Baron (Re) s. *Dowiana aurea*, shown by Mr. J. E. SMITH, The Dell Gardens, Enfield Green. A showy flower, quite intermediate between the two parents. The sepals and petals are bright yellow, the petals having a rose-coloured veining at

the tips. The lip is large and of magenta crimson with rose margin, and with golden-yellow lines from the base to the centre.

GENERAL EXHIBITS.

Silver Flora Medal were awarded to Messrs. ARMSTRONG AND BROSSE, Orchard House, Timberidge Wells, for a group of showy *Lilium-Cat* (Leys), etc., among which were a fine example of the deep rose and purple *L. C. Geo. Woodlams*, with a selection of hybrids from it of fine quality, and including *L. C. Rhemus* and *L. C. Magueda*. A large white *Miltonia axillaria* *Queen Alexandra*, and various hybrid *Odontoglossum* and *Odontiodas* were noted; and Messrs. CHARLESWORTH AND CO., Heywards Heath, for a group which included *Lilium-Catleya Laura* (*L. C. Scylla* s. *C. Lord Rothschild*), with pale yellow sepals and petals tinged with rose, the lip having gold lines; and *L. C. Pica* (*L. C. St. Gothard* s. *C. Empress Frederic*), with rose and five purple lip having clear vein (s.).

Silver Banksian Medal to Messrs. SANDERS, St. Albans, for a group, the best plants in which were the very large and handsome *Lilium-Catleya Solange* var. *Britannic* (*C. Dowiana aurea* s. *L. C. Lustro*), with deep rose sepals and petals and large purple labellum with yellow disc; the albino *Catleya Leopoldii Sandersae*, and *Brassia Cattleya Rex* (*B. Digbyana* s. *C. Rex*), white, with yellow disc to the lip.

Messrs. FERRY AND BLACK, Slough, showed a fine form of their *Brassia Cattleya Bena*, very large, tinged with soft rose, the broad, fringed lip having a bright yellow disc.

Fruit and Vegetable Committee.

Present, Mr. Joseph Cheal (in the chair), Lord Lamborne, Rev. W. Wallace, and Messrs. E. A. Bayard, F. Perkins, A. R. Allan, J. C. Atterley, Edw. n. Bockett, P. C. M. Veitch, W. H. Dwyer, Owen Thomas, W. Bates, H. Somers Rivers, and A. Bullock.

Group.

Silver-gilt Banksian Medal was awarded to Messrs. DOBBIE AND CO., Edinburgh, for a collection of Potatoes.

Obituary.

C. T. DRUEURY. The death of Mr. C. T. Drueury, V.M.H., which we announced last week, occurred at his residence at Axton, after a long illness borne with exemplary patience. Deceased was a prolific writer on horticulture, an accomplished linguist, and the author of numerous works in poetry and prose, but it will be by his writings on British Ferns and their varieties that his name will be particularly associated.

Born in 1845, it was in the later seventies that he first commenced the cultivation of the varieties of British Ferns which he afterwards pursued with much enthusiasm, and recommended to others, with such conviction. As a Fern hunter and raiser he was second to none. The creation of the Superbum section in *Athyrium Filix femina*, and the *Gracillimum* types in *Polystichum aculeatum*, many of which have received recognition at the hands of the Royal Horticultural Society, were themselves achievements of the highest order, whilst his many wild finds testified to the keenness and accuracy of his observation. His three works on British Ferns and their varieties, viz., *Choice British Ferns*, published in 1891, *Book of British Ferns*, published in 1903, and *British Ferns and Their Varieties*, published by Routledge in 1910, are standard authorities. For many years he was a member of the Floral and Scientific Committees of the Royal Horticultural Society, whilst he was one of the first sixty to be awarded the Victorian Medal of Honour in Horticulture. His discovery of Apospory secured his recognition at the hands of some of the foremost contemporary botanists and scientists. He was one of the oldest members of the British Pteridological Society, of which Society he had acted as president and hon. secretary. He also founded and was the editor of the Society's *Gazette*.

His contributions to the horticultural press extended over a number of years. He was an accomplished draughtsman, and the illustrations in most of his works are productions of his own pen. He was one of the founders of the Horticultural Club, and served on its committee from its establishment in 1875. He was a regular attendant at its monthly meetings and at the annual outings.

The remains were laid to rest in Acton New Cemetery on Saturday last, in the presence of many relatives and friends, whilst floral tributes from absent friends and from the societies with which he was associated testified to the universal respect and esteem in which he was held.

We understand that the entire collection of British Ferns accumulated by the late Mr. Chas. T. Drury, and grown by him at Acton for many years past, and all his books, specimens, and papers relating to them will pass into the hands of Mr. W. B. Cranfield, of Enfield Chase, Middlesex.

CROPS AND STOCK ON THE HOME FARM

WINTER GRASS FOR COWS.

Pastures that have been heavily grazed during the summer should be given a rest, even if but for two or three weeks. Cut off any tufts of coarse grass, Thistles, or other obnoxious weeds that may be present, including Ragwort, which is very common this year, but may easily be got rid of by pulling it up with the roots. With a hoe spread the cow and horse droppings to free the grass underneath. Thoroughly scratch the surface with chain or tooth harrows, spreading the manure evenly. Well roll the plot to make firm the grass after the harrowing, and in two weeks an improvement will be manifest, especially if the weather is showery.

MAIZE FOR CATTLE.

The seed sown in May under favourable conditions has this year produced a vigorous plant, now 4 feet to 6 feet high, and it is quite ready for use, but as there is almost a plethora of grass the Maize is not yet required. A small quantity fed to the cows in the shed while being milked will improve the quantity, as well as the quality of the milk. For horses, too, Maize is a good food cut with the hay or straw chaff.

BASIC SLAG FOR GRASS.

The value of basic slag for grass as a means of improving the sward is becoming more generally appreciated, indeed, as it does, an increase in the growth of Clovers and the finer grasses. As basic slag contains as much as 55 to 55 per cent. of lime, many think that on grass overlying chalk the slag can have no good effect. But these scepticisms must be worn down.

For several years I have tested the value of basic slag on grass on the Downs, where but 4 inches of soil in some places overlies the chalk, perhaps 200 feet deep, yet the improvement in the grass after one dressing of slag at the rate of 5 cwt. per acre, four years ago, is obvious even after that lapse of time.

Basic slag will promote the growth of Clover where Clover was never known to grow. Too often those who decry its use have not applied it at the right moment. They are apt to think the month of April is soon enough, as in the case of some other artificial stimulants, whereas, owing to its slow rate of assimilation, basic slag should be applied early in November at the rate of 4 cwt. or 6 cwt. per acre, thoroughly harrowing the grass previously, and do not let cattle or sheep run over the grass for two months after the slag is sown. *E. Molynous.*

ENQUIRY.

CAN any reader inform me as to the price usually paid for bottling fruit, 1-lb. and 2-lb. jars, the price for bottling only, not including cost of fruit? *J. S. W.*

ANSWERS TO CORRESPONDENTS.

ASPARAGUS PEAS. *J. Radlett.* The seed of Asparagus Pea, or Lotus Tetragonolobus, should be obtainable from any of the leading seedsmen. Seed should be sown thinly about the middle of April, on a south border, leaving a space of 12 to 2 feet between the rows, and 6 to 8 inches between each plant. Prepare the ground carefully before sowing, and water the plants in dry weather, both at the root and overhead.

BRITISH GARDENERS' ASSOCIATION. *H. J. H.* The secretary of the B.G.A. is Mr. Cyril Harding, Ulysses, Fortune Green, London, N.W., from whom you can obtain all information.

FLORA. *R. H.* There is no general work on cultivated plants so complete and so fully illustrated as Bentham and Hooker's *Handbook of the British Flora*, but Nicholson's *Dictionary of Gardening*, including the 1900 Supplement, is the nearest approach to it. This work comprises six volumes and is encyclopaedic in character. It is illustrated by upwards of 3,200 uncoloured figures and a few coloured plates. Its work is now, unfortunately, out of print, but might be obtained at a second-hand bookseller's. There are cheap volumes

early, but if at all late, some protection will be needed, such as a piece of glass over a light staging. Protect the sides with garden netting, to prevent the birds from taking the seed, but be careful to secure ventilation. When ripe, pull up the plants, and thoroughly dry them, by hanging them up, before storing the seed.

MADRESFIELD COURT GRAPES. *C. B.* The cause of the splitting is bad ventilation. A chill has been caused by damp, cold, stagnant conditions in theinery at night, followed by sudden and intermittent outbursts of bright sunshine on the following day. To prevent a recurrence of the trouble next season, when the first berry shows sign of colouring, maintain a little gentle heat in the pipes night and day, with the top ventilators never quite closed. Regulate ventilation according to the sunshine. A light, buoyant, ever-moving atmosphere is necessary for this Grape. The other Grapes named are thicker-skinned varieties, and able to stand even a cold, stagnant atmosphere, but one of the parents of Madresfield Court (Black Morocco) also splits occasionally.

NAMES OF PLANTS. *F. C.* *Mentha sylvestris*, a common plant in southern Europe, usually found in ditches and along the roadside, but a doubtful native of this country. It is fairly general in the South of England, but rarely found in the North.—*J. R. B.* *Pernettya mucronata*. The colour of the fruits in different varieties of the species varies from white to purple. *H. W.* *Alnus cordifolia* (the Naples Alder), illustrated in the *Gardener's Chronicle*, March 5, 1883, p. 295.

PACKING PEACHES FOR TRANSIT. *Lightfoot.* The boxes used should be about one inch and a half deeper than the height of the Peaches. On the bottom of the box put a layer of half an inch of soft weed-wool, and a small roll of the same material, wrapped in paper, all round the sides. Place the Peaches in position, with a small piece of the wool between every Peach, until the box is filled. Then gently press down the wool with the fingers so as to make the whole quite firm. It is upon firmness that the safety from injury greatly depends. When the wool is well pressed down, half or a quarter of every Peach will be showing. After this is done lay a clean piece of paper over the fruits, upon which place a layer about an inch thick of the wool, to keep the fruits from shaking about.

PEAS. *T. and S.* The Pea specimens you sent us are of a species known as *Pisum elatius*, usually called the "Mummy Pea." It is quite distinct from the Sweet Pea (*Lathyrus odoratus*), and the plants are not in the least likely to be reversions from that plant. It would appear, therefore, that in some unexplained way the seed has become mixed.

POTATOS. *C. G. J.* The haulm has been destroyed by what is known as late blight, caused by the fungus *Phytophthora infestans*. The crop might have been saved if the plants had been sprayed earlier in the season with a fungicide, but the disease has now reached a stage which does not admit of remedial treatment. *T. A. R.* A species of *Verticillium* occurs on the stem, and may be the cause of the wilting of the plant. Avoid using such plants for seed purpose.—*Wolverhampton.* This is an extremely bad case of infestation of the "wart disease" (*Synchytrium endobioticum*). This disease is required to be notified to the Board of Agriculture, Whitehall Place, London, S.W., who will supply free an illustrated leaflet giving the best means for its eradication.—*Potato.* There is no fungus on this tuber.—*H. T. W.* This is an attack of common scab (*Actinomyces scabies*).—*D.* The pink-skinned Potato is of the variety known as Mr. Breeze.

THE LATE MR. C. T. DRURY.

containing coloured illustrations on many classes of plants in the *Present-Day Gardening Series*, price 1s. 10d. each, post free.

GRAPES CRACKING. *C. M. L.* It seems probable that your vine border became dry in the early part of the season, causing growth to be checked and the skin of the berry to become prematurely hardened. When the rain came abundantly the pulp swelled more quickly than the skin could expand. Insufficient ventilation in hot weather, with a humid atmosphere in the house just when colouring and the second swelling commence, will also cause cracking, by forcing a superabundance of water into the fruit, which, under more natural conditions, would be transpired from the leaves by the stomata.

LEATHER CUTTINGS FOR MANURE. *H. G. K.* We learn that experiments have been made in the use of leather cuttings for manure, but they have not been successful, owing to the fact that the leather takes two or three years at least to disintegrate. However, if you write to Mr. M. C. Lamb, Leathersellers' College, 176, Tower Bridge Road, S.E.1, he may be able to give you further information, as we understand some of the experiments were conducted by him.

LETIVE SEED. *M. H.* If possible, the plants from which seed is to be saved should be

CLIMBING PLANTS

(Present-Day Gardening Series) By WILLIAM WATSON.

(Introduction by William Robinson.) A Practical Handbook on the Treatment of Climbing Plants, both hardy and tender species.

Illustrated with 24 full page plates, 8 of which are reproduced in colour. Price 2/10 post free from: The PUBLISHING DEPT., "GARDENERS' CHRONICLE" OFFICES, 41, Wellington Street, Covent Garden, W.C. 2

REMARKS: These are plants of Asteraceae family, although some show signs of being waterbeaten.

A TREASURY OF INFORMATION

is contained in the

HORTICULTURAL DIRECTORY AND YEAR BOOK.

Nowhere else can the gardener obtain, within the small compass of four hundred pages, so much information on the subjects which interest him most. The knowledge which this little work contains is just what is indispensable to the gardener in his daily life. The

CALENDAR OF GARDEN OPERATIONS

takes him through the whole year, reminding him of the manifold small cares which make all the difference between health and ill-health in his plants. It also reminds him of the exhibitions which are to be held and of the most important annual meetings.

Another interesting section, which expands each year, is the list of

SCHOOLS OF HORTICULTURE,

with a brief description attached to the name of each such institution. Those concerned with the education of young gardeners—both men and women—will turn to this section with especial interest, and those who are seeking such education will find it of the greatest assistance in deciding which school to select. There are still for sale a few copies of the current edition.

WANTED, JOURNEYMAN for Inside, good general all round, in IMBROGLIO or Inside—State wages, with both, and good full particulars to H. KEMP, Priory Gardens, B. 2 20.

WANTED, MAN (ineligible); used in head and pony both in yards, 25s. weekly and 10s. war bonus. Apply, A. P. RAMBECK, Park Lodge, Watlington, Northamptonshire.

WANTED, LADY GARDENER, to take charge of Plants and Flowers under Glass, must have a knowledge of Orchids, a good general all round. State experience and wages required to GARDENER, William Lodge, Felham, Middlesex.

WANTED, TWO WOMEN GARDENERS for Houses, one qualified to spray. Bonus, and also experience in the House and in the garden. Full particulars, cottage provided. State full particulars, wages required, to ALMOND, Haverhill, London, E.C. 1.

WANTED, Young MAN, to help in Flowering grounds and Kitchen Gardens. State experience and wages in full, to B. W. HAWKINS, The Gardens, Galsdon, Haver, Kent.

WANTED, strong, intelligent YOUTH, for Inside, in large establishment, one with some experience preferred, good wages, both, milk and vegetables, overtime and duty paid. State age and experience to HEAD GARDENER, King's Walden, Herts, Hitchin.

WANTED, active LAD for the Houses, wages common to 17s. Sunday, duty paid, aged both; 1. Brock Sandon, 2. HOWARD, Benthams, Valence Gardens, Newbury.

TRADE.

MAN WANTED, by a Market Gardener, to take charge of 5 or 6 acres Glass, 20 acres open land, experienced in Tomatoes. Apply, stating wages required, A. W. SMITH, Felham, Middlesex.

WANTED, a Good, Practical GARDENER for a small Both Farm in West of England where Vegetables are also grown, must be married, sober, and industrious, comfortable living quarters. Write to B. Box 11, 41, Wellington Street, Covent Garden, W.C. 2.

WANTED, (in immediately), PROPAGATOR, GROWER, or skilful worker, Tomatoes, good at weathers. Private Gardeners used to weathering soil, State wages, references. RYTRAY, Ash Vale Nursery, Ash-street.

WANTED, in September, GROWER (in-eligible), thorough knowledge Tomatoes, Cucumbers, Chrysanthemums, and market produce. Apply, stating experience, wages, full particulars, G. J., Northgate Nurseries, Devizes, Wilt.

WANTED, GROWER for Branch Nursery, Tomatoes, Cucumbers, Chrysanthemums, &c., for shop trade. W. CROWDER & SONS, Hereford.

WANTED, immediately, NURSERY PROPAGATOR (outdoor), chiefly for Fruit and Rose Trees and Conifers. Apply, W. SHAW & SONS, Nurserymen, Leicester.

PRIVATE GARDENERS awaiting Situations may obtain temporary employment until special Particulars, &c., from JOHN RESELL, Devonshire Nurseries, Haverstock Hill, N.W. 3.

WANTED, KNIFE-MAN, and as GENERAL FOREMAN, for 12 acres young Fruit Trees, ages 40s. and odd, the cottage, State age and full particulars of training to STORRIE & STORRIE, Fruit Tree Specialists, Gleadless, Fife-shire.

WANTED, WORKING FOREMAN for Nursery of 20 acres; no Glass, must be well up in Fruit Trees and have a knowledge of Trees, Shrubs, Roses, &c., permanently.—State age, wages, full particulars, and references to HILLIER & SONS, The Nurseries, Winchester.

NEAR MANCHESTER—Wanted, active and capable WORKING FOREMAN, to take charge of single Nursery, 25 per cent. of profits, in addition to wages. Address, stating age, experience, references, and wages required, M. R. Box 24, 41, Wellington Street, Covent Garden, W.C. 2.

WANTED, as FOREMAN, thoroughly experienced man in Horticulture and Rock Plants, 2 or 3 acres, must have first-class references. Apply, R. C. SPOWELL, The Nursery, Woodbridge.

WAREHOUSEMAN wanted for the Agency, 10, South Trade. Apply, T. & R. OAKLEY, Hastings.

SITUATIONS WANTED.

Twenty-six words for 1s. and 6d. for each succeeding eight words or less.

Gardeners desiring their Advertisements repeated must give full particulars, otherwise no notice will be taken of their communications. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. On no account should they enter into communication with unknown correspondents who require a fee beforehand.

PRIVATE.

GARDENER, BAILIFF or ESTATE SUPERVISOR, 12½ years' experience in all branches of general gardening, very highly recommended, over 20 years' experience in practical, leaving nothing to be desired in working arrangements. Woodstock Park, Epsom, Surrey, in Thames.

A GENTLEMAN highly recommends his Head Gardener and Bailiff, thoroughly experienced in all branches of Gardening, Farming, and Estate Work, Wood Accounts; good manager of men; also a very capable general. J. PEPPER, 10, Gooding Road, Berks, in Thames.

GARDENER (HEAD) or GARDENER (BAILIFF), well up in all requirements of a good establishment, very highly recommended, over military age. For particulars, W. R. GARDNER, Antons, Horse Guards, Piccadilly, Devonport.

GARDENER (HEAD), FRUITS, with 20 years' experience, good; highest references for the best and highest; good worker and organiser. Life spent in large places. age 46.—A. Box 5, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD): life experience in Fruit, Flowers and Vegetables, Inside and Out; crops 2c. Peaches, Melons, Eggs; also Herbaceous Borders, Lawns, and Pleasure Grounds; married; age 37. G. D. HOOD, Home Park Gardens, Thame, Oxon.

GARDENER (HEAD): special on Vines, P. in, Roses, Saffed Peas, Chrysanthemums, and Cucumbers, constant supply of Vegetables and general management of a good Garden; age 39.—B. Box 4, 41, Wellington Street, Covent Garden, W.C. 2.

SITUATION required as HEAD GARDENER or SINGLE-HANDED; thoroughly practical with Fruit, Flowers, and Vegetables, under Glass or Outside. Please state wages, &c., H. MORRIS, 45, Rompark Road, Salisbury, Wilt.

GARDENER (HEAD), open to engagement; highly accomplished; expert in every branch of Horticulture.—Apply, G. ABBEY, High Street, Wallington, Oxon, via Wallingford.

HEAD GARDENER: life experience in all branches, 10 years as Head, good references, age 47. Apply, WM HITCHMAN, 1, Orchard Street, Spalding.

LADY SUDELEY can fully recommend her very experienced late Head Gardener for charge of recreation ground or similar position of trust where reliability, but not heavy manual labour, is required.—C. TAYLOR, Garden Cottage, Ham Common, Surrey.

GARDENER (HEAD WORKING).—Col. BASTARD, Kitley, Yeovilton, highly recommends F. BRINCOMBE as a thorough, practical man, desires arduous engagement; life experience; well versed in the requirements of good establishment; 10 years present situation, age 46, married (2 girls, youngest 12); leaving through death.—BRINCOMBE, Buckland Court Gardens, Ashington, Devon.

GARDENER (HEAD WORKING), where several are kept; thoroughly experienced in all branches, over military age.—Please state wages, &c., to GARDENER, Bonley Cottage, near Kentworth, Warwickshire.

GARDENER (HEAD WORKING or SINGLE-HANDED); age 48, married (no family); life experience in all branches, Inside and Out; good references.—A. H. HAWES, 72, Hamilton Road, East Finchley, London, N. 2.

GARDENER (HEAD WORKING) seeks situation in good establishment; age 43, thoroughly experienced in all branches, including Orchids; excellent references; used to positioning Fruit and Vegetables in large quantities.—WARREN, The Gardens, Sandhurst Lodge, Wellington College Station, Berks.

GARDENER (HEAD WORKING); thoroughly experienced in all branches; can be highly recommended; over military age. Apply, H. BORTON, 59, Rosenthal Road, Catford, S.E.

GARDENER (HEAD WORKING) seeks situation, 4 under in last place; also versed in Landscape Gardening; married (no family); over military age. H. RUSHAM, Stockton, Gt. East St. Mary, Wilt.

GARDENER (HEAD WORKING); good all round experience, Inside and Out; age 46; married (2 children); good references.—BEAN, Downe, Uppington, Kent.

GARDENER (HEAD WORKING) requires permanent situation; life experience, Inside and Out; age 40; married; present situation 14 years; good references.—G. CORNWELL, Honica, Cottage, Cross-in-Hand, Sussex.

GARDENER (HEAD WORKING); good all round practical experience, Glass, Fruit, Flowers, Fencing, &c.; above military age; married (no family); 11 years as Head, excellent references.—F. BRISSON, Westport, Statham, Midhurst, Sussex.

GARDENER (HEAD WORKING); age 50; in good establishments, thoroughly experienced in all branches, including Orchids; excellent references; a general all round.—RICHARDS, Fenmore Place, Fulmouth.

GARDENER (HEAD WORKING), with a thorough practical experience, Inside and Out; excellent references; married, age 50. H. NEWTON, White Horse Hill, Chislehurst, Kent.

GARDENER (HEAD WORKING); good all round practical experience; Glass, Fruit, and Flowers, Fencing, &c.; above military age; married (no family).—GARDENER, Fulmer Grange, Stoke Poges, Slough.

GARDENER (good SINGLE-HANDED); Nursery and private experience with Stoves, Orchids, and routine of Garden; 47; good reference.—H. LUCAS, 94, Cock Lane Street, St. John's Wood, London, N.W. 4.

GARDENER and HANDYMAN seeks situation, single life; married (small family); disengaged; good refs.—P., Douglas Villa, Orchard Grove, Chalfont St. Giles, Bucks.

GARDENER seeks situation (SECOND or SINGLE-HANDED); experienced Inside and Out; Please state wages. KILLICK, 47, Kambala Road, Balfour, S.W. 11.

GARDENER (SECOND), in medium establishment, or good SINGLE-HANDED might suit; good experience in all branches; married (no family); Army discharge; Surrey preferred; late of Heathfield and Osterley Park. Full particulars to R. J. HORTLOCK, 4, Great Woodside Cottages, Purley, Surrey.

STORAGE OF POTATOS.

THE methods of storage of Potatos adopted in different parts of the country and by different types of growers are so varied as to suggest to a hasty observer that they cannot all be based on sound principles. Nor, indeed, is it our present object to prove that "whatever is"—in the way of Potato storage—"is right." Nevertheless, careful inquiry and consideration will show that the differences in method are in the main due to attempts to settle a difficult matter—which admits of no absolutely perfect settlement—by compromise. The reasons why a compromise, and not a perfect system, must be adopted are, first, that to store Potatos in absolutely perfect conditions would cost more than they are worth, and second, that the conditions required to ward off one danger are those which, if adopted too thoroughly, are likely to expose the tubers to another danger. The stored Potato is undoubtedly then the devil of heating and the deep sea of dampness. For example, if a clamp be made impervious to rain, it is well-nigh inevitably impervious also to air. The free circulation of air among the Potatos is checked and the worst of all evils, the sweating and heating of the heap, befalls the tubers. The danger of loss from this cause is, of course, greatest during the first months of storage; for during that period the tubers are not yet dormant. They are gradually passing into a dormant or somnolent state, but in the meantime they are respiring—that is, performing chemical operations which require oxygen for their initiation and result in a liberation of carbon dioxide.

Now, it is well known that if living

vegetable matter be in active life it is possible to cause it to kill itself by packing it closely in a confined space. For instance, if young leaves be packed closely together, the heat which they produce in the course of their respiration is so great that the temperature in the centre of the mass rises to and beyond the death point, and the leaves are killed.

So in like manner it is possible to kill Potatos, as it were, by kindness. If as soon as they are lifted they are packed away snugly in a perfectly made and finished clamp, heating, sweating and subsequent rotting are almost bound to occur. The risk of this result is rendered the greater by reason of the fact that, like men, no crops of Potatos are perfect. No matter how carefully they may have been hand-picked, some unsound and diseased Potatos are almost certain to be included in the stored tubers. Each diseased Potato is a source of danger to its fellows. The disease lurking on or in it may and will, if the conditions are favourable, spread to and infect its healthy neighbours.

Certain good general rules may be deduced from these considerations. These rules are:—

- (1) The more perfect the ventilation, the better the clamp.
- (2) The more recent the digging, the greater the need for perfect ventilation, and in those cases in which the clamp is finished off at making time occasional opening of the clamp and overhauling of the tubers.
- (3) The fewer diseased Potatos included in the clamp, the less the risk of loss.

The philosophy, though not the whole philosophy—of clamping may be summed up thus:—In the early days let air into the tubers, even though in doing so some rain may get in also; in the later days, keep rain out, even though by so doing some air is kept out also.

There are, so far as our observation goes, three general methods of clamping. One, which we think is the least satisfactory, is to make haste to build and complete the clamp soon after the Potatos have been lifted. The thick covering of straw and earth which is put in at the finishing of the clamp—even though ventilation pipes are inserted—impedes the free circulation of air, and the Potatos are bound to suffer. Another method which is often adopted by good growers is probably the best where large quantities of tubers have to be handled. After grading and rejecting diseased tubers, the tubers are built up in the clamp, leaving a base about 3 feet or 3 feet 6 inches wide, and with sides as straight as possible, so that ultimately the section of the clamp will have the form of the arms of the letter A. The straw (long wheat, or, failing wheat, barley straw—not oat-straw) is put in position along the sides and ends of the clamp, care being taken to push the bits of straw well down to the ground. For the edge of the clamp is its Achilles' heel on which frost later on makes its attack. Earth from the drainage trench is thrown over the base of the straw, and also about the middle,

in order to keep the covering in position. The cap of long straw covering the ridge and passing over the straw of the sides is also put on, and kept in position by similar means. Circulation of air takes place readily through the 4 inches of straw and also through the mass of Potatos, provided that the mass be not too broad. Later on, when the waning vital activity of the tubers has ceased and when frost is to be expected, the clamp is completed. The 6 or 12 inch rampart of earth is built up over the straw almost to the apex of the ridge, and the narrow ridge is closed by means of short straw.

What, in our opinion, is the best method of all is to carry the Potatos to the dry part of the field in which the clamp is to be built: if sorting and grading can be done before they are carted, so much the better. If not, they must be sorted and the diseased tubers rejected (boiled and fed to pigs). They are put in heaps, either on the dry ground or on a layer of Bracken previously spread thereon. The heaps, not more than 2 feet or 2 feet 6 inches in height, are covered lightly with Bracken. At intervals of two weeks the tubers in the heap are looked over and the diseased tubers, many at the first inspection and fewer at the last inspection, are removed. Late in November in a normal year the clamp is made. As a further preventive of the spread of disease quicklime, or quicklime mixed with flowers of sulphur, is dusted among the Potatos. This precaution should also be followed by those who practise other methods of storage.

It is evident that in many cases at the present time labour difficulties may prevent the adoption of the last described method. Nevertheless, it is one which is to be recommended whenever it is practicable.

In this method of deferred clamping no ventilation chimneys are required; but if the clamp is made earlier it is advisable, though in the opinion of some good growers not essential, to put in ventilation shafts at intervals along the clamp. The ventilation shafts, made of drain pipes, should not, however, be upright, but should be placed near the top of the sides, not quite horizontally, but pointing somewhat downwards. In the outlet of the shafts a little loose litter—Bracken, Heather, etc.—is placed.

Unless the clamp shows signs of giving in, it may be left undisturbed until February. If left longer before it is examined, many of the tubers will have sprouted.

The storage of Potatos for seed purposes is a difficult subject to discuss, because the method to be adopted must be governed by the facilities of space, buildings, and labour at the disposal of the grower. There is little doubt, however, that if a sufficiently large frost-proof and well-lit shed is available, boxing, essential for earliest, is best, also for second earlies and main crop varieties. Boxed in November, and kept in a well-lit, cool, but frost-proof shed, the tubers will green

thoroughly, and the sprouts will be stocky and solid. Needless to say, the boxes, if piled over one another, must nevertheless not be so close as to obstruct light and air. This method, only possible to the small grower or to the specialist large grower, has the great additional advantage that tubers which have failed to sprout or have produced only poor shoots may be discarded and not planted, for there is reason to believe that these tubers are often the foster-parents of late blight. If planted, they will only produce weakling plants which, suffering from premature old age, readily contract the disease. Hidden by the taller neighbouring plants, they escape notice, and spread the disease to the lower leaves of the plants in their vicinity. So, like a thief in the night, the disease makes its attack. It cannot be insisted on too strongly that late blight is, like some human diseases, a disease of old age. Old age, though generally associated with length of days, may display its symptoms in things which, though young in years, have raced in a futile way through the course of their life and "are rotten ere they are half ripe." It appears probable that the prematurely old-aged Potato is a frequent source of infection. Naturally, the debility of old age may be brought about either by untoward soil conditions, or it may be due to constitutional weakness. By boxing and rejecting the tubers the sprouts of which have failed to develop in a normal manner the constitutional weaklings may be discarded.

The storage of allotment Potato crops presents in some cases considerable difficulty. Clamping is often out of the question, owing to danger from pilferers. Where small quantities are to be stored a larder, if not too damp, is a suitable place. If the Potatoes are stored in thick sacks, stood on boards with wooden battens, dusted with a little quicklime, or quicklime and flowers of sulphur, and picked over both before and occasionally during storage, they should keep well. If the larder is not proof against frost a covering of loose litter, Bracken, Heather, or crumpled, but not crushed, newspapers will give protection; or the sacks may be taken, on nights of hard frost, into the kitchen. Failing a larder, a cellar, if it is well ventilated, may be used. The Potatoes should be laid in heaps on the floor, but the heaps should be shallow—about 1 foot or 1 foot 6 inches in depth. Old sacking or litter may be placed over them in frosty weather. Although not connected with storage, a word may be added on choice of seed. Many allotment-holders will be tempted to use their own seed tubers. But unless they grew Scotch or Irish seed, and unless their plots lie in good Potato districts, such as the silt of Lincolnshire and Cambridgeshire, and the warp of Yorkshire, they should on no account rely on own-saved seed. They should obtain either Scotch or Irish seed, or else once-grown Scotch or Irish raised in a good Potato district, such, for example, as one of those already mentioned. Although "own-saved-one-from-Scotland" seed may be used where experience has already shown that it gives good results, its use should be avoided in other cases, and particularly by those whose plots are on light soil.

ORCHID NOTES AND CLEANINGS.

NEW HYBRIDS

CATTLEYA PHAEDRA.—This is a brightly coloured hybrid, between *C. Dowiana amica* and *C. Elvina* (*Schilleriana* × *Trianae*), sent by Mr. F. C. Puddle, gr. to W. H. St. Quintin, Esq., Scampston Hall, Billington. The sepals and petals are rose-pink, the lip, which strongly indicates *C. Schilleriana*, is ruby-purple in front, and on the tips of the erected side lobes. The

rose-coloured base bears gold lines. Mr. Puddle also sends a home-raised *C. Warszewiczii*.

BRASSO LAELIO CATTLEYA WINDSOR.—A flower of this cross between *Brasso-Cattleya Thouronii* and *Laelio-Cattleya callistoglossa* is sent by Messrs. Mansell and Hatcher, Rawdon. The sepals and petals are rose-pink, the slightly fringed labellum light rose, veined with rosy mauve. The disc is yellow on a white ground. The brightly coloured veining on the inside of the side lobes of the lip is an attractive feature.

MALFORMATION

CYPRIPEDIUM MILLEMANI.—A three flowered inflorescence of this hybrid, between *C. callosum* and *C. philippinense*, is sent by Mr. F. C. Puddle. One of the flowers is curiously malformed. The upper sepal is divided and joins the lower sepals, extending on each side, while the imperfect petals are joined and placed erect in the position normally occupied by the dorsal sepal. The column is malformed and straightened, but the lip is almost normal.

FIG. 20. APPLE STEM AFFECTED WITH BROWN ROT CANKER. THE DEAD SPUR WAS ATTACKED WHEN IN FLOWER.

THE MARKET FRUIT GARDEN.

A VALUABLE REPORT ON BROWN ROT

UNDER the title of "A Blossom Wilt and Canker of Apple Trees," a report on Brown Rot experiments by Mr. H. Wormald, has been issued by the Cambridge University Press, as a reprint from the *Annals of Applied Biology*, April, 1917. Brown rot, it is pointed out, is increasing in intensity year by year, and has now assumed epidemic proportions, causing considerable loss to fruit growers. In some cases 50 to 75 per cent. of the blossom trusses and spurs of Apples have been killed by the disease (see fig. 20). At present no spray material for effectively checking the disease has been discovered, trials hitherto having given only negative re-

sults. Much benefit, however, has been obtained by cutting off the withered spurs as soon as possible after they have been observed. This is in accordance with apparent results in my experience, as, after cutting off and burning the diseased spurs from all but one badly-attacked variety in 1915 and 1916, the attack was greatly diminished in 1917, while the excepted variety is more extensively injured this season than ever before. It is of importance to cut off the diseased spurs as soon as possible after they have been observed, in order to prevent the extension of the rot to the branches from which the spurs issue. Where the extension has taken place, as it has done in many cases when the withering has been noticed, brown rot canker is found on the branches at the bases of the spurs, and such parts should be pared out as far as the bark is brown, and jet into the sound bark, which should be dressed with Stockholm tar. In many cases I have found cankers two to four inches in length at the bases of diseased spurs, and even at those of tiny snags which few pruners would think it necessary to cut off, unless they had noticed the result of leaving them intact. When the canker is found to extend all round a branch, there should not be any hesitation in cutting off the branch below the diseased place, at once if there is no fruit upon it, or after the gathering of the fruit when there is any above the cankered spot, as the speedy death of the portion above that spot is certain. The permanency of the injury caused by the disease is indicated by the fact that where many spurs have to be shaved off a branch, the latter will be bald to a great extent for the whole of its subsequent existence. Still, by cutting off the withered spurs before they have decayed down to their junctions with the branches, the extensions above the treated places may possibly be saved from future injury, whereas every diseased spur left on a branch will be a source of infection for the following season. Where sufficient men are not available, women should be employed to do the necessary work. Investigations at Wye support the conclusion of some foreign mycologists as to the existence of two species of brown rot, one of which attacks the blossom and the wood, and the other the fruit. This is in accordance with the fact that, while there is a great deal of the disease on some varieties of Apples in my orchards, as seen in withered spurs and cankered branches, there has never been any considerable proportion of mummified fruits. Conversely, there has been a considerable proportion of mummified Plums even where hardly any brown rot has appeared on the spurs or the ends of shoots. I have very little brown rot on Plums this season, an exemption attributed to the cutting off and burning of diseased parts in recent years. The disease appeared on Plums in my oldest orchard some years before any attack on Apples was noticed.

LUCERNE IN ORCHARDS.

My attempts to obtain a full plant of Lucerne in some orchards has been mainly, but not entirely, successful, in spite of the fact that a hot fortnight's drought succeeded each sowing. Failure in one case was due to the seed having been buried too deeply by simply hoeing it in. The land had been hoed a short time before, and was nearly free from weeds. In this case there was no room between the rows of trees to harrow the seed in. In another orchard, after horse cultivation, the seed was harrowed in between the rows of trees, while the land in these rows was hoed before the sowing, and the seed was covered by means of hayrakes afterwards. Here there is an excellent plant of Lucerne, although in places the pestilent Bindweed has grown rampantly with it. Whether the weed or the Lucerne will gain the upper hand after the first cutting remains to be seen. Where the failure took place, re-hoeing, re-sowing, and raking in the seed have resulted in a full plant, now almost smothered in places, however, by Bindweed. *Southey Grove.*

CONFESSIONS OF A NOVICE.—XVI.

NOVICE AS ALLOTMENT HOLDER.

As those may remember who have read my confessions, no motive of material gain clouded the pure passion with which I fell in love with gardening. If anything of calculation there was, it lay rather in the direction of gardening as a kind of old-age insurance. It was a new game that can be played all the year round, in all weathers, and alone. It is true that, like Bacon, I took "all learning for my province," and felt as deep an interest in the tragedies of the kitchen garden—club root and fly and mildew, wireworm and maggot and blight—as in the happy dramas of the flowering shrubs and herbaceous borders where any pests that harbour can compass no complete tragedy. They may strike down the Antirrhinums, but if they do the Delphiniums and the Larkspurs bring flowers to the Snapdragon's grave.

Now, since in obedience to the exhortations to grow more food, I have turned my garden into an allotment, the flowers, like Boy Scouts and Girl Guides, seem to have resolved to do good deeds every day. Left alone, they are flourishing in a wild riot of colour, far more luxuriantly than when they were so carefully watched and tended. The Ramblers, left unsprayed, make light of mildew, and like Apollon straddle all over the way, blooming alike high up the Laurels and low on the ground in the high grass of the unknown borders. I am aware that the neglect which the flowers are enjoying bodes no good for their future welfare. In the Rose beds Manetti stocks have begun to rob their *Edgors*—the onions planted upon them.

But it is of the "allotment" gardens—my own and those of my neighbourhood, that I wish to speak. So far, in spite of the forebodings of the wireworm, has done little or no damage. The season, together with a dressing of sulphate of ammonia, enabled the Potatoes sprouted when set out to grow away quickly. A dressing of agricultural salt seems also to have done good.

Our plot of early Potatoes *Kelpe*, Lincolnshire seed, one year from Scotland, has been dug, and has given a good crop, about 12 tons to the acre. But the chief interest of this plot is the wonderful illustration it gives of the mode of operation of late blight. Except for two patches which are badly diseased, the haulm is clean. The two patches lie each above a field drain, which, owing to the position of the outlet had to be placed within 6 inches of the surface. The ground on which the two diseased patches stand is always damp. No Potatoes have been grown on this plot for many years, and there are no diseased Potatoes near. It is evident, therefore, that the disease came with the seed, and that it only broke out in those spots in which the soil conditions—as a result of the late muggy and rainy weather—were favourable to its development. Whether, as is probable, it arose from one or two diseased plants, and spread to the neighbouring haulm, or whether the original outbreak was more general, I cannot say. But the point which seems to me to be of great importance is this, that it is certain that other tubers planted in other parts of the ground must also have been carrying the germs of the disease. Will the new tubers of Potatoes, the haulm of which is entirely free from signs of blight, contain the fungus, or will they be free from it? I believe the modern view is that the course of disease is from tuber to growing haulm, on the leaves of which the spores appear in due season, fall to the ground and infect the young tubers. But is it certain that the disease may not proceed direct from mother to daughter tuber? For if the latter event may occur, the importance of change of soil becomes self-evident. It is easy to imagine that this direct tuber to tuber infection may only occur under certain unfavourable soil conditions, and in that case the belief, common among gardeners, that change of seed—not only change to Scotch or

Irish seed, which is admittedly safest—but also change, say, from a chalky to a sandy soil, owes its beneficial effect to this—that direct tuber infection only occurs generally on "bad" Potato soils. I wish that the experts who have made a special study of the course of infection in the case of late blight would enlighten this novice on the subject. I wish also that they would collect a summary of spraying results, preface it with a simply-written account of what is known with certainty of the life history of the disease, and publish it for our benefit. For I have seen plots in allotments marked not to be sprayed side by side, with others bearing placards "to be sprayed." I venture to think that it would be better, where practicable, to segregate unsprayed and sprayed plots, so that all the Potatoes on one allotment field are sprayed. If this were done, the conscientious objectors to spraying might give effect to the faith that is in them without detriment to the plots of their neighbours. I. N.

NOTES FROM FRANCE.

BY A MEMBER OF THE B.E.F.

A GARDEN GARDEN. There is a fine little garden "somewhere in France" belonging to a country cure who is very keen on getting plenty of food from his soil. That it is not far behind the line may be judged from the fact that five or six shells dropped in the precincts of the garden while I was in the neighbourhood. A bomb from an aeroplane has uprooted and destroyed a promising pyramid Pear, and shrapnel has cut the bark of many of the wall trees. The garden is surrounded by a wall about 6 feet in height, enclosing nearly a quarter of an acre of land. There is a border about 5 feet wide against all the walls. A path, 4 feet wide, skirts the borders, and a central path 5 feet wide, drains the inner portion of the garden into two spiral plots. The walls are covered with trained trees of Pears, Apples and Apricots. The latter trees, of which there were only two, showed no sign of fruit. The Peach trees, however, gave promise of a good crop, notwithstanding the unorthodox method of pruning, which, I understand, was done by a superannuated inner-tuned gardener. The border skirting the wall facing north was planted with a row of Raspberries, bordered by a thick line of Sorrel. The waste of space was to be regretted, and was surprising in view of the economic arrangement of the garden in other respects. The Raspberries did well, for the wall shaded them but slightly, and I had the pleasure of gathering practically the whole crop. The border facing east was planted with young Strawberries, which gave a good crop, though a fair portion of it was still by reason owing to the bed not being struck. The south border was used for Lettuces, *Batishes*, Cucumbers (for pickling, being known, I gather, by the name of *Cornichons*), and seed beds. The Cucumbers are sown and not transplanted; they are allowed to grow very thickly. They give a good crop if the fruits are picked when quite small. I undertook the work of thinning the Lettuce bed, and the small plants, even when there were only a couple of leaves, were used for salad. The border facing west was used for grass, which was cut as required for the poultry. Bushes of Gooseberries and Red and Black Currants skirted the outer sides of the large plots, planted barely 2 feet from the path. The space between the bushes was used for Strawberries, Sorrel and Chives. Sorrel seems to be largely grown in French gardens. Standing a little back from the line of fruit bushes were two Cherry and two Plum trees. The Cherries gave a good crop while I was there, and the flavour was greatly appreciated by one who now eats very few of such

luxuries. The main path had a border on either side about 3 feet wide. The background was a line of Pyramid Pears of such varieties as *Doyenne du Comice*, *Williams's Bon Chrétien*, *Marie Louise*, *Easter Beurre*, and other varieties which I do not now remember. These borders were given over to flowers such as *Lilium candidum*, Carnations, Roses (Frau Karl Duschki, *Caroline Testout*, and *Gloire de Dijon*), *Yuccas*, *Spiraea filipendula*, *Paeonies*, and others. The vacant spaces were planted with winter greens—obviously a war-time venture only. A fair breadth was given over to Potatoes, and almost an equal area to Haricot Beans in successive sowings. Only dwarf Peas were grown, four rows at a foot apart being sown every few weeks. A fair-sized plot was planted with Leeks just before my departure. Drills were cut out a foot apart and the plants set at 4 to 6 inches apart in deep holes, which were not filled in. The tops were cut off, as is the practice sometimes in England. Leeks, though of small size, are largely grown by every garden owner in the neighbourhood, being used for soup. Haricot Beans also form a large crop. Despite the language difficulty I had several interesting though disjointed chats with the good cure. One crop grown was called "Belle Dame"—I must confess that I did not recognise it. Perhaps some reader can enlighten me. Shallots were grown in considerable numbers, and although planted only 9 inches apart, were intercropped with Lettuces. "Ail," which I understand to be a species of Garlic, was also grown and intercropped in the same manner. *William F. Roulès*. "Belle Dame" is one of the many names given to the plant *Atriplex hortensis*. The young leaves are used as a substitute for Spinach. You are right in supposing Ail to be Garlic.—EHS.]

ON INCREASED FOOD PRODUCTION.

AUTUMN SOWN ONIONS.

THE Onions raised in autumn constitute the most useful crop. One continually hears complaints of the loss of the spring crop, and a great loss it is, as in kitchens of any importance Onions are required every day in the year. But if autumn sown Onions were more extensively and generally grown the supply would be more certain and satisfactory. By sowing at once young plants will be produced by November, and in the absence of others some of these may be employed in the kitchen, and many people will use them as salad.

In April and May they will have formed good bulbs, which will keep excellently for culinary purposes well into the autumn. Indeed, good varieties will keep as well throughout the following winter as any of the spring-sown bulbs, and anyone may easily keep up an all-the-year-round supply of Onions from autumn-sown seed alone, while there is this important advantage, that the plants are not so liable to be attacked by grubs as spring-sown plants.

I strongly recommend two sowings, one now and the other about the second week in September. Good ground must be used. It may be deep or shallow, stiff or loose, but it must be rich. Firm soil is an advantage, as the plants grow robust in it and bulb much better than in very loose soil; indeed, the latter will never produce first class Onions. Although autumn-sown Onions are not so liable to become maggoty as the spring raised plants, they are not altogether proof against the enemy, and it is best to take precautions against this pest when the soil is being prepared for sowing the seed. It will most likely require manuring, and besides this a good sprinkling of salt and soot should be put in; or wood ash is as good as either. Ordinary lime is also valuable, and each or all of these materials should be thoroughly

mixed with the soil as it is turned. The seeds may be sown immediately after digging, in rows 16 inches apart, and not more than 2 inches below the surface. If the drills opened for the reception of the seeds can be filled with better material than the ordinary soil of the quarter it will benefit the seedlings when they are very small. In covering them, the surface over the seeds should be trodden firmly and then made smooth. The following varieties are to be strongly recommended: Ailsa Craig, White Leviathan, Lemon Rocca, and Monster White. *James J. Paice.*

BOLTING ONIONS.

THE plan of pulling off the flower-heads of autumn-sown Onions as soon as they appear (see p. 52) has been the practice of good gardeners for many years, and if carefully attended to for a few days a good crop can be secured. The flower-stems will develop afterwards to the usual size; they are easily removed when the bulbs are harvested, and very little difference occurs in the weight of produce, but the bulbs are not so shapely as those which do not run to seed.

The Royal Horticultural Society is doing a good work in trials of vegetables. I have seen the Wisley collection several times this season; the percentage of bolting plants seemed to

satisfactory results in the way of crops, but thanks to excellent results from advertisements in the *Gardeners' Chronicle* and the *Journal of the British Gardeners' Association*, and assistance from the local Labour Bureau, gardeners were obtained and the ground prepared.

All the sites that had to be cleared were as the builders and contractors had left them: on one site alone there were 500 cartloads of rubbish, including two large beds of cement and railway-track ballast, which had to be carted away before the land could be cultivated. About 60 tons of timber had to be removed from another plot, and a further 50 tons of felled timber and brushwood cleared. As most of the land was old turf it had to be hasted trenched by manual labour, and I doubt if any other class of labour of any description would have been capable or willing to make the sacrifice these gardeners made in the national interests. They worked seven days per week on work of the very hardest nature, and the remarkable progress made has enabled the scheme to produce, since the second week in July, vegetables in sufficient quantities to supply the workers' canteens, where several thousands are fed daily. The illustration in fig. 29 and list of quantities below will give some idea of the amount of vegetables deli-

over 2,200 sales were transacted. The firm has decided to open a shop in the works to supply workpeople who reside in the colony attached to the works with fresh vegetables.

We have now over 60 acres of land under cultivation, two-thirds of which have been brought under cultivation by hard manual labour. It is a fine example of what can be done in a short time, and I trust that this war will bring the practical gardener to the front as a food producer, and that he will receive his due recognition, as up to the present he has been sadly neglected. It is evident that the country has learned a home truth which should enable the gardeners to be placed in a proper sphere in the near future. This terrible war has rather reduced the value of the adage "Man doth not live by bread alone," for events have fully convinced us that without bread men cannot live. *R. Greenfield.*

THE TREATMENT OF OLD PASTURE.

It is not yet sufficiently realised by growers who wish to use old pasture for vegetable production that such ground requires very long preparation. The ideal method is to plough the land, leave it for several months to give the turf an opportunity of rotting, and then plough

FIG. 29. A DAY'S SUPPLY OF VEGETABLES FOR MUNITION WORKERS.

be much the same among those that were transplanted in March and those which remained where they were sown. Probably much of the bolting is due to the abnormal winter and spring, but it is partly owing to wrong measures in sowing the seed. White Spanish and Autumn Triumph have done well as autumn sown varieties. The Tripoli varieties cannot be recommended for keeping after November. For the midland and northern districts Giant Rocca or the Red Italian Tripoli are valuable for hardness and weight of crop; Ailsa Craig or one of its near relations may also be grown. Giant Lemon Rocca has produced a heavy crop at Wisley, and would be preferred by the market grower for ripe Onions, as the Red Italian kinds are not favoured by the dealers when fully grown. White Italian Tripoli, and similar white varieties, are not to be trusted on cold, heavy soils, as they are more subject to mildew than the red or brown varieties. Transplanting in March has proved the best system at Wisley. *W. H. Drewes, Westdean, Hook.*

VEGETABLES FOR MUNITIONERS.

AT a large munition factory in the Midlands a "Works Garden Scheme" was commenced on March 24, 1917. This was far too late to expect

covered daily to meet the requirements of the factory workers' canteens:—25 cwt. Potatoes, 1,200 lbs. Peas, 360 bunches of Carrots, 200 bunches of Onions, 300 Cabbages, 200 lbs. of Runner Beans, 1 cwt. of Marrows, 250 Lettuces, and 6 doz bunches of Parsley. No farmyard or stable manure has been used in the production of these crops.

The value of a scheme of this nature, supplying thousands of workers with wholesome fresh vegetables (which will eventually be the means of doing away with the unsatisfactory system of workers bringing their own food from home), cannot be over-estimated. There is a marked change in the environment of present-day factory life which will go a long way to solve the existing dissatisfaction amongst the working classes. Our own doctor states that the improvement in the general health of the employees since the garden scheme commenced is remarkable.

In connection with the scheme we have 160 allotments for the workpeople, which are let out in one-eighth and one-sixteenth acre plots; also 120 girls' garden plots, the latter being cultivated in the girls' spare time.

All surplus vegetables, plants, and seeds are sold to employees, and up to the end of July

again, disintegrating the turf, and breaking up the clods of earth, which afford harbourage for wireworm. When treated in this way, turf is one of the best rooting media obtainable. Those who have made the mistake of ploughing only once before cropping, can still do much to repair the error by ploughing again directly the harvest is gathered, then laying the ground open to the beneficial influences of frost, rain, and wind. *E. M.*

THE HOUSE SPARROW.

I CAN corroborate Mr. Stanbury's statements regarding house-sparrows clearing Gooseberry bushes of caterpillars. The first proof I had of it was some years ago, when I noticed that caterpillars were present on the bushes, but, owing to pressure of work, could not take measures to destroy them for a day or two. In the meantime I noticed that a lot of house-sparrows (not hedge-sparrows) were busy in the garden, and especially among the Gooseberry bushes. Thinking that they were causing mischief, I kept frightening them away, but they were soon back again, and on examining the bushes, I was surprised to find that the caterpillars had entirely disappeared. I have also noticed the same thing this season in the gardens here. *R. Simpson, Sewerby House Gardens, Bridlington.*

The Week's Work.

THE KITCHEN GARDEN

By J. DUNN, Foreman, Royal Gardens, Windsor.

LETUCES FOR WINTER SUPPLIES.—A sowing of hardy varieties of Lettuce should be made now, and another in ten days' time, so that supplies of this salad may be available throughout the winter. Sow on a south border and thin to 9 inches apart as soon as the plants are large enough, and if cold pits are available the seedlings which are removed from the rows in thinning may be carefully transplanted and the lights left off until late in autumn, when they should be replaced on the approach of heavy rains or frost. The bed should be within 18 inches of the glass and the soil light and rich. Maximum and Monument are fine varieties for this purpose, also Hardy White Cos.

HERBS.—Advantage should be taken of dry weather to cut Mint and other herbs intended for use in a dried state during the winter. Place them in a dry, open shed and allow them to become quite dry before bunching. In order to keep a supply of green shoots of the tender herb Sweet Basil during the winter a sowing should be made now and another a fortnight later. Grow the plants in a temperature of 60° and near to the glass. As soon as the seedlings are large enough to handle prick them into 6-inch pots, putting five or six plants in each pot, in light, rich soil, with plenty of sand. Sweet Marjoram should now be ready for potting into 6-inch pots, using loam and leaf-mould in equal parts; the compost should be pressed tightly about the roots and the plants placed in a cool pit or frame that can be ventilated freely. As the season advances they may be placed in a slightly heated pit and still ventilated in favourable weather.

TURNIPS.—Thin freely the winter turnips as soon as the plants are of sufficient size, to 4 inches between the plants, and hoe the ground frequently. Soot and wood ashes may be applied to the bed in showery weather. Turnip seed may still be sown in spare ground with a view to raising plants that will furnish green tops in spring.

ONIONS.—Spring sown Onions should be lifted as soon as the foliage begins to show signs of decay. Lay the bulbs thinly on clean, hard ground, and turn them daily until they are ready to be placed in the store. The crop should be carefully picked over, and only the hardest and best ripened bulbs stored for spring use. All thick-necked specimens may be used early in the season.

GLOBE ARTICHOKE.—As soon as this crop has been utilised the stems may be cut close to the ground and the ground hoed or dug, so that the plot may be free from weeds during the autumn.

GREEN CROPS.—The ground between the winter and spring greens should be hoed as soon as dry weather occurs. Make good all blanks in the rows. Continue to plant Coleworts, allowing the plants less space as time advances.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JAMES H. COLMAN, Bart., Gatton Park, Reigate.

MILTONIA VEXILLARIA.—*M. vexillaria* and its hybrids which flowered early in the season have started well into growth. Some will need repotting; but first each plant should be closely examined for thrips, which secrete themselves in the centre of the young growths and in the axils of the leaves. If thrips are found to be present, the leaves of the plants and growths should be immersed in a solution of Quassia extract, in the proportion of half a pint of extract to three gallons of tepid water. After dipping, the plants should be laid on their sides so as to allow the liquid to drain from the leaves without coming in contact with the roots or compost. Afterwards rinse in clear water. *M.*

vexillaria requires rather a shallow compost, the fibrous roots preferring to roam just under and over the surface. The compost should consist of *Osmunda* fibre cut up rather short. Remove all the small particles, and add small quantities of chopped Sphagnum-moss and crushed crocks. In repotting, keep the base of the young growths on a level with the rim of the pot, working the rooting materials in and around the roots moderately firmly. The cool house will suit them for the present, but when the nights become cooler, the plants should be removed to the intermediate house. They will be benefited by a light spraying overhead at least twice daily during bright weather. At first, and until the new growths begin to root freely, sprinkle the surface of the soil whenever it is dry; as the plant becomes re-established, the quantity of water should be increased. Spray them overhead every two weeks with Quassia extract, rather weaker than that recommended above for dipping.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DEXTER, Abbots Wood, Godalming, Surrey.

STRAWBERRY PLOTS.—These should be kept free from weeds and runners. The plants should be cared for in every possible way to ensure the ripening of the crowns for another season.

FIG TREES.—Continue to tie in these trees, tying in all growths that are not necessary for them well being. When large fruits are opening place muslin bags over them it wasps are troublesome, but this should not be done in wet weather, or it will cause the fruits to decay, and it should not be attempted until the fruits are approaching the ripening stage.

PEACHES AND NECTARINES.—When all the fruits have been taken from a tree, syringe it with clear water applied by the garden syringe or overhead syringe, thoroughly forcing the water on to both sides of the leaves. On the tree being dry wash it in the same manner with a dilute permanganate mixture. This will cleanse the foliage and kill all insect pests. The reason for employing clear water for the first application is that the foliage having been kept putridly dry for some time the first application of moisture entices the insects out of their hiding place, and hence they are trapped by the second application. Look carefully over all trees and see that they are loose enough to allow of the shoots swelling. Late varieties should have good supplies of farmyard manure or Leaf-Fertiliser. Expose the fruits as much as possible to the sun's rays, and keep all growths tied neatly and the laterals pinched out.

GENERAL WORK. Mark the trees that are to be not pruned, trees that are too vigorous to fruit well, and any that have to be kept in confined limits. All work of this kind should be planned when the trees are in active growth. After the removal of ripe fruits from wall trees give a good washing with some approved insecticide to cleanse the trees from insect pests. Marbled and other varieties of Cherries on north walls can be kept a long time if suitably covered with wasp-proof netting.

FRUITS UNDER GLASS.

By JAS. HUNTS, Head Gardener at Gumsbury House, Aston, W.

VINES IN BEARING.—Where only a few bulky ripe bunches are left upon vines, it will be well either to use them as soon as possible, or to cut them and place them in bottles in the Grape or Fruit room. Then the house can be suitably treated, both as regards watering the roots if the border be an inside one, and by thoroughly syringing daily to rid the vines of such insect pests as red spider and thrips. Give all such borders (as previously advised) one good dressing of a well proved artificial manure. Employ the first opportunity to thoroughly cleanse the Grape room and put it in readiness for receiving the late fruit. Such a room is extremely useful, not only for the Grapes, but also for Melons and Figs as they ripen. Keep the room as sweet and clean as possible.

FIGS: TRAINED TREES.—Figs of late varieties that are promising a good second or late crop should be kept on the warm side, for if a check is given them the leaves may turn yellow too soon, and some of the fruit fail to mature. Do not let any sappy or late growth continue; in fact, it will be better to keep all young shoots pinched. Water somewhat sparingly, giving only sufficient for the fruit, and not enough to excite root action and leaf growth.

OUTSIDE AND INSIDE VINE BORDERS AND RENOVATIONS.—September is a good season for giving attention to the renovation of vine borders. In many respects it is much better than the winter or spring periods. In fact, I prefer mid and late September to any other season for lifting the roots of vines from which the crop has been taken. It will be well, therefore, to look to the loam, and if the supply be at all short add some newly-cut turfy loam to it so as to secure a sufficient quantity. Let it be all broken down and well mixed together, adding both old mortar rubble and some nuts of charcoal, if this latter be still obtainable. Turn the mixture at least twice during next month, and cover it with a tarpaulin in rainy weather. A slight sprinkling of an artificial vine manure may be applied once during these turnings, but if used in excess it will be certain to cause injury.

THE FLOWER GARDEN.

By W. J. GRICE, Gardener to Mrs. DEMPFSTER, Keele Hall, Staffordshire.

PENTSTEMON.—Supports will now be needed for these plants, one to each. Encourage the lateral growths to throw up line spikes, by occasional waterings of liquid manure, soot-water, and a little fertiliser placed in the water-can, after the soil has been stirred with the flat hoe. During dry weather, clear water should be given in abundance.

PANSIES AND VIOLAS.—Unless the seed pods and faded flowers are constantly removed, the Pansies and Violas soon cease to flower. Cut off straggling growths, stir the soil lightly with a hand fork, and encourage the plants to continue flowering by giving them light dressings of some artificial fertiliser.

SPIRÆA. The late flowering plants that have served their purpose in the conservatory should not be discarded. Plant them 2 feet off at in reserve borders, and in two years they will make excellent specimens for decorative purposes.

LAVERNER.—Cut the flower spikes of Lavender before they are fully expanded, and place the flowers to dry on sheets of paper in a cool house or frame. By adopting this method the perfume will be retained for a long period. Bushes or hedges of Lavender may be trimmed at the present time with a sharp pair of shears.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcott, Eastwell Park, Kent.

FRANCOA RAMOSA.—As this plant passes out of bloom, a certain number of the best specimens in 4's and 3's should be potted into 24's and 16's. These will make large plants for greenhouse decoration next season, and will throw a large number of flower spikes. Seedling plants should be repotted, and if there is any scarcity the old plants can be split up, and healthy rooted pieces placed in medium-sized pots. Ordinary good potting soil will suffice. Keep the plants rather closer in a frame until they have got over the check, after which the lights may be withdrawn entirely. Francosas remain quite healthy if kept in a cool house or frame all winter.

CALADIUM. When Caladiums have completed their growth for the season, gradually acustom them to more air, after which they can be kept in the greenhouse or conservatory for a time. If the weather becomes dull and cold, care must be taken not to give them too much water. When the foliage begins to get shabby, return the plants to the warm end of the intermediate house. Expose them to the sun and reduce the water supply, preparatory to drying them off for the winter.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C. **Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

The Cabbage Maggot.

A very full and valuable account of the history and control of the Cabbage maggot (*Phorbia brassicae*) has been published by Mr. W. J. Schoene.* This pest, so well and so unfavourably known to British horticulturists, is now widely distributed over northern Europe, and also in Canada and the northern States of America.

The white eggs, about 1-25th of an inch in size, and marked by longitudinal furrows, are deposited by the fly near Cabbage or other Cruciferous plants. Within three to five days the larvae hatch out, and attack the collar and root of the plant. The larva, which matures in 18 or 20 days, is between one-third and a quarter of an inch in length. It enters the soil, where it pupates. The pupal stage may last from 12 to 18 days, or the stage may be prolonged for a long time—several months. Within a few days of their emerging the females begin to lay eggs. The adult fly may live for five or six weeks.

The insect hibernates in the pupal stage, and in that case the development is completed in the spring, when the adults emerge. Their appearance extends over a period of four or five weeks. In conditions favourable to the development of the insect three or even four broods are produced in a year; but inasmuch as the Cabbage maggot is essentially a northern insect, the hot weather of July and August is unfavourable to it.

It is important to remember that the insect not only attacks cultivated plants of the Cabbage tribe in the spring, but also feeds on Turnips and Cabbages in the autumn.

By the use of cheesecloth screens Cabbage seedlings may be protected from

attack, and tarred paper discs, described in these pages (April 28, 1917, p. 172), if put on immediately the plants are pricked out in their permanent quarters, suffice to prevent the larvae from gaining access to the roots. The pricked-out seedlings should have a certain clear length of stem so that the discs may be easily put in position, and the discs themselves should be just clear of the ground.

Among the food plants of the maggot are Cabbage, Cauliflower, Radish, Turnip, Swede, and Stock. Hedge Mustard (*Sisymbrium officinale*) and Common Winter Cress (*Barbarea vulgaris*) are also attacked. Mr. Schoene adds to this list Wild Mustard and all Cruciferous weeds, except, perhaps, *Brassica alba* and Shepherd's Purse.

The adult male insect is bristly, generally dark in colour, with grey markings; antennae black, three-jointed; wing veins brownish; legs black and bristly. The female is much lighter in colour; body and legs ash grey with a tinge of brown. The adults are about a quarter of an inch in length, but their size varies considerably. Some growers are of opinion that the fly prefers Radish to Cabbage, and plant the former as a trap-crop; but though this preference may exist, the trap-crop does not always succeed in attracting the insects to itself.

Experiments made with cheesecloth (20-30 threads to the inch) stretched tightly over frames and placed over the seed-bed show that attacks by the fly may be prevented, though, of course, the seed-bed must itself be free from the pupae. The cheesecloth screen is beneficial rather than detrimental to the growth of the plants.

HOW TO CAN TOMATOS.—The following recipe for canning Tomatos appears in one of our American contemporaries, the *Florist's Exchange*: "Select firm, well-formed Tomatos. Clean 1½ minute or until the skins loosen. Dip quickly into cold water. Peel, and remove stems and cores. Pack directly into cans or hot jars. Press down with a tablespoon (add no water). Add a level teaspoonful of salt per quart. Put the rubber rings and caps of jars into position but do not tighten fully. Seal tin cans completely. Place the packed containers on a false bottom in a vessel of water sufficiently deep to cover them by 1 inch and allow to remain at a boiling temperature for 22 minutes when using hot water bath canners."

RAINFALL AND GUNFIRE.—The popular view that the heavy gunfire in the west is the cause of abnormal rainfall is discussed* in a thorough manner by M. ANGER, the Director of the French Meteorological Service. After examining and condemning the various hypotheses put forward to support the view that gunfire begets rain, he turns to consider the question whether the rainfall of the past three years has any feature which requires to be accounted for by the invocation of a special agency. M. ANGER reaches the conclusion that it does not. We are having a run of bad luck—of wet years, which balance the run of dry years 1898-1905. In the dry spell 1903 and in the wet spell 1911 were exceptions and balance one another.

FRUITS IN SEASON.—MR. J. TRELOAR, ZOO-KEEPER to Mrs. W. BICKFORD SMITH, TREVARNO

Gardens, Sithney, Helston, Cornwall, sends us a bunch of Muscat of Alexandria Grapes remarkable for the size of the berries. They weigh just over one-half ounce each, and are well coloured, a quality not always well developed in extra large berries. It is a first-rate sample of this peerless Grape, and the grower is to be congratulated on his success; the bunches weigh from 1 lb. to 2½ lbs. each.

THE PRESERVATION OF FOOD.—MISS ETHEL M. CHAPMAN has compiled a valuable bulletin on the subject of food preservation.* From among the many useful hints the following may be mentioned:—After completing the bottling of fruits, etc., turn the jars upside down to make sure they are airtight. Sun preserved Strawberries.—Pick and preserve on a sunny day. Remove stalks, and put the berries in a single layer on shallow plates. Cover them with a syrup made of six cups of sugar (Miss CHAPMAN writes in Canada) to one cup of water. Cover the plate with a sheet of glass and set in the sun for eight hours. Pack in glass jars, cover with paraffin or parchment paper, and keep in a cool, dry place. Sauerkraut.—Shred Cabbage. Put a layer 3 inches deep in large jar or barrel. Cover with a layer of salt. Repeat till the jar is full. Fit a cover inside the jar or cask and weight it to force down the contents. The Cabbage will be cured in from 16-18 days at room temperature. Use 2½ lbs. of salt for 100 lbs. of Cabbage.

AGRICULTURE IN JAMAICA.—The annual report, 1916-17, of the Agricultural Department of Jamaica contains a useful record of work done, but its value is reduced by the inconvenient form in which it is published, and also by the absence of a table of contents. We would point out to those responsible for the publication of such reports that by changing the form from folio to a more handy quarto, and by replacing the general observations by a detailed table of contents the reports would be sure of a wider publicity than they at present enjoy. At the Hope Gardens experiments are being made in the cultivation of Uba sugar cane, a variety the introduction of which the late Lord KITCHENER—then Colonel KITCHENER—urged long ago.

PROTECTION OF WILD FERNS.—Devonshire, as is well known, is the home of choice wild Ferns, the indiscriminate uprooting of which in the past has seriously diminished their numbers, and in some cases threatened extinction. So serious has this menace become that it has been found necessary to protect the plants by legislation, and the removing of Ferns from private property is rigorously punished. A few days ago, at the Dawlish Petty Sessions, a visitor at Teignmouth was fined 15s. for digging up four Ferns. This sum was not intended to represent the value of the Ferns, but to be, as the chairman remarked, by way of a warning.

LOCAL SOCIETIES.—The Harlech Agricultural and Horticultural Show was held on August 6 in the grounds of the old Castle. There was a good collection of exhibits, and much of the produce was of high quality. The proceeds of the show was handed over to the Y.M.C.A.

—A successful flower show was held at Quarry Bank, Worcestershire, on August 8. The classes were well contested, and the number of exhibits was swelled by several very fine displays from local nurserymen, notably Messrs. E. WEBB AND SONS, Stourbridge. The exhibits were afterwards sold by auction, the proceeds being given to the local hospitals.

ASPLENIUM FILIX-FŒMINA VAR. CLARISSIMUM.

The illustration in fig. 30 shows the fine plant of *Asplenium* (*Athyrium*) *Filix-fœmina* var. *Clarissimum* exhibited by Mr. W. B. Cranfield at the meeting of the Royal Horticultural Society on Tuesday, July 31 last, when the Floral Committee made the award of a Cultural Commendation. The plant is a portion of the original Fern discovered as a wildling by Mr. B. Moule in North Devon in 1863, and has a classic interest in that the phenomenon of apospory was discovered by the late Mr. C. T. Drury on its fronds. It is one of the most beautiful varieties of the Lady Fern, which is among the most attractive members of our native flora.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See also Tables in *Gardeners' Chronicle* for July 23.)

(Continued from p. 68.)

5—ENGLAND, S

BERKSHIRE.—The fruit crops in this neighbourhood are much above the average, and Apples, small fruits, Nuts and Walnuts are bearing heavy crops. Wall trees are very free from insect pests. The orchard trees have been attacked by caterpillars, but the recent rains have almost cleared them. The soil here is a light loam on a gravelly subsoil. *J. Howard, Babam Palace Gardens, Newbury.*

DORSETSHIRE.—The fruit crops here are well up to the average. We have had no late frosts to do any material damage, and so far an absence of serious sea fogs, which are generally disastrous. Plums are very plentiful. The soil is of an ironstone, sandy loam. *H. Kempshall, Abbotsbury Castle Gardens.*

—Apples and Pears blossomed well, though much fruit has dropped, and there is a good crop of Apples. Pears on walls are also bearing heavily. Strawberries blossomed well, but the dry weather made the fruit small, the rain coming too late. Peaches are showing a good crop, and Apricots fair. Bush fruit is in abundance, and of excellent quality, except Raspberries, the canes being much damaged by the severe frosts of last winter; but the quality of the fruit is very good. Morello Cherries are carrying a good crop, and Figs are looking very promising, in spite of the severe winter, although the trees had no protect on. The soil is fairly stiff, though shallow, with a chalk subsoil. *J. Jaques, Brimston Gardens, Blandford.*

—The fruit crops here are the best for many years, the only light crops being Gooseberries and Strawberries. The latter were affected by the dry weather, although, for the first fortnight after the season commenced, Royal Sovereign was good. The Apple crop is very good, and the Pear crop even better. Of Plums, Rivers' Early Prolific, Czar and Victoria set in such clusters as to require severe thinning. Trees of all stone fruits are clean and healthy. Both Sweet and Morello Cherries, Peaches and Nectarines, are very good, but the windy weather in April made a failure of the Apricot crop, and a partial failure of the Gooseberries. Red, White, and Black Currants, Raspberries and Loganberries produced heavy crops of fine berries. All kinds of Nuts are very plentiful. *P. Barton, Coth. Gardens, Sherborne.*

—Apples are heavily cropped, and promise to be very good. There are not many insect pests, but many trees are attacked by brown rot disease. Pears are very good, and the fruit clean; Plums and Damsons are carrying heavy crops; Cherries, both Sweet and Morello, cropped

freely. In very few seasons the crops all round have promised better than at present. *Thos. Denny, Down House Gardens, Blandford.*

HAMPSHIRE.—All the fruit trees in this part blossomed well, and an abundance of fruits is seen everywhere. There was no late frost to injure the flowers. All trees look remarkably healthy and quite free from aphids. Our soil is heavy, and the subsoil is clay. *H. Martin, Beatty Lodge Gardens, Cadnam.*

—The fruit crop generally promises to be one of the best for some years. The trees benefited from the rather light crops of last year, and were enabled to make some good wood. The late spring kept the flowering period back, until danger from spring frosts was nearly past, consequently the fruit had every encouragement from the beginning. Strawberries were a light crop generally, owing to drought at the ripening stage; the fruit ripened quickly and was soon over. Apples, Pears and Plums are carrying very heavy crops, and the rains have

numbers of Apples and Pears to drop; since rains have fallen those that remain have swelled rapidly. Most of the crops are clean and healthy and promise to be well up to the average in quality; Raspberries and Gooseberries have been exceptionally good. Caterpillars have given more trouble than aphids. The soil is a heavy loam on a chalky subsoil. *T. Gimson, Borden House Gardens, Petersfield.*

KENT.—The fruit crops in this district are very good, especially Apples, Pears, Plums, Peaches, Nectarines and Sweet Cherries. Strawberries, Raspberries, and all bush fruits have been very satisfactory. The heavy rains did much good on our chalky soil. *J. T. Shann, Bettshanger Park Gardens, Eastre.*
—The show of blossom on Apple trees was exceptional, but late frosts caught certain varieties, notably Peasgood's Nonesuch and Gascoyne's Scarlet Seedling, and few fruits set. Cox's Orange Pippin and Baummann's Red Winter Reinette, however, promise fine crops. Straw-

FIG. 30.—ASPLENIUM (ATHYRIUM) FILIX-FŒMINA VAR. CLARISSIMUM.

helped to open the fruits. *Leone Smith, Cold Pond Park Gardens.*

—Apple trees are bearing large crops. They have escaped caterpillar pests and scab; they are now making growth freely, and the fruit is swelling. Cox's Orange Pippin, Worcester Pearmain, Lady Sudeley, James Grieve, Abington Pippin, and Devonshire Quarrenden are the best in the dessert section. Among kitchen sorts Bramley's Seedling, Lord Grosvenor, Grenadier, Mere de Menage, Lane's Prince Albert and Norfolk Beauty are the more conspicuous. Plums are heavily cropped, standard trees of Rivers' Prolific, The Czar, Victoria, Monarch, Jefferson, Perry's Seedling and Belle de Louvain, also the Merryweather Damson, are bearing exceedingly well. Cherries were of excellent quality. Peaches and Nectarines are very clean in foliage and fruit. Strawberries, owing to the drought in June, were not so good as usual. The soil is heavy in texture. *E. Molyneux, Swinmore Park, Bishops Waltham.*

—The fruit crops early in the season promised to be excellent, but dry weather caused

berries were good, considering the season, and Raspberries yielded a phenomenal crop. *C. E. Shaw, The Elm, Foots Cray.*

In this district Apples have dropped very badly, and the crop will probably be of meagre dimensions. Sprayed and unsprayed trees have alike suffered. *Geo. Fennell, Bowden, Tonbridge.*

—Apples are looking extremely well, and the foliage and growth are clean and healthy. The trees flowered exceptionally well during good weather; plenty of fruit set, and though a quantity has fallen off there is every prospect of a heavy crop. Pears are also clean and healthy, and looking promising. Apricots and Peaches are carrying the best crops seen for years. Small fruits generally are good. Strawberries were very early, but yielded a lighter crop than usual; this is attributed to the dry weather during May and June. Though small, the berries were excellent in flavour. *J. G. Weston, Eastwell Park Gardens, Ashford.*

In Mid-Kent the fruit crop is, generally speaking, entirely dependent this year on the

presence or absence of caterpillar. Clean orchards have crops rather over the average, those neglected are in many cases bare. The value of spraying early with lead arsenate was never more evident. *E. A. Bunyard, Royal Nurseries, Maidstone.*

MIDDESEX. Apples and Pears were late in flowering. Both set freely, but Apples have dropped somewhat more than usual. The fruits are, however, swelling freely. Peaches and Nectarines were also late. These have set well, and aphid has given very little trouble. Small fruits carried heavy crops, especially Currants and Raspberries. Strawberries were earlier than usual in ripening. The soil is a light loam resting on gravel, which overlies the London clay. There was no frost during the last week in May. *James Hudson, Gammersbury House Gardens, Acton.*

—On the whole, the Apple crop is good, and in some places above the average. Pears and Plums appear to be good, and yielding heavy crops. Victoria and Prince of Wales Plums are particularly good. Gooseberries are remarkably free from American Gooseberry mildew. Wall fruits, especially Peaches, Nectarines and Apricots, are much better than in previous years, having escaped the spring frosts. *John Weathers, Park View, Isleworth.*

(To be continued.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

"THE CHRONICLE."—I have been for a holiday on Deeside, and have not seen the *Gardeners' Chronicle* for three weeks until to-day. I soon, however, brought my reading of it up to date. I note that the price has been increased by one penny, and if I am surprised, my surprise is that the increase is so small, for I know well the increased cost of everything connected with printing. One concrete example: Paper for 120,000 copies of my firm's catalogue cost before the war between £800 and £900, now it costs for the same quantity over £5,200! Paper to print the *Chronicle* must have risen in like proportion. I am sure you have, in the interests of the paper and of horticulture, adopted the best policy by deciding to keep up the high standard of the paper. Some thirty years ago I spent a Sunday with the late E. S. Dodwell, at Oxford, and I remember as it were yesterday what he said of the *Chronicle*. "The combination of what is best in practical horticulture with what is best in scientific horticulture makes its position supreme; it is like a thoroughbred, well-trained racehorse." I thought it a strange simile, and said so. Mr. Dodwell added, "The care bestowed on a racer suggests to me the care that must be bestowed on the production of the *Gardeners' Chronicle* week by week." Speaking of a fine old gardener and gentleman like Mr. Dodwell, let me tell you of another whom I met last week, James Bezz, who was for fifty years gardener to Sir Robert Jardine at Lanrick Castle, Doune. Mr. Bezz, who is in his 87th year, and has been living with his sister in retirement at Boyndie Cottage, Culter, Aberdeenshire, for a number of years, is still hale and hearty. He was a noted man in his day, a fine grower of Grapes and Peaches, and vegetables too. I remember he gained a number of prizes at the International Show in Edinburgh. Nearly all his old contemporaries are gone; he speaks of Donald McBean, Ned Glass, Tom Hoag, great gardeners all; of John Downie, George Goodall, Alexander, and Dicksons and Co., and James Gray, too, almost the only one left, he said; Palfie Methven, James Dobbie, and others. He talked to me as if I was only a boy! Mr. Bezz still does his own garden, and his Potatoes I have not seen this year, some half dozen varieties, splendidly grown, and kept standing erect, 5 feet high, by lines of coarse rope stretched along each side of the rows. He still writes well, this old gardener and gentleman of 87. He reads, too, and is interested in many things, particularly his little kirk, which has sent more than one

noted man out to make his mark in the great world. He is very proud of his present minister, who is doing his bit in France—Captain Somerville, son of the late Rev. David Somerville, D.D., one of the most sympathetic and scholarly men it was ever my lot to meet. *W. Cuthbertson, V.M.H., Edinburgh.*

INTENSIVE CULTIVATION.—Mr. Brotherton observes that in the article he quotes from the *Scotsman* the need for deep cultivation was not emphasised. I am of opinion that very deep cultivation is not desirable for cereal crops. Wheat, Oats, and Barley require a firm base. Deep cultivation, while producing more straw, would diminish the quality of the corn. I have often noticed that when a drain has been cut across a Wheat field, or a ditch filled up, the straw growing on such sites is always several inches taller and of a deeper green than that in the rest of the field, but the grain is lacking in quantity and quality. It is the same with soil on which a manure heap has lain. In growing Onions, on the contrary, especially of the Ailsa Craig type, too much manure cannot well be employed. I have seen it dug into the ground annually 2 feet thick with perfectly successful results. As regards the cropping of vines, I support Mr. Brotherton's views. The vines I planted here forty years ago produced crops this year equal to any during previous years. Change of cropping may be an advantage, but it is not a necessity, as some would have us believe. I have seen much evidence to the contrary in the case of many crops, including Potatoes. *E. Molyneux, Sycamore Farm, Bishop's Waltham.*

PRICES OF VEGETABLES AND FRUITS.—The establishment everywhere of allotments, and the consequent enormous increase in the quantity of food produced in this country, was expected to have the effect of lowering prices. This expectation, except in the cases of Potatoes and Vegetable Marrows, does not seem to have been realised, at any rate, in London. Peas have been expensive all through the season, the lowest price being 3d. or 4d. a pound. From 3d. to 4d. is still asked for a single Cabbage, and Lettuces are correspondingly dear. Fruit has also been very expensive. Strawberries, Cherries and Gooseberries having all been sold over a long period at 8d. to 10d. a pound. Part of the trouble is no doubt due to shortage of transit facilities, though there is a good deal of waste in this direction, notably on the part of Government authorities. A flagrant case in point was reported a short time ago by Dr. D. L. Thomas, Medical Officer of Health for the borough of Stepney, who stated that 15,000 bags of rotten Potatoes and unsound margarine, which arrived at Harwich from a Dutch port, in a condition totally unfit for consumption, instead of being destroyed on the spot, or dumped into the sea, were loaded on to a hundred and twenty-one railway trucks, and sent to Bishopsgate Station. It would be difficult to find a better example of the victory of red tape over common sense. *W. T.*

RENOVATING A VINE BORDER.—May I ask why Mr. Kidd (see p. 46) does not remove all the soil from the unsatisfactory border? The idea of adding fresh soil annually is good, but what is to prevent some of the young roots from going down into the old, inert mass of soil underneath? I have seen sand stones on vine borders, but have yet to learn their utility. Considering the time taken to collect and cart the stones, move them, and replace annually, where is the saving of labour in watering? *J. Bates, Marford Gardens, Stone.*

TEA PLANTS.—Prof. Henry's note (p. 67) on Tea plants is very interesting. The Assam variety is certainly more tender than the Chinese variety. I have tried several times to establish the plant in these gardens from specimens generously supplied me by a friend near Newbury, Berkshire, but it will not survive even a little frost. This year I had five small plants in the open; the largest was about 2 feet high, and made fine, large, healthy leaves, but cold winds blasted them so badly they all eventually died. The ordinary Chinese form, however, has not suffered

in the least. We have also another variety which seems to be intermediate between the Assam and Chinese varieties, both in size and hardness. This plant suffered badly last winter, but is still alive, and has started growing again. Perhaps Prof. Henry would like specimens, and I will gladly send him a leaf or two. I quite agree with Mr. Lynch, that it is useless to attempt to grow the plant in a pot, as it never makes roots, and eventually collapses altogether. Cuttings of the Assam variety strike fairly freely. *H. Kempshall, Abbotsbury Gardens, Dorchester, Dorset.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

August 14.—*President*, Mr. E. A. Bowles, M.A., (in the chair), Sir Everard in Thurn, Messrs. H. J. Elwes, J. Fraser, W. G. Baker, J. W. Odell, and F. J. Chittenden (hon. secretary).

The late Mr. C. T. Drury, V.M.H.—Mr. Bowles referred to the loss the Committee had sustained in the death of Mr. C. T. Drury, who had for many years been a member of the Committee. It was unanimously agreed that a vote of condolence be sent to his relatives, with an expression of the Committee's appreciation of the work Mr. Drury had done in furthering a knowledge of our native Ferns and in the discovery of aspidogy.

Various Plants.—Mr. Elwes exhibited a number of plants from his garden, including *Allium micranthum*, a species which he had collected 35 years before in Sikkim; *A. Wallichianum*, an almost stoloniferous species with a singularly compressed and winged stem, also from Sikkim; a woolly species of *Delphinium* from Kashmir; *Zeyheranthus candida* major; a species of *Halimolobos* from the Argentine with a jointed bulb; *Glabidium Papilio*, and others.

Potato Black-leg.—Mr. Odell showed specimens of Potatoes affected by the bacterial disease called black leg, which seems to be rather more prevalent than usual this year. The most marked symptom is the presence of dark patches in the vascular bundles when they are cut across near the base of the stem owing to the vessels being filled with bacteria. Such plants should be lifted at once and their produce should not be used for seed next season.

Ants and Lily Flowers.—Mr. Bowles showed buds of *Lilium sulphureum* from Mr. Fletcher, of Aldwick Manor, Bognor, which had been damaged by ants in the same way as had those which came from Norwich recently. A further communication concerning the latter from Dr. C. A. P. Osborne, from whose garden they came, pointed out that the buds attacked in many cases failed to open properly, but split across one or more of the petals, while in others the edges of the petals were damaged. It would be of interest to learn whether other species besides regale and sulphureum are attacked by ants in this manner.

Raspberry Canker.—Some canes of Raspberry attacked by a species of *Coniophyium* allied to or identical with the one which causes canker in Roses came from Mr. Beresford, of Prestbury, Cheshire. The bark was split and a considerable amount of corrugated growth had developed on the edges of the wounds. This growth was soft in character, and had dried up to some extent in the specimens sent. A similar complaint had occurred some years ago on Chinese Brambles at Wisley, but had not spread, so that cutting out the diseased canes will probably prove an effective check upon the disease.

SCOTTISH HORTICULTURAL.

August 7.—The monthly meeting of this Association was held at 5, St. Andrew Square, Edinburgh, on this date, Mr. Phillips, the president, in the chair.

A paper by Mr. James Gibson, Welbeck Abbey Gardens, Worsop, on "Vegetable Growing for Present-day Requirements," was read by the Secretary. The war, Mr. Gibson said, had revolutionised our methods of cultivation. No one had rendered a greater service to the country than the gardener, and in this crisis, instead of being faced with a vegetable famine, we were

now enjoying an ample supply of everything the garden could produce. But owing to shortage of labour and other causes, old methods had to be abandoned, and in every garden of ample enough dimensions the plough, although an inferior implement of cultivation to the spade, must of necessity find a place. The paper dealt in detail with the cultivation of the leading kinds of vegetables.

Messrs. DOBBIE and Co., Edinburgh, exhibited a collection of Radishes and the hybrid Tea Rosses. Mrs. Wemyss Quinn and H. V. Machin, and Mr. F. BAILLIE, Eden Garden, Liberton, exhibited new varieties of Ox-eye Daisies.

Obituary.

A. GALT.—We regret to record the death, on August 5, of Mr. A. Galt, for 45 years gardener at Aldermaston Court, Berkshire. Mr. Galt was a native of Perthshire, and 77 years of age. During his gardening career, which was commenced at an early age, he was engaged successively at Drummond Castle, Kew Gardens, Royal Agricultural College, Cirencester, Wivenhoe Park, Essex, and Aldermaston Court, Reading. During his long period at Aldermaston he served under four employers, including the present owner, Mr. C. E. Keyser. Mr. Galt was a skilful craftsman and gained many prizes at London and local shows. He was held in high esteem by all who knew him, a fine, upstanding man of venerable appearance and high character. The gardens at Aldermaston were largely laid out under his supervision, and the principal features were described and illustrated in *Gard. Chron.*, December 4, 1915. Deceased lost one son in the early period of the war, and another is now in France. A third son, Mr. A. S. Galt, holds an appointment in the University of Leeds. The funeral took place at the parish churchyard on the 10th inst., Mr. Keyser and members of his family being present.

ALEXANDER MACVINISH.—We learn with deep regret that Mr. Alexander MacVinish died, at the Gardens, Beau Manor Park, Loughborough, Leicestershire, on the 15th inst., aged 62 years. He was gardener to the late Mrs. Perry Herrick, and W. H. Curzon Herrick for the past 10 years. Previously he was gardener for a period of 13 years to N. Curzon, Esq., Lockington Hall, Derby. Mr. MacVinish was a skilful cultivator of fruits, flowers, and vegetables, both under glass and in the open, and judged at the Leicester, Nottingham, and local shows. He was connected with the Loughborough Chrysanthemum and Mutual Improvement Association, and the Woodhouse Leaves Horticultural Society. His remains were interred on the 15th inst. in the beautiful churchyard of St. Mary's, Woodhouse, where, within the last two years, three of his sons have been laid to rest. There was a large assembly of friends and associates present, including W. H. Curzon, Esq., and his mother, Mrs. King. Deceased leaves a widow, two sons, and two daughters.

M. PAUL HARIOT. We learn with regret of the death of M. Paul Hariot, a well-known worker in French horticulture, in his 63rd year, and the author of some important books, one of the best known in this country being *Livre d'Or des Roses*. For over thirty years he was and was a member of the National Horticultural Society of France, and held the post of honorary assistant librarian. He was also Assistant de Cryptogamie at the Museum of Natural History, and secretary of the Society of Vegetable Pathology of France. He was a Chevalier of the Mérite Agricole and an officer of the public instruction. For some years past he had suffered from a serious malady.

PLANTS AND SEEDS LIST, PERADENYA.—We have received the 1916-17 list of plants and seeds offered for sale by the Department of Agriculture, Ceylon. It includes shade and foliage trees, flowering shrubs, ornamental shrubs and perennials, ornamental climbers, plants, and fruit trees. The list has been compiled by Mr. T. H. Parsons, the curator, and is published by H. M. Richards, Colombo, Ceylon.

CROPS AND STOCK ON THE HOME FARM.

HARVESTING VETCHES FOR SEED.

THE scarcity of good seed of Vetch, owing mainly to the severe wintry weather, is keenly felt this season. Where even half an acre can be harvested the grower will reap the benefit later on, as seed is sure to be scarce and dear. To the sheep farmer, both winter and spring Vetches are indispensable as food for stock from May to September, especially where lambs are fattened, or ewe lambs kept for stock. Green Vetches, too, are also appreciated by cows, horses, and pigs. No time should be lost in cutting the crop. The pods near the base are the most valuable, as they contain the best seed. It is useless trying to save all the pods on the haulm, those near the top do not mature before those at the base become too ripe. A sickle and a short hooked stick are the best tools for harvesting this crop; it should be cut into small heaps or grips, which are easily turned with a long-handled prong. If the weather remains dry after cutting until the seed becomes hard, one turning will suffice, but in showery weather it will be necessary to turn the haulm several times, though it should not be forgotten that the oftener it is turned the more risk there is of the seed "bitting". When thoroughly hard, either thrash direct from the field or cart the crop into a rick, to be threshed when required for sowing during September or October for the early feed, or in the spring for a succession.

TRIFOLIUM INCARNATUM.

This Clover is commonly known as the Italian Crimson Clover. This and the late white variety provide one of the most valuable spring feeding crops. Horses, cows, pigs and sheep all thrive on it. An acre when well grown furnishes much excellent food. The middle of August is a good time to sow the seed, which is usually done on a clean stubble of Wheat or Oats. If the sowing is deferred much beyond that period slugs are apt to be troublesome to the weakly plants in October. The advantage of early sowing enables the plant to obtain a firm root hold of the soil, and it is better able to withstand excessive rains and autumn frosts.

Directly the corn is cleared thoroughly, scratch the surface to bury the seed. Where the soil is high, heavy harrows or drags will suffice; where it is stiff, with a baked surface, a cultivator will be necessary to crack the crust. Ploughing the land is seldom practised, as Trifolium prefers a firmer rooting base than can be had by ploughing. The bulk of the long stubble after cultivating would be better cleared off, as too much is liable to harbour slugs.

With the land seed harvest sow 25 lbs. of seed per acre. Late white Clover provides a serviceable succession to the early red variety. After sowing draw fine-toothed harrows over the ground twice, and should the weather be dry, roll the whole firmly. *E. Molyneux*

Pigs.

Instead of being fed largely on cereals, as they were before the war, pigs in England must now be reared mainly on such things as grass, roots, silage, coarse milling offals, fishmeal, dried yeast and grains, malt culms, offbees, and waste products like wherf and household refuse. Even before the war, Mr. F. S. Edge and others had shown that pigs could be reared more healthily and profitably on the open-air system than in sties. The out-door system results in a great saving of meal; breeding sows kept on this method are more prolific and much harder than sty-kept sows; and their young are bigger and more vigorous than pigs bred in sties. Practically all pigs may with advantage in these times be turned out from April to October. Pig sows and gilts turned out to pasture from April to October need only a very little concentrated food—indeed, on good grass, they may do without any concentrated food at all. Obviously they should be ringed before being run on pastures, or folded there, or they may disturb the turf. Hurdles make a good fold, and a length of barbed wire fixed close to the ground will prevent pigs from nosing under any fence;

two strands of barbed wire fixed respectively six and fifteen inches from the ground should keep in any pig. Store pigs from ten weeks and up wards may be relied upon to find most of their food out of doors, if given a fairly large run.

ENQUIRIES.

CLEMATIC.—Can anyone tell me what is the earliest date on which Clematic can be sown without risk of bolting next season? Being hardy, it should stand some frost. *H. E. D.*

SUGAR BEET.—Having grown a few rows of Sugar Beet, I should be grateful to any reader who will advise me what is best to be done with the crop. If I merely boil the roots and mix with jam the proportion of Beet to jam, it is said, must be about one half. How can I get rid of the earthy taste in the roots? Can I prepare a syrup from them? Will someone give me the address of a Beet sugar factory? *H. M.*

Will a reader be good enough to give me a rough-and-ready method of curing and preparing Tobacco; also the proper time or appearance of plants to harvest them? I have no curing shed, but simply an airy room, the temperature of which could be regulated by the windows. I am growing a few common Virginia plants as an experiment, and shall be glad of any hints to make them a success. How long should the leaves be kept before using, and does the flavour depend on the time they are stored? *Verice, Ireland.*

ANSWERS TO CORRESPONDENTS.

Correspondents are asked to note that in sending Priches or Scutellums for identification it is necessary to send also a shoot from the tree, bearing leaves, as the glands at the bases of the leaves assist in determining the varieties. It is also a help if it can be stated whether the tree bears large or small blossoms; the difference between the different varieties in this respect is very marked. It should also be noted that the fruits will be crushed, however well packed, if they are fully ripe when gathered. Two specimens of each variety should be sent.

AMOUNT OF LABOUR FOR 1½ ACRES.—*W. P. Devine, Westminster.* To keep 1½ acres of kitchen garden well stocked and in order would require the labour of one man of average capabilities from 5 to 4 days a week, according to the nature of the soil.

BOOKS.—*C. G. A. Thomas, The Fruit Garden*, by Geo. Bunyard and Owen Thomas, price 15s.; *Apples and Pears*, by Geo. Bunyard, 1s. 10d.; both, post free, can be obtained from our publishing department.

BONGAINVILLEA GLABRA.—*M. L. V. Bongainvilleas* are among the most freely flowering of pillar plants, and we are surprised that you should have found yours so shy. You state that your specimen is growing on the wall of the conservatory—perhaps this is the "back wall," against which the roof is built, in which case it may not be sufficiently exposed to the sun. Moreover, you have made a mistake in drawing a blind over the glass on very sunny days, as no sunshine in this country is too strong for this plant. It will grow and flower best if permitted to climb right to the top of the conservatory, so that there is nothing between it and the glass roof. Severe cutting in winter is correct practice, and thinning out the growths if they become too thick, so as to allow the sunlight to reach each individual growth. The *Bongainvillea* flowers well enough in a cool conservatory, but blossoms rather earlier and better if the structure be slightly heated in the winter. Do not keep the plant too dry in the winter, especially if the house be heated.

CABBAGE ROOT MAGGOTS.—*H. E.* See leading article on p. 30.

COLOR ARRANGEMENT.—*M. B.* The best book on the subject is *Colour Schemes for the Flower Garden*, by Gertrude Jekyll, price 15s., post free, from our publishing department.

FLOWERS IN AN UNHEATED GREENHOUSE: *Winter Flowers.* To produce flowers for button holes during the winter months taxes the skill of the grower, even when a heated greenhouse is available. Having only an unheated greenhouse, you will find the difficulties are increased. Suitable plants should be prepared during the spring and summer, so that by the time they are required to flower they are well ripened and matured. It is much too late to sow seeds of plants that would likely be of service this coming winter, but good plants of Violets could be potted up in September, also such subjects as Lily-of-the-valley, Freesias, and Roman Hyacinths. These would flower from November onwards, but, of course, much would depend on the weather, and also whether the roof-glass can be covered up at night. Perpetual-flowering Carnations, Bouvardias, double white and other Primulas, Cyclamens, Zonal Pelargoniums, Heliotropium, and Cineraria stellata, also annuals sown in pots now, such as Mignonette, Stocks, and Clarkias, would flower in the late spring, and would be the best things to grow, unless the plants named above can be procured, and prepared ready for flowering in the winter.

IMPROVED RUNNER BEAN: *R. C. P.* The next meeting of the Royal Horticultural Society is fixed for Tuesday, the 26th inst., in the Drill Hall of the London Scottish Volunteers, Buckingham Gate, Westminster. The Beans should be addressed to the Secretary, Royal Horticultural Hall, Vincent Square, Westminster, and should be entered to go before the Fruit and Vegetable Committee. It is unlikely that an award will be made, but if considered of exceptional merit you would probably be asked to send seeds for trial next season to Wisley Gardens, where the varieties' merits would be decided in comparison with existing sorts, and, if superior, an award made.

LISIANTHUS RUSSELLIANUS: *C. J. E.* The correct name is *Eustoma russellianum*. It is a well-known garden plant, and, in former times, when stove plants were more popular than now, was extensively grown. It is best treated as a biennial, the seeds being sown one year and the plants flowered the next. Do as you suggest, and exhibit a batch in flower at one of the R.H.S. fortnightly meetings. We can find no record of the plant having been certificated by that Society.

NAME OF PLANT: *R. J. H., Cork.* *Tenarium fruticosum*, Linnaeus, sometimes named *T. latifolium*.

PEACH LEAVES INHURED: *H. W. J.* There is no fungus at the spots in the Peach leaves. The injury resembles that caused by "scorching" rather than any insect or fungous disease.

PLOUGHING OF PASTURE LAND: *E. M. C.* No matter what crop is to be grown, the land should be ploughed forthwith, not more than 5 inches deep, thoroughly burying the grass by the aid of the skine counter on the plough. The object is to get the turf rotted thoroughly as early as possible. By ploughing at once you would have the opportunity to dig again ploughing during the winter several times, the third time deeper to thoroughly disintegrate the turf and soil, and thus make the whole ground in a better condition for the spring crops. Where the soil is deepest plant early Potatoes, and in other parts Cabbages, Vegetable Marrows (the bush or dwarf varieties), Brussels Sprouts, Curled Kale, and Savoy. Parsley should also succeed. Apples should be successful, especially strong growing varieties, such as Bramley's Seedling, Grenadier, Lord Grosvenor, Norfolk Beauty, Worcester Pearmain, and Ben's Red. The trees should be standards, planted 25 feet apart, with Strawberries, Gooseberries, and Red Currants below. If the site is much exposed to south-west winds, substitute bush trees for the standards. If animal manure is not available apply basic slag at the rate of 3 cwt. per acre, not later than November, say before the second ploughing. In the spring apply high-grade superphosphate at the rate of 5 cwt. per acre. For the vegetable crops give occasionally dressings of sulphate of ammonia at the rate of 1 cwt. per acre. It is

against our practice to recommend individual firms; scan our advertisement pages.

PLUMS: *C. H.* The Plums are attacked by brown rot *Monilia fructigena* and *M. cinerea* are both present. As you refer to two trees only affected, it should be possible to remove all the affected fruits at once and destroy them by burning. In any case, to reduce the amount of infection next year, no diseased Plums (i.e., mummified fruit) should be allowed to remain on the tree throughout the winter, and all dead twigs and branches should be cut out.

PRIVET IN TOPIARY SHAPES: *J., Radlett. The Book of Topiary*, by Curtis and Gibson, price 2s. 10d., post free, from our publishing department, would be of service to you.

PRUNING BOX HEDGES: *C. C.* The best time to clip evergreen hedges is in the spring and early summer, when growth is quickest, and the new leaves push forth almost immediately, filling up any spaces caused by the cutting. In the case of the Box, however, this is not so important as, for instance, with the Laurel, which has very large leaves, and there will be no harm in your taking the opportunity of a little available labour now to clip the hedge in question.

RUNNER BEANS FAILING TO SET PODS: *B. Y.* It is characteristic of the Runner Bean to fail to set the earliest blooms at the base of the plant, but after making more growth and gaining vigour the pods develop satisfactorily. You will doubtless, therefore, have a good crop as the season develops. The trouble is more pronounced in dry seasons; indeed, it is seldom that a satisfactory crop of Beans is produced when the roots are suffering from drought. If your plants are in a dry situation, such as at the base of a wall or fence, drought may be the cause of failure, in which case a good watering would doubtless rectify matters.

TOMATOS: *Constant Reader.* To grow Tomatos on the double stem system, pinch out the growing points when four to six leaves have been made beyond the seed-leaves. Being stopped too early has a crippling effect on the little plants, because they have few roots and not much stamina. Most Tomato seedlings "break" naturally sooner or later if grown strongly, but pinching hastens matters and gives more uniformity of growth. Additional side shoots are removed. Either system can be adopted for market work, whether the plants are grown in pots or in borders. The following are reliable sorts for such a purpose, and will respond to either method of training: *Sunrise*, *Masterpiece*, *Kondin*, *Red Duke* of York, *Best of All*, *Money-maker*.

VARIOUS QUERIES: *E. B.* The plants of *Richardia* (Arum Lily) and *Azalea* should be brought under glass in the autumn before frost occurs. By that time the growth should be well ripened, and the plants in a good condition for flowering, the time of which may be regulated by the degree of warmth to which they are subjected. Now is a suitable time to insert cuttings of both Zonal-leaved and Ivy-leaved Pelargoniums. Choose well-ripened, stout shoots for cuttings, with relatively short internodes. They should be cut below a joint, i.e., the part immediately underneath a leaf, the stipules and a few of the lower leaves removed and inserted in soil containing plenty of sand. They may be struck in pots, pans, or boxes, and the receptacles should be provided with plenty of drainage to allow surplus water to pass away freely. The *Lilium* is probably *L. martagon*, but this could only be determined by us if we received a specimen. With regard to the neglected Plum trees on walls, you would be well advised to train in some of the young shoots to take the place of any that are worn out. The majority of the older shoots should be pruned hard back to induce spurs to form. Apples are ready for gathering when they part readily at the stalk, which may be determined by lifting the fruits gently upwards. The condition of the pips is also a good indication. When ripe they are dark

brown, almost black. The only method of preventing squirrels from taking the nuts is to place a net over the bushes.

VEGETABLES: *Old Reader, Sheffield.* To obtain a constant supply of vegetables all the year round for 60 adult persons you would require 8 to 10 acres of ground, 30 tons of manure, and the labour of four to six men, according to requirements. One acre should be planted with early Potatoes, and 2½ to 3 acres with late varieties. Much would depend on the nature of the soil, the details of management, proper rotation of the crops, and the practice of inter-cropping. A certain amount of glass structure, such as pits and frames, is necessary for successful kitchen gardening.

WEIGHING AND MEASURING MILK: *J. A. A.* A pint of milk weighs 1½ lb., and a quart 2½ lbs., and a gallon 10 lbs. The Sandringham recorder is a spring balance on a tripod, intended to stand in the cow house, which weighs or measures the milk as taken from the cows. It can be obtained from any dairy supply company. It is not customary to feed Lettuces to cows, but it should do no harm. Maize and Cabbage are both valuable for milk production, the former especially in August, September, and October, and the latter during the following months.

WHITE FRUITED WHORTLEBERRY: *J. M. C.* The white-fruited variety of *Vaccinium Myrtillus* is seldom seen on account of its rarity in the wild state, and the difficulty of cultivating it in gardens. It was known in ancient times, however, for it is mentioned by D. Rembert Dodoeus in 1578. Describing "*Vaccinia nigra*" (Black Whortles or Whortel Berries), he says: "Of this sort there are founde some that beare white Berries when they be ripe, howbeit they are but seldome seene." London records it in his *Encyclopaedia of Plants* (1829), under the name of *V. Myrtillus fructu albo*, and states that it is a native of Britain on moors. Normally the flowers are pale yellow-green tinted with rosy-red, but this variety had green flowers, and white fruits. When writing a description of *V. Myrtillus* for his *Arboretum et Fruticetum Britannicum* on June 6, 1836, he was visited by Mr. John Booth of the Blackbeck Nursery, near Hamburg, who stated that a patch of 154 plants of the white-fruited variety had lately been discovered in the Black Forest, and that he had plants of it for sale. To this, Loudon gave the name of *V. Myrtillus baccis albis*. He repeats this in his *Trees and Shrubs* (1842), adding the name Booth as the authority. The discovery of the patch of 154 plants of the white fruited variety was made in 1835. Mr. W. J. Bean, in his book, *Trees and Shrubs Hardy in the British Isles*, maintains the name *V. Myrtillus fructu albo*, which is evidently the oldest. Old English names for the fruits are Whortles, Whortel Berries, Whortleberry, Biberry, and Blueberry (Scottish for Blueberry). Modern names are Whorts and Harts; hence we have the name, *Hurtwood*, of which there are two in Surrey, where the plant is still abundant. *Whinberry* and *Whinberry* are recent.

WOODLICE IN MUSHROOM BED: *D. G.* Place part of a half-boiled Potato (in the cooking of which no salt must have been used) into a small cardboard box, and cover the Potato with some very dry swamp moss. Lay the box on its side on the Mushroom bed, and open it at one end. The woodlice will enter the box to eat the Potato, and will remain because they will find the moss a comfortable resting-place. As many such traps as desired can be used, but they must be examined every morning, the lice shaken out into a pail of insecticide or paraffin water, and the Potato renewed as soon as it becomes unappetising. Paraffin emulsion can be poured over the woodwork and walls to destroy or discourage the lice, but should not be allowed to reach the beds.

'MY GARDEN' SERIES

MY GARDEN IN SPRING. By E. A. BOWLES, M.A. MY GARDEN IN SUMMER. By the Same Author. MY GARDEN IN AUTUMN AND WINTER. By the Same Author.

Price 5/6 each post free from— THE LIBRARIAN, 'THE GARDENERS' CHRONICLE,' LTD., 41, WELLINGTON ST., COVENT GARDEN, LONDON, W.C. 2.

Remarks: With the brighter weather of the past few days flowers from our outdoor display, Early Chry- santhemums are marketed in larger quantities and variety. The new variety R. Barnes is of great promise as a market sort. Best Carnations are firm at 2s. 6d. per dozen blooms, although plenty of inferior ones are sold at half that price, but these are of little use for sending orders in transit. There are a few blooms of Eucharis and Gardenia, but Stephanotis is very scarce, as also are Orchids. Hardy autumn foliage in- cludes Acer palmatum and oak.

Choppy and P.O.'s to be made payable to 'GARDENERS' CHRONICLE,' LTD., 41, WELLINGTON STREET, COVENT GARDEN, LONDON, W.C. 2. Telegrams: 'GARDENERS, RAND, LONDON.' Telephone: 1543 GERRARD.

NOTICE TO HEAD GARDENERS.

Revision forms for the "Gardeners' Chronicle" HORTICULTURAL DIRECTORY have been posted to Head Gardeners in every county in England, Wales, Scotland, and Ireland. In order to facilitate the early publication of the revised edition for 1918, gardeners are asked to return the forms with the necessary corrections **AS SOON AS POSSIBLE**. It is only by the co-operation of all gardeners that the 1918 edition of this invaluable work of reference can be made perfect.

Any Head Gardener who has failed to receive a form, should fill in the form attached below, and return it to

THE EDITOR, Horticultural Directory,

WANTED, experienced WORKING GARDENER, where a boy is kept; Vegetable and Flower Garden and Glass; small cottage; good references required.—Address, **C. D. TWOPENY**, Tynwald, Hythe.

WANTED, reliable Man as GARDENER; one who understands Orchids; must be ineligible for military service.—**J. HORRIDGE**, Bolbait House, Bury.

WANTED, for a private place, good Man as an all-round GARDENER; accustomed to Glass; not eligible for Army. Apply, **W. BELLAMY**, Park House, Wainborough, March, Cambs.

GARDENER (male or female) required at once; sole charge of 2-acre Garden, poultry, engine pump; wages 30s.—Apply by letter, stating experience and references, to **MRS. JESSEL**, Elmhurst, Ruislington, near Worthing.

WANTED, an experienced MAN, over military age, for Kitchen Garden; with knowledge of plants; good wages paid to a suitable man.—Apply, **F. W. T.**, Stanley's Library, 56, Stamford-hill.

WANTED, practical SECOND GARDENER (single); experienced (Inside and Out); good wages to suitable man. Full particulars to **SMALLEY**, Hall Gardens, Derbyshire.

WANTED, UNDER GARDENER for Outside; duty alternate Sundays; good cottage and garden given.—Apply, stating age, wages, and full particulars, to **ALFRED CHILD**, Cutsby House Gardens, Doveney, Northamptonshire.

WANTED, UNDER GARDENER, ineligible, where 4 or 5 are kept; one with good knowledge of stock and general farm work preferred.—Apply, stating age, wages required, with full particulars of experience, to **ARTHUR WEBB**, Alnacealgaon, Co. Chester.

WANTED, as UNDER GARDENER, young man (ineligible) or strong lad; comfortable lodgings.—State particulars to **W. JOHNSON**, Hillcrest, Camberley, Surrey.

WANTED, UNDER GARDENER (ineligible); also strong Youth to assist.—State ages and references, age, and particulars to **F. SIVELL**, c/o Mrs. R. P. Morgan, Brynhyfryd, North, S. Wales.

UNDER GARDENER for Kitchen Garden only, required at once; cottage provided if desired.—Write, stating age, if married, family, experience, references, &c., to **MANAGER**, Stoke Poges Club, Slough.

WANTED, at once, Two smart UNDER GARDENERS or discharged soldiers; wages 28s. weekly, both, &c.—Full particulars, **HEAD GARDENER**, Goldsboro' Hall, near Knarborough, Yorkshire.

WANTED, FOREMAN, by September 24, good all round, to take charge of Houses and superintendent outside during Head Gardener's absence in Army; single (ineligible), both and vegetables.—State wages to **A. THURSTON**, Heveningham Hall, Voxford, Suffolk.

WANTED, INSIDE FOREMAN; competent man; ex-service or ineligible; wages 30s. weekly, with both, &c. and attendance; duty and overtime paid extra.—Apply, with fullest particulars, to **GARDENER**, Park Place, Henley-on-Thames.

FOREMAN wanted immediately to take working charge in absence of Head Gardener (on service). Both (vegetables, root, light).—Apply, stating wages and experience, to **G. L. JARRATT**, Abberley Hall, Worcestershire.

WANTED, FOREMAN or good capable MAN, to take charge of Glass; 35s. per week; both, &c.; duty and overtime paid.—**BENNETT**, Snelston Hall Gardens, Ashbourne, Derbyshire.

FOREMAN UNDER GLASS REQUIRED for Asot, wages 50s.—Write particulars to P. B. B., c/o Streets, 30, Cornhill, E.C. 3.

WANTED, good JOURNEYMAN (inelligible), for Houses and outside; wages 25s. per week, with good Body and vegetables; Sunday duty and overtime paid.—Particulars to H. HATCH, The Gardens, Covenham Park, Micknall, Suffolk.

WANTED, JOURNEYMAN for Inside: good general experience, also IMPROVER for Inside. State wages, with Body, &c., and full particulars of experience, to H. KEMP, Prory Gardens, Reigate.

WANTED, HANDY MAN for Gardens, single, live on place; soldier or sailor discharged would suit. H. MORRISON, Willoughby House Gardens, near Rugby.

GARDENER-CHAUFFEUR required immediately, must also work electric light plant.—W. A. TENNANT, Orford House, Uxley, near Stansted, Essex.

WANTED, LADY GARDENER: trained to instruct pupils, School of Gardening, commencing this autumn, healthy country; near large town; salary, commensurate with position and qualifications; references exchanged.—Write, K. A., Box 15, 41, Wellington Street, Covent Garden, W.C. 2.

WANTED, FEMALE GARDENER: one accustomed to Hardy Fruits, Fungus and mauling Wall Trees, &c.; Body and vegetables, at London. References exchanged.—State wages required to W. R. WRIGHT, The Gardens, Ashby Saint Ledgers, near Rugby.

WANTED, W. Sussex, strong capable WOMAN, with experience. Vegetable growing and all sorts of pigs, willing to make herself generally useful, good wages, comfortable home. Full particulars to MRS. STAVERS, 2, Curzon Street, W.

WANTED, IMPROVER for the Houses, wages £1 per week, Body, &c., duty paid extra 1 week Saturdays. E. BRIDLOW, Leyswood Gardens, Grouseholme, Tunbridge Wells.

TRADE.

NURSERY MANAGER Wanted, competent MAN, with an edge of General Nursery stock, especially Fruit Trees and house and suburban planting. Full particulars, with references and wages required, E., Box 6, 41, Wellington Street, Covent Garden, W.C. 2.

MANAGER or FOREMAN: His experience in the trade, controlling labour and profit-making everything possible, for established estate, most good references. LAWRENCE, 85, Warwick Avenue, Finsbury.

PRIVATE GARDENERS awaiting SITUATION may obtain temporary employment under suited Particulars, &c., from JOHN RUSSELL, Devonshire Nurseries, Haverstock Hill, N.W. 3.

NEAR MANCHESTER—Wanted, active experienced WORKING FOREMAN, to take charge of a small Nursery, 25 per cent profit, in addition to wages. Address, stating age, experience, references, and wages required, M. B., Box 2, 41, Wellington Street, Covent Garden, W.C. 2.

WANTED, as FOREMAN, thoroughly experienced man in Herbaceous and Rock Plants; good wages; must have first class references.—Apply, R. C. NOTT, The Nursery, Woodbridge.

WANTED, FOREMAN GROWER for Greenhouses, Tomatoes, and Potting Plants; good wages, exchange, and vegetables found.—Apply, MAX AGER, Co-operative Garden Firm, North Hylkham, Lincoln.

WANTED, FOREMAN for Landscape work, including Robbery Construction. Write, giving full particulars of salary required, A. to JOHN WATERER, SOSS & CRIST, LIMITED, The Nurseries, Bagshot, Surrey.

SEED TRADE SHOP ASSISTANTS and WAREHOUSEMEN WANTED, permanent. Applicants, who must be eligible for military service, are requested to give full particulars of their experience and state age and wages required.—SEEDS, Box 5, 41, Wellington Street, Covent Garden, W.C. 2.

SEED TRADE—Wanted, smart, experienced ASSISTANT for Good Seed Department.—Particulars, stating experience, salary expected, &c., to W. D. MORGAN & SOSS, LTD., Dawson Street, Dublin.

WANTED, KNIFE-MAN, and as GENERAL FOREMAN, for 30 acres young Fruit Trees; wages 40s. and free cottage.—State age and full particulars of training to STORIE & STORIE, Fruit Tree Specialists, Gleanacre, Perthshire.

WANTED, October 1, young LADY ASSISTANT for Florist's shop, well up in floral work, good saleswoman, one with a knowledge of seeds preferred. State wages, position and references.—E. J. FAUCHELOK & SOSS, 19, Station Square, Harrogate.

WANTED, FLORIST—Young Lady as First Hand. Apply, stating experience, &c., S. FAY & SONS, Elm Grove, Southsea.

WANTED, a good BOOK-KEEPER, to take charge of general Nursery office; liberal wages to a competent and reliable man.—Wm. PAUL & SON, WALTHAM CROSS, LTD., Waltham Cross, Herts.

NURSERY STOKERS WANTED; good wages to suitable men, Apply, LOWE & SHAWYER, LTD, The Nurseries, Uxbridge.

SITUATIONS WANTED.

Twenty-six words for 1s. and 6d. for each succeeding eight words or less.

Gardeners desiring their Advertisements repeated must give full particulars, otherwise no notice will be taken of their communications. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. On no account should they enter into communication with unknown correspondents who require a fee beforehand.

Advertisers are cautioned against having Letters addressed to Individuals at Post-offices, as all Letters so addressed are opened by the Postal Authorities and returned to the Sender.

PRIVATE.

ADVERTISER seeks to engagement as **GARDENER** (under **GARDENER** of **BAILIFF** or **STEWART**), life experience in good establishments, experienced in the management of garden and stock, and in the cultivation of all crops. Apply, A. B., Box 1, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (under **ESTATE STEWARD**), 12 exp. years, all branches of garden and stock, and in the cultivation of all crops, well recommended, over 10 years' experience in horticulture and practical knowledge of the art of raising and working arrangements. Woodville Park, Kent, Home Counties.

GARDENER (HEAD), highly efficient & experienced, in the Home Counties. Apply, M. G., Box 1, 41, Wellington Street, Covent Garden, W.C. 2.

SITUATION required as **UNDER GARDENER** or **SINGLE HANDED**, thoroughly practical in Fruit, Fungus, and Vegetables, under glass or out of glass. State wages, &c., H. MORRIS, 41, Rumpall Court, Salisbury, Wilt.

GARDENER (HEAD); His experience in Fruit, Fungus, and Vegetables, House and out of glass, Potting, &c., &c., and Herbaceous Borders, Lawns, and Potting Grounds, married, age 30. GEO. HOWE, Frame Park Gardens, Ham, Oxon.

GARDENER (Head or otherwise), who understands the situation of work of national importance, and is a good vegetable grower, under glass or out of glass, married, single, &c., M. E., Box 1, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD WORKING)—Col. J. R. Wright could be proposed to recommend J. ASHDOWN as a top of garden requiring the services of a good practical man (Head and Out), who is several years' experience in Head, being through to London, no history and over 10 years' age. J. V., Box 1, 41, Wellington Street, Covent Garden, W.C. 2.

HEAD WORKING GARDENER offers His services as body or gentleman requiring a thoroughly practical man. His experience in the management and requirements of a large establishment, discharge certificate, personal references. CLEMENS, Somerhill Gardens, Tonbridge.

GARDENER (HEAD WORKING); good all round practical experience, Fruit, Fungus, Flowering, &c., above military age, married (no family), 14 years' Head Gardening, excellent references. E. B. S. SOSS, Wipers, Statham, Malvern, Sussex.

GARDENER (HEAD WORKING) proposes permanent situation; life experience, inside and out, age 46, married; present situation 14 years; good reference. G. CORNWELL, Brunica Cottage, Cross-in-Hand, Sussex.

GARDENER (HEAD WORKING), where 2 or 3 are kept, life experience, age 30, married (no family), cottage. E. J. JENNER, the Gardens, Bramshott Court, Liphook, Hants.

GARDENER (HEAD WORKING), with 2 or 3 under, excellent references, married one child, income experience, Cross C. J. KNOWLES, The Cottage, Wintonington, near Morio, Cambs.

GARDENER (HEAD WORKING); good all round experience with Grass, Fruit, Flowers, and all other gardening, Fencing, &c.; above military age, married, no family.—GARDENER, Farmer Grange, Stoke P. ges, South.

GARDENER (HEAD WORKING); good all round experience (inside and out), age 45, married (2 children), excellent references. BLAN, Devon, Otlington, Kent.

GARDENER (HEAD WORKING); life experience in all branches, knowledge of the running of electric light plant; married, age 48.—ORDER HILL, Ridgemoor Cottage, Slades Hill, Harlow, N.

GARDENER (HEAD WORKING) where 2 or 3 are kept, good all round, first class references. See military age.—GARDNER, Box 15, 41, Wellington Street, Covent Garden, London, W.C. 2.

GARDENER (HEAD WORKING); age 30; where several are kept, 14 years' experience in all branches, discharged from Army, good reference and well recommended; married when started, H. C., Box 15, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (HEAD WORKING) seeks permanent situation, end September, over military age, married (1 child), life experience, 12 years' present situation. Please state wages. Write, R. C., Box 15, 41, Wellington Street, Covent Garden, W.C. 2.

GARDENER (GOOD SINGLE HANDED); life experience gained in good establishments, highly recommended, excellent references. Army discharge, age 42, married (1 child). Please state wages. Write to H. B. R., 41, Wellington Road, Walthamstow, Essex.

GOOD SINGLE HANDED GARDENER; married, experienced, highly kitchen Garden, Glass, and Lawns, London district preferred. J. T., Box 19, 41, Wellington Street, Covent Garden, W.C. 2.

SITUATION required as **UNDER GARDENER**, highly recommended; strong LAD, age 17 years. Please state wages given, with Body, Apply, E. MORRIS, 47, Rumpall Road, Salisbury, Wilt.

JOURNEYMAN (FIRST), age 17, seeks situation (inside). 5 years' experience, 2 years at Horticultural School, thoroughly capable of duties. State wages and particulars to H. W. E. Augusta Villa, High Road, Longford, Essex.

LADY GARDENER seeks Post, experienced in practical work and in lecturing and teaching. Reading College certificate, instructorship preferred.—MISS STABBE, Woodford Lodge, Thurston, Norfolk.

LADY GARDENER requires Post under 12 good Head, inside of the 1 year's training; some experience may, some of preferred.—G. SMYTH, French Gardens, Stoneham, Wilt.

TWO LADY GARDENERS wish situation as Head and Under, where several kept; well trained, 10 and 6 years' experience, inside and out, good references. Please state ages and full particulars. P. B., Box H, 41, Wellington Street, Covent Garden, W.C. 2.

TRADE.

GARDENER (59); Inside experience; first-class Melons, Grapes, Chumbers, Tomatoes, Peaches, Baking Plants, Bulbs, Chrysanthemums, Mushrooms, &c., &c., 21, New Windsor Street, Exbridge.

TWO LADY GARDENERS, with little experience, to join Post together in Market Nurseries, Scotland preferable. J. B., Dalton Green, Dalton, Loderbie, N.B.

OPEN for engagement as **TRAVELLER, MANAGER, or HEAD SHOPMAN,** life experience, both wholesale and retail, over military age. Write, H. R., Box 2, 41, Wellington Street, Covent Garden, W.C. 2.

AS TRAVELLER; age 46; steady, active, reliable business man offers his services, 4 or 5 days weekly, or more if desired. F. R. H. S., Box 9, 41, Wellington Street, Covent Garden, W.C. 2.

FLORIST (situated London). Early requires re-employment; 14 years' experience Floral Desserts, Bouquets, Plants, Seeds; willing to take charge; refs. F. M., Box 15, 41, Wellington Street, Covent Garden, W.C. 2.

A ROSARIAN'S WAR SHIFTS.

IN normal times I adopt a very convenient rotation of crops in borders suitable for the purpose as follows:—1st year, Briars for budding; 2nd year, Roses; 3rd year, Sweet Peas, Pinks, or Carnations, followed by Daffodils, flowering in the 1th spring, when Briars are again planted among them, and the cycle is resumed. The Daffodils need not be lifted after the first year, but grown on to the second, as they will not harm the Briars, and are lifted rather early in the second spring of their growth, before the end of May, while the maiden Roses are not far advanced. The cycle may, of course, be started either with the Briars or the Sweet Peas, but the autumn after lifting the maiden Roses is, I find, a convenient time for re-making the beds.

This year I have planted no fresh Briars, as I intend to use the beds for the growing of food plants. The Briars are usually planted 1 foot 3 inches to 1 foot 6 inches apart, and this regulates the distance of the other crops; and the question arose, what would make the most convenient food plant substitute for the current year?

In some of the borders this has been solved by making use of the modern dwarf Peas, such as Carter's Daisy and British Wonder, which only grow one foot to one foot and a half high and can be conveniently planted between the rows of Daffodils; in others Broad Beans, raised in boxes and planted between alternate rows, have been used. When these are cleared they will be followed by Kale, which are comparatively ornamental as kitchen garden plants go.

In the case of beds at other stages of the cycle, room will be available between the plants in possession for growing Lettuces and other salad plants.

Most of the borders received a good

dressing of basic slag in autumn or early winter, but where this was omitted its place is supplied by spring dressings of superphosphate.

Where there are no bulbs in the ground, advantage will be taken of the coloured leaves of the Beetroot, which have been used with good effect before this, either for edgings or temporary beds.

Of all the salad plants in the garden there is none that gives so good a return with so little trouble as Watercress. This can be grown in the open garden, and is, I think, more wholesome than when grown in water. At the end of April or early May, shallow trenches about a foot wide are taken out, and manure worked in the bottom, somewhat in the way that a Celery trench is made. Some fine soil is broken on the top of the manure and cuttings inserted in a double row. No plant grows more easily from cuttings than Watercress, the cuttings appearing to begin growing before they could be expected to have rooted. This is owing to the fine roots readily formed anywhere up the stem. These shallow trenches furnish a full supply till November. They can very conveniently be made between the rows of Daffodils when these have been kept the distance apart recommended.

In November some boxes are prepared with sides about 4 inches deep. Some old manure is put in the bottom about 2 inches deep and rammed down. On this is placed a layer of leaf mould, and finally the box is filled up with soil, in which the Watercress cuttings taken from the plants in the shallow trenches are inserted, and the boxes are placed in a cool greenhouse. They soon grow, and continue to produce supplies until they in turn furnish cuttings for the trenches. Three or four boxes give a good supply through the winter. By this means a plentiful supply of Watercress is secured through the whole year. I think we have never appreciated it so much as this year, when, except for the hardiest Kales, there was no green stuff left in the garden when spring arrived. Perhaps I should add that we have found it better to take fresh cuttings than to put out the old plants, for by the end of the season the soil in which they have been growing has usually become rather sour, and the stems hard and woody.

The Rose house itself becomes a useful place for a few vegetables grown as makeshifts. In between the Roses in pots young Cauliflowers and Lettuces can be grown in 5-inch pots without detriment to the Roses; in fact, to their advantage, for it lessens the risk of overcrowding, and this is a danger to which many of us are liable. As our Roses increase we often fail to discard the older ones to the extent that is desirable, and there are few more serious troubles to Roses under glass than those which arise from overcrowding. *White Rose.*

FRUIT REGISTER.

STRAWBERRY LORD SUFFIELD

MR. TAYLOR, gardener at Stanmore Hall, Middlesex, states that he has always held this very distinct, richly-coloured, and finely flavoured Strawberry in high esteem, especially for preserving, as the berries retain their form and flavour better than any other kind. The plants at Stanmore Hall have cropped well this year, and the supply has been unusually prolonged, the plants being still in bearing. The berries in jams made last year are as perfect and brightly coloured as when gathered. For trade purposes the variety is not likely to be a favourite, but for private gathering it is well worth attention. *B.*

ORCHID NOTES AND GLEANINGS.

NEW HYBRIDS.

LAELIO-CATTLEYA JACINTH.—A flower of this beautiful hybrid, raised in the collection of Lieut. Col. Sir Geo. L. Holford, Westonsairt, Leighton, between C. Trianae and L. C. Pizarro (C. Dowiana x L. Jongheum), is sent by Mr. H. G. Alexander, who was also the raiser of L. C. Pizarro, one of the parents of L. C. Jacinth. In size and shape the flower resembles C. Mossiae aurantiaca, but the bright orange colour of the basal two-thirds of the lip is more pronounced and extended into the side lobes. The sepals and petals are rose pink, the lip dark orange colour, the lines from the base being on a bronzy red ground and the margin bluish white. L. Jongheum is esteemed for hybridising for the rich yellow of the lip, but it has a tendency to restrict the expansion of that organ. In this case, in the second generation the good feature has been preserved and improved in a labeum of good size, and with an ample crimped edged front.

HYBRID ORCHIDS.

Raised in the gardens of Lieut. Col. Sir Geo. L. Holford, R.C.V.O., by Mr. H. G. Alexander.

HYBRID LILIUM.

MANY years ago great interest was shown in a remarkable hybrid Lily which had been raised in America, between *Lilium speciosum* Melpomene and *Lilium auratum*. It was known as *Lilium Parkmanni*, and a coloured plate of this remarkable Lily appeared many years ago in *The Gardener*. I always understood that the stock was growing at the Knip Hill Nurseries, but that it eventually died out. A somewhat similar hybrid is illustrated in

SUMMER PRUNING.

A WRITER in a contemporary states that "standard trees should not be pruned in summer—and very lightly at any time, because it encourages an undesirable growth of lateral shoots." My opinion is that standard Apple trees receive as much benefit from summer pruning as any form of tree.

I have standard Apples of Bramley's Seedling with cord-on-like branches radiating from the centre 8 feet or more on all sides, and they

by the admission of air and sunlight to the base of the shoots pruned, thus aiding the ripening of the wood in those parts of the tree. In the case of established trees, much discrimination as to which shoots to cut is not required, because the form of that particular tree has already been determined, but in the case of young trees some care should be exercised in retaining shoots that are required for extension, all surplus shoots being shortened to within 4 inches of their bases, leaving the leaders intact. Sometimes the leading shoot on a side branch is so placed that it grows inward. This irregularity of growth is usually the fault of winter pruning, the bud at the point of the pruned shoot being on the inside of the tree instead of pointing outwards. In summer pruning this error should be corrected by the removal of the shoot down to the next branch which aims outward; this growth is thus made a substitute for the previous leader, and the correct balance of the tree is maintained.

The middle of July is a good time to summer prune fruit trees, as they seldom make secondary growths after that time.

No fruit tree responds more to summer pruning than the Red Currant. When the shoots are trained cord-on-like from the centre of each bush, such branches yield an immense weight of fruit annually. E. M.

THE MARKET FRUIT GARDEN.

APPLE SUCKERS AND FRUIT SETTING.

THIS season, for the third time, I carried out an experiment with the object of testing the extent to which infestation by the Apple sucker affects the setting of Apples. In the first season trusses of blossom that were infested and an equal number free from infestation were labelled on four varieties, and the result was that more Apples set on the infested than on the non-infested trusses. But it is one thing for fruit to set, and another for it to continue to hold its place up to maturity, and the latter point was not tested in 1915. In 1916, however, the number of fruits set was taken first on June 5, and again on July 4. At the former date the experience of 1915 was repeated, more Apples having set on the infested trusses than on those free from suckers. But on July 4, when the fruit was nearly mature, the converse was the result, 20 Apples being found on what had been 24 trusses that had been free from the pest, against 14 on the same number of infested trusses. This season the trial was made with ten infested and ten non-infested trusses of each of four varieties, Mr. Gladstone, Beauty of Bath, Worcester Pearmain, and Lane's Prince Albert. The results were as follows on July 12, when the fruit found might be regarded as set for good: Mr. Gladstone, five singles on infested, and two singles and one double on free trusses. Beauty of Bath, three singles on infested and two on free trusses. Worcester Pearmain, six singles on infested and three singles on non-infested trusses. Lane's Prince Albert, only one on each. The summary is as follows: 40 infested trusses set 15 singles, and 40 free trusses set 7 singles and one double. By the way, this season is remarkable for Apples singling themselves—a very useful action.

Now, I have been censured for having stated the opinion that the damage done by the Apple sucker is greatly exaggerated. But what other conclusion can I form from my observations? Those observations cover, not only the results of labelling infested and free trusses, but also the growing of great crops on varieties worse infested than any others. Last year, for example, I found 39 out of 40 trusses of Royal Jubilee infested with suckers, and by "infest-1" I mean that at least two of the pests were seen. Yet the crop of Royal Jubilee Apples was the greatest grown by me in that season.

FIG. 31.—HYBRID LILIUM (*L. SPECIOSUM* MAGNIFICUM × *L. AURATUM* PLATYPHYLLUM): FLOWER SPOTTED WITH CRIMSON.

fig. 31. It was raised by Mr. P. S. Hayward, gardener at Holland House, Clacton-on-Sea. The cross was effected three years ago between *Lilium speciosum* magnificentum and *Lilium auratum* platyphyllum, the latter being the seed parent. The plant is now over 3 feet in height, strong and vigorous. The blooms are 11 inches in diameter, with petals nearly 4 inches across; the spotting is bright crimson. It is a very distinguished-looking plant, showing so much vigour already that it seems likely that eventually it will grow to a height of 5.6 feet and bear 12-15 blooms. It is remarkable that in such a wide genus as *Lilium* so few effective hybrids should have been produced. R. W. Wallace.

annually bear good crops, the result of yearly summer pruning. To me it always seems to be good practise to summer prune fruit trees, especially erect-growing varieties of Apples, such as Lord Derby and Benoni, erect-growing Pears and Plums, and certainly Red and White Currants. The object of summer pruning is to aid in the maturation of the branches so that they will form fruit spurs naturally, aided by the checking of the growth of the other shoots.

I do not, however, say that the cutting away of a portion of the summer growth on any branch will result in a fruit spur forming forthwith, as many persons assert. The assistance summer pruning gives to the fruitfulness of the tree is

This year, again, Lane's Prince Albert was so badly infested that it took me over an hour to find ten trusses free from the pest on the tree labelled. Yet there is a profuse crop on this variety. The choice of the tree labelled was an unfortunate one, as it was in a somewhat shaded position, and it bears an exceptionally thin crop, although other trees were as badly infested. But the number of blossom trusses on the variety generally was so enormous that one Apple to ten trusses would mean a fair crop. Let it not be supposed, however, that I maintain that the sucker does no harm at all. What I do maintain is that the injury done by it is much exaggerated. In at least two seasons, when Apples in my orchards, as in those of the country generally, set badly, and the failure was commonly attributed to an attack of the sucker, careful examination of a great number of the withering blossoms proved that this was not the case. It is my intention to carry my observations of infested and non-infested trusses further than they have been carried hitherto, by taking note of the sizes of the Apples set when nearly mature. Such observation as has been made on this point conveyed the impression that there was no noticeable difference, but no precise notes upon it were taken. *Southon Grower*.

ON INCREASED FOOD PRODUCTION.

PROLIFIC POTATOS.

It would seem likely that many records will be broken this year in regard to Potato crops; the following result is, I think, worth recording for an early variety. Thirty-six plants of *May Queen* variety were lifted at The Gables, Beckenham, the residence of Mr. A. J. Lees (gardener, Mr. A. Scutcher), and the heaviest crop from an individual root weighed 10 lbs., whilst the lightest yield was 2 lbs. The total weight of the crop was 203 lbs. Has this weight been surpassed with an early variety? *F. H. Price, Broadblyt Garden, Beckenham*.

SEED GERMINATION.

I ENDORSE *J. E.*'s remarks (p. 55) about the irregular germination of Brassica seeds. We had three crops from one sowing. The first sowing of Thyme quite failed, yet a second sowing gave us enough plants to stock the parish, as *J. E.* remarks. Beans here are all good, and Peas also, with one exception. Our worst failure was with early Potatoes, the "seed" of which was purchased from a well-known firm. We sprouted the tubers in boxes, but they have completely failed after planting. Frosted seed would no doubt account for this. Early Potatoes from our own stock have done very well, and the later varieties look very promising.

In reply to *J. E.*'s query as to how to preserve Beans, the way we proceed is to gather the pods when just at their best for table use. Slice them as for cooking, and then place in wide-necked bottles, a layer of Beans and a layer of salt, until the bottle is filled. When the Beans are covered in the brine, make the bottles air-tight and store them in a cool place. When the Beans are required for use, they should be soaked in water for two or three hours. By this method we have kept them good for months. *Thos. B. Archer, Preseat*.

POTATO DISEASE.

The Food Production Department issues the following description of late blight in order to enable allotment holders and others to recognise the disease:—

The first sign is the appearance on the leaves of dark brown or blackish spots of irregular size and shape, from the under surface of which a delicate white mould grows out, especially round the margin of the diseased areas. The dark coloured patches rapidly spread, the leaflets

become curled, and if weather conditions favour the blight the whole of the foliage and the stems too may soon become blackened. In wet, muggy weather the greyish mould which is the most characteristic sign of the disease) may grow out from the upper as well as the under surface of the leaves. If dry weather follows an attack of blight, the affected leaves shrivel rapidly and fall off, leaving the haulm bare.

WAR AND FRUIT GROWING.

In war we discover that many things which in peace we regarded as necessities are but luxuries, and we learn cheerfully to do without them. The converse is also true, for in war some luxuries become necessities. This is true of hardy fruits. Man does not live by calories alone. The food which he eats must maintain health as well as strength. Among the most wholesome of foods are fruits. The Medical Services, recognising this, insist on a liberal ration in the Dietary of Navy and Army. But imports of fruit are scarce and restricted, and the jam must therefore be made from home-grown fruit. There is, however, not enough home-grown fruit to satisfy fully the requirements of H.M. Forces and of the civilian population. The former require 45 or more per cent. of the Plum crop, 75 per cent. of the Raspberry crop, and little, if any, less percentage of Strawberries. It is not likely that these demands will be reduced in the coming year. They are more likely to increase. Therefore it is of the greatest importance that fruit-growing should not be discouraged. Fruit-growing requires skilled labour. The men in charge of commercial orchards are indispensable to the maintenance of these orchards. Unless proper attention to pruning, spraying and the like are provided the yield of fruit will fall off immediately both in quantity and quality. It is therefore to be hoped that Tribunals called upon to decide between the exemption or calling up of skilled commercial fruit-growers may understand that our hardy fruits are no longer to be regarded as a luxury but as what they are—of national importance, and less essential only than corn and meat. The need for men is very great, and the Army must have men; but since the Army must also have fruit it is essential that the skilled fruit-grower be left to direct the cultivation of the crops.

FRUIT CONSERVING.

The Food Production Department intends to establish pulping or drying plants in each of the chief fruit-producing districts. At Cheltenham the works are already in existence, and surplus fruit is being pulped. The supplies handled in this way are additional to those covered by the scheme of controlled jam-making establishments under the War Office.

To deal with the pulping of Plums, centres will be opened at Cambridge, Bewdley, Pershore, Cheltenham, the Harper Adams Agricultural College in Shropshire, at Maidstone, Sittingbourne, Marden, and Chester. The drying scheme in Kent will be attended to from Wye College, whose experts have a close personal knowledge of the county. Farmers' cooperative societies and market growers' associations are also being brought into intimate touch with the scheme.

For the Apple crop, pulping stations are being established or are contemplated, at Plymouth, Totton, Crediton, Newton Abbot, Tiverton, Bridgewater, and Wedmore, near Cheddar.

The scheme is developing rapidly and satisfactorily. An encouraging circumstance in connection with these plans is the cordial cooperation of many business firms, not normally connected with food production or preservation. A notable instance of this admirable public spirit has been afforded by the action of Messrs. Edward Lloyd, Ltd., paper manufacturers. Their mills at Sittingbourne are situated in the midst of a large fruit-growing district, and it was deemed desirable

by the Department to open a pulping works there. Mr. R. H. Bell, the representative of Messrs. Lloyd, was approached, and at once offered to place at the disposal of the authorities ten free a commodious shed that could be turned quickly and conveniently into a pulping works. Moreover, he agreed to loan to the Department the firm's engineering and carpentering staff and to facilitate the transfer of some of the female employees from the paper mills to the pulping concern.

At Maidstone, Messrs. Sharpe and the Farmers' Union have been brought together by the Food Production Department in a mutually advantageous scheme.

AUTUMN SOWN CAULIFLOWERS.

Is the old method of sowing Cauliflower seed towards the end of September in cold frames and on a south border to be given up? Many growers say that with the introduction of quick-maturing varieties, that may be sown in early spring in gentle warmth, and gradually hardened off, there is less trouble than in sowing in autumn. But if Cauliflowers are worth growing, they are worth growing well, and for cutting in early spring one cannot beat autumn-sown plants. Last September I sowed Danish Giant and Magnum Bonum; the seedlings were pricked out 6 inches apart each way in cold frames, and freely ventilated during winter when possible. In April the plants were put out on a south border, and protected from cold winds. Some of the best plants were taken up with a good ball of soil and planted in deeper frames, and we were able to cut nice firm heads long before the spring-sown plants were fully established. *C. Davis, Holy Wells Park Gardens, Ipswich*.

DISEASE-RESISTANT VARIETIES OF CABBAGE.

In an address given before the American Seed Trade Association, Detroit, Dr. L. R. Jones, Plant Pathologist in the University of Wisconsin, describes the results of his experiments directed to raising varieties of Cabbage resistant to the disease known as Yellows. The disease, due to a fungus of the genus *Fusarium*, is serious in that it not only destroys the growing plant, but persists in the soil "Cabbage sick," so that it is said to be useless to attempt to grow Cabbages in that soil.

By selection from Ferry Hollander and Danish Ballhead, Dr. Jones has raised a resistant strain, which, it is claimed, grows well even in the sickest soil. He has named the strain Wisconsin Hollander.

WINTER SPINACH.

Of all winter vegetables Frickly seeded Spinach is the best. The seeds should be sown at intervals of fifteen or eighteen days during August and September. The crop sown in August will give a supply before the New Year, and the later sown batch will furnish leaves during spring. Choose moderately rich ground and an open, dry situation. Where space is limited the rows may be placed 15 inches apart, but 13 inches is better. Sow the seeds very thinly, about 14 inch below the surface. Should the soil be very dry, water the drills before sowing. As soon as the plants begin to meet in the rows, they should be thinned to 8 inches or more apart. In severe weather a little bracken or litter thrown over the plants will afford all the protection necessary. *James A. Peice*.

FINGER-AND-TOE.

I WORKED for some years in a Kincardineshire garden, where my predecessor was unable to grow members of the Brassica tribe with any degree of satisfaction, most of the crops being failures. The gardener was a great advocate of trenching, and to that alone he attributed immunity from Finger-and-Toe, for there was none in the garden while I was there.

Some years ago, in a suburb of London, I commenced gardening on a site that had been a bare playground for children for many years previously, so that the ground could not have been considered weedy. Previously to the building of the houses, the land had been part of an orchard, and I grubbed up some of the Plum tree roots. Flowers and vegetables were grown, and some of the earliest sowings consisted of Cauliflowers and Wallflowers, both of which were ruined by the *Plasmodiophora*. Unless the disease was imported with manure, it would be difficult to account for its presence, for it could scarcely be carried on the seeds. On an old allotment ground in my neighbourhood this disease has attacked several varieties of Cauliflower and Cabbages on one of the holdings. The first lot of Cauliflowers was reared upon the ground, but a second lot, obtained from a large private garden, is following the course of the first. The Cabbages were obtained from the private garden, and succumbed just as they commenced heading. Brussels Sprouts from the last named source are still thriving vigorously, also Curled Kale. Two sowings each of Turnips and Radishes attained full size, and were free from the disease, although quite close to the ruined Cabbages. This allotment changed hands last year, and, being badly infested then, the new holder has not had time to clean the ground. J. F.

SPRING CABBAGE.

The spring of 1917 must surely rank as one of the most disastrous seasons on record for this useful vegetable in many localities in this country. The continuous cold east and north-east winds were no doubt responsible. I have some large plantations practically ruined. Autumn sown plants were almost untenable and one had to depend to a great extent on early spring-sown plants. I was interested and pleased to see Mr. James A. Paine's notes on the above in the *Gardeners' Chronicle* for July 21 (p. 24). I concur entirely with his remarks almost in every detail, and having seen his Cabbage plantation on several occasions, during winter and spring, not only this year, but in previous years, I know he is writing with a full knowledge of his subject. I do not hesitate to say that it was quite the best bed I have had the pleasure of seeing this year, and it was a complete testimony to the practice he advocates.

PEA "DISTINCTION"

NEARLY every year I try some new Pea against older and well-known varieties. The variety Distinction was sent to me last spring, and I sowed a row 100 yards long. I am glad to say it has proved to be, with us, a valuable variety. The haulm grows to a height of about 5 feet, literally laden with shaggy pods, and may be described as an early "Gladstone" in the shape of its pod; above all, its table quality is first-rate. All desirous of growing a Pea of this height will do well to make a note of this new sort. E. Roberts, Aldham.

FRUIT TREES ON GRASS.

ON p. 62 Mr. Faener draws attention to a subject that has been debated until it is almost threadbare, and yet his remarks are interesting to those who have had experience of growing Apple trees on grass. It is well known that Apple trees will flourish on grass when the land is properly prepared by trenching and manuring, and left clear for several years after planting; but merely to make a hole, stick the trees in, and allow the grass to grow at once close up to the trees is to court disaster. The subject of canker, too, is still a problem. No doubt the main cause is defective root action. Certain varieties, too, are more prone to the disease in cold soils than others. For example, Stirling Castle fails to grow on heavy soils except with special treatment, to which, I think, all varieties are amenable. Even Cox's Orange Pippin, which is very liable to canker, can be made to resist the evil. JF.

The Week's Work.

THE KITCHEN GARDEN

By J. DENN, Foreman, Royal Gardens, Windsor

WINTER CUCUMBERS. As soon as possible plant out young Cucumber plants which were raised from seeds sown a month ago, so that the trellis may be covered with short-jointed growth before autumn. The structure in which they are to be grown should be thoroughly cleaned and the walls washed with hot lime. Burn a little sulphur in the house previous to making the bed, in order to make quite certain of the destruction of red spider and thrip, which may have escaped the scrubbing-brush. When the fermenting material has been prepared, it should be placed in position and trodden tightly together. The soil may then be placed on the bed in small mounds and allowed to become heated through before planting takes place. Great care must be exercised about the temperature of the soil, for although cold soil would be injurious, overheated soil would destroy the young roots. Only small amounts of light compost should be introduced to the bed at first in order to leave room for frequent light top-dressings, which is the best means of keeping the plants in a healthy condition throughout the autumn and winter. The compost may consist of turfy loam and leaf soil, and should never be applied in sufficient quantities to become sour before permeated with roots. Seeds of Dickson's All the Year Round and Every Day should be sown now in small, clean pots for planting a month later.

CAULIFLOWER FOR PLANTING IN APRIL. Some growers do not favour the autumn sowing of Cauliflowers, but I have found the best results to be obtained in this way: the plants are stronger and the heads much finer than those raised in heat in spring. At Frognor, we sow the seeds in a cold pit as near the middle of September as possible, but in northern localities sowing should take place a few days earlier. The seeds thinly and protect them from birds with ordinary garden netting stretched over the pit, the lights being removed. When the plants are large enough they should be potted into 60 sized pots and the soil made firm. When potted, place the plants on a bed of ashes within 15 inches of the rafters, and keep the lights off until the weather becomes frosty. Old loam from a Molton bed will suit the purpose well. Great Dane, Magnum Bonum, and Early London are good varieties, and have all done well here this season.

TOMATOS. Plants intended for putting in December should be ready for their final potting. Those in 6-inch pots with a truss of bloom on each will require very careful handling, for if the roots are damaged the first trusses may fail to set. Pot moderately firm in a compost consisting of three parts turfy loam and one part decayed horse droppings, with sufficient sifted lime rubble to keep the soil porous. The plants should be grown in a well-ventilated glass structure, fully exposed to the sunlight, and not far from the roof glass. Endeavour to obtain stocky growth and a good set of fruits. Secure the stem to a stout stick, and remove all secondary growth. As time advances and a full set of fruits is secured, a little more top growth may be allowed, as this will favour healthy root action. At this stage manure water may be applied twice weekly. Plants which are swelling their fruits should be stimulated on frequent occasions with artificial manure previous to watering. Let the house or pit be freely ventilated during favourable weather.

POTATOS. Lift the crop of second early Potatoes forthwith, and place the tubers in a well-ventilated shed. Later varieties should also be lifted as soon as the haulm begins to die down. The recent heavy rains have been very unfavourable to this crop, and as soon as the soil is sufficiently dry the work of lifting should be commenced. If shed room is available, the tubers should be placed under cover, to be examined during wet days before they are placed

in store for the winter. It is good practice to dust the tubers freely with lime as they are stored.

FRENCH BEANS.—Continue to plant French Beans in heated pits in order to maintain the supply of pods as far into the autumn as possible. Seeds may also be sown in 7-inch pots with the same object in view. The pots may be placed in any position until the plants are through the surface, and at that stage they should be raised to within 18 inches of the roof-glass and watered liberally. Ventilate freely to obtain robust plants that will be capable of carrying a crop after the ordinary supply is finished.

LETTUCE.—A sowing of Lettuce may be made on a warm border, where protection from early frost and heavy rains may be given. The seedlings may be transplanted into spare cold pits when other crops, such as French Beans, are over. If the bed is raised to within 18 inches of the roof-glass, good Lettices will be produced throughout the winter. The soil should be light and rich, and stirred frequently on the surface. All the Year Round and Maximum are good varieties for pits in winter; the last-named is of recent introduction, and is a very fine Lettuce for winter and early spring supplies.

TURNIPE.—Winter Turnips are ready for thinning to 9 inches apart in the rows. Stir the soil frequently with the Dutch hoe. This crop will benefit by frequent light dustings of soot and sifted wood ashes.

BEEF. All roots which have attained their full size should be lifted at once, and, after the foliage has been carefully removed, placed behind a north wall for use during the autumn. If this work is not accomplished before the roots are too large a certain number will be unfit for use.

MINT. Mint intended for forcing in winter should be cut close to the ground as soon as the foliage shows signs of ripening and the plants allowed to remain dormant until the end of October, when the roots may be lifted, placed close together on a gentle hotbed, and lightly covered with sifted soil.

FRUITS UNDER GLASS.

By JAS. H. DUNN, Head Gardener at Gannorsbury House, Avon, W.

PEACHES AND NECTARINES.—All permanent trees of Peach and Nectarine that have been even slightly forced will by this time have been cleared of their crops. September is about the best time of the year to give attention to the borders. Some may need renewal of soil, owing to the gradual process of exhaustion, following years of successful cropping, or the plants may be growing too vigorously, and not fruiting so freely as may be desired. In each case remedial treatment may be applied by paying attention to the state of the border, and of the roots. Trees that lack vigour should have some of the soil taken away and replaced by fresh, turfy loam from the stack kept in reserve. To this add some old mortar rubble that has been passed through a half-inch sieve. If the loam be not so good as one could desire, add a small quantity of manure from an old Mushroom bed, or some well-rotted manure that is on the dry side. Start by riddling out the old soil around the extremities of the border and down to its base, so that the drainage can be inspected. Work onwards towards the stem, gradually reducing the quantity of soil removed, and when it is found that the roots are abundant it will be well to cease digging. As a rule, one-third of a border may in this way be removed and renewed with distinct advantage to the trees. Having carefully pruned the roots that are healthy and sound, replace them with equal care in the new soil and make the border firm during the process; should any roots be deficient of lateral or fibrous roots, it will be well to notch them slightly to induce fresh fibrous roots to form. Put back just about as much fresh soil as was taken out. When the work is completed, give one good watering and syringe the trees twice or thrice daily; some of the leaves may drop, but that is immaterial so long as the wood does not shrivel. It is remarkable how soon root action takes place. This com-

mences long before the flowers begin to unfold or there is any wood growth. Take care not to stand pot plants of any kind whatever on these new borders, but expose them to both light and air. In the case of over vigorous trees the treatment is about the same as for the exhausted trees, with the exception that all, or practically all, the soil may be replaced, only a little fresh soil being added next to the roots. This is more a case of root pruning to induce fertility, therefore search out any too sappy roots and shorten them as may be found to be desirable. Notch them also in this case to encourage fibrous roots to form, and both syringe and water as in the former instance. Those strong-growing trees may still have some sappy shoots, which should be shortened. Have the soil necessary for these operations mixed and prepared beforehand, and keep it in a rather dry condition.

THE FLOWER GARDEN

By W. J. GRISB, Gardener to Mrs. DELPSTER, Keele Hall, Staffordshire.

PROPAGATING BEDDING PELARGONIUMS.—Cuttings of zonal leaved Pelargoniums may be propagated successfully in several ways, and this season the quickest method should be adopted. Use boxes to hold fifty or sixty cuttings each, or, still better, if a shallow heated frame is available, insert the cuttings in the bed of the frame 4 inches apart, and let the bed be composed of sandy soil. Remove the lights entirely, exposing the cuttings to the air and sunshine. Let the cuttings of the zonal section dry for a few hours after they are trimmed, as the wood may not be well ripened, owing to rains. Make the cuttings quite firm in the soil and water them through a rosed can. If boxes are used, they should be stood on a bed of ashes in a sunny place, or in a shanty frame, where they can be easily protected from rains. When the cuttings have been sown, remove all dead flowers and foliage, stir the soil between the plants, with the flat hoe, pinch the edging plants into shape, trim the verges, and freshen the gravel paths by raking them with an iron rake.

PLANTS IN VASES. Plants in vases should be given attention at least once a week, to remove dead flowers, foliage and seed pods, and trim the growths. Stimulant mists be given frequently or light top dressings of rich soil.

EARLY FLOWERING CHRYSANTHEMUMS. Stimulants in some form should be given early Chrysanthemums twice weekly. In a dry manner, sod-water, or concentrated fertilizer, forked lightly into the soil, followed by a soaking of clear water, will be beneficial. Keep the shoots neatly tied, and disbud any varieties that need it, but many are better when they flower in sprays.

ORDERING BULBS. Orders for spring flowering bulbs should be placed with the merchant without further delay.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to St. JOHN'S COLLEGE, Bart., Gaitton Park, Reigate.

LÆLIA ANCERS and its varieties are fast developing their pseudo-bulbs, and the flower spikes are making good progress. Liberal supplies of water at the roots, and slight syringing overhead, should be given during hot weather. The plants should not be excessively shaded, but should be protected during the hottest part of the day to prevent scorching. Close the house early in the afternoon, and open again on warm nights, as the night air is very beneficial.

CALANTHE. The deciduous *Calanthes* are in full growth, and forming new pseudo-bulbs. If healthy and well rooted, they will require more water at the roots now than at any other period of their growth. Expose them to as much light as possible, short of their being scorched by the sun. They should be placed near the roof glass, and whenever possible should be afforded plenty of fresh air.

ODONTOGLOSSUM. Plants of *Odontoglossum crispum*, *O. Pescatorei*, and their hybrids, which flowered early in the year, are making new shoots and roots are on the point of developing at the base. Give fresh rooting material at

once to those that require it. Plants that have grown to the sides of their pots and others in compost that has become exhausted should be repotted, removing them from their pots and shaking all the old materials from their roots. Decayed roots should be cut away, also the old pseudo-bulbs, leaving two or three healthy pseudo-bulbs behind the young growth. Use a pot large enough to accommodate the plant for two seasons, and fill it to one-quarter its depth with clean crocks for drainage. Over the crocks place a thin layer of Fern rhizomes cut in short portions. Work the compost with moderate firmness, between and around the roots, keeping the base of the young growth about on a level with the rim of the pot. The front portion of the rhizome must not be buried, but allowed to rest on the surface of the soil, so that when roots develop they may enter the materials direct. Plants that are in bad health should be taken from their pots, cleaned thoroughly, and placed in the smallest receptacles that will hold them. Back bulbs that have been removed may be placed in small pots filled with crocks, and when they break into growth, potted. Plants which are growing satisfactorily and have sufficient room in their pots for another season's growth, may, if the compost is good, remain undisturbed, but some of the old material should be carefully poked from the surface and replaced with fresh compost. A good rooting medium consists of short pieces of Osmond fibre and Al. blue in equal proportions, with a liberal addition of chopped Sphagnum moss and crushed crocks. Exercise great care in watering, and keep the surface layer always moist, syringing each morning. Many other *Odontoglossums*, including *O. simulans*, *O. Hoveyana*, *O. polyanthum*, *O. Tuto-nurumense*, and their hybrids, should also be given attention at the roots as it becomes necessary, and the work must be completed before the end of September.

THE HARDY FRUIT GARDEN

By W. A. COOK, Gardener to the Hon. Arthur J. DAVEN, Abbots Wood, Godingham, Surrey.

MORELLO CHERRIES. These have cropped well this season. The nets should be taken down and the trees well cleaned. If any black aphid is present, give a washing, with the potassium solution, treating every portion of the foliage. Any fruit still on the tree at this time should be suitably protected to keep away wasps and flies, and if the fruits can be kept dry they will keep good and fit for use for a couple of months. These fruits make very collect preserves, and are far superior to sweet cherries to fairs. The Morello Cherry needs different pruning from the sweet cherry, and should be treated more like the Peach, that is, cutting out the old wood and retaining the young shoots, which will produce fruit next season. They will grow and fruit from spurs, as will the Peach, but after a year or two the trees begin to get very ugly, and as I have recommended, it is the best practice to prune as I have recommended. If the trees are pruned now the shoots will not need to be closer than 6 inches.

PEACHES AND NECTARINES. *Grosse Magnonne* Peach is generally at its best after the first week of September, and is followed by *Diamond*, *Belle-Garde*, *Princess of Wales*, and *Sea Eagle*. The roots of the trees should be fed to enable the fruits to finish perfectly. Draw some of the leaves aside to allow the sun's rays to reach the fruits. If red spider has been kept under, the pest will not be very troublesome after this date. All trees from which the fruits have been gathered should receive attention in watering and syringing, in order to keep them in good health. Trees that have been condemned should be rooted up and the ground set ready for the reception of healthy specimens. It is good practice, if time permits, to cut away all old fruiting wood as soon as the fruit is gathered. In this way extra light and sunshine will enter the trees, and ripen the shoots. Early varieties of Peaches and Nectarines that have nearly completed their growth may be transplanted if desired. Before lifting the tree, see that all the branches are unfastened from the wall or trellis. Make the soil firm about the roots, shade the tree in times of bright sunshine,

and syringe the leaves and shoots several times daily for about a fortnight.

FRUIT GATHERING. Proceed to gather all fruits that are ripe and store them in the fruit room. When all are gathered, give the trees a good cleansing with petroleum emulsion or nicotine soap. The operation should be done thoroughly, and several applications may be necessary.

STORING OF NETS.—Nets used for protecting bush fruits from birds should be dried and stored for another season. The heavy rains have shortened the season of these nets, and except on walls it is difficult to keep *Gossieberis* longer, as they have commenced to drop. Those on walls, which can be kept drier, should be protected with wasp-proof netting. If any wasps' nests are discovered pour in a quantity of cyanide of potassium, dissolved in boiling water. This is a dangerous poison, and should be kept tightly corked, under lock and key, and only entrusted to competent and responsible persons for use.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Northcott, Eastwell Park, Kent.

EVERGREEN OR PERPETUAL-FLOWERING BEGONIAS.—These *Begonias* include *President Carnot*, *Indisolds*, *Cocoonia*, *Andra* and *Andra alba*, *Prætor*, *ascotensis*, *curvata* and *knobs*, *lyana*. They are all attractive plants, and if given suitable treatment will flower almost perpetually. *B. cocoonia* is one of the most showy, its coral red flowers, produced in large panicles, being most attractive, and when the whole roof of a house can be given up to the plant, it makes a picture not soon to be forgotten. The plants in this section should not be restricted to pots, but given liberal treatment in tubs, boxes, or planted out in small prepared borders, as best suits the individual case. There is no doubt that a small border is the better plan in many ways, but owing to the arrangements of the water pipes, stages, and paths, this is not always practicable, and tubs or boxes must be used. We have for some years made a feature of *B. cocoonia*, and have found it very satisfactory when grown in large boxes. In this case the house is furnished with Ferns, principally *Nephrolepis* and *Adiantum*. With dot plants of *Andra Savitzii*, these make a capital undergrowth for the pendulous blooms of the *Begonia*, which bring in great profusion from all parts of the roof. Our treatment in the spring consists of pinching off any blooms and giving the plants a little rest. Afterwards they are overhauled and all old, rough pieces of stem cut out, leaving in the healthy and vigorous young shoots. In this way the plants are kept in good condition. The soil in the boxes is pricked over, as much of the old soil as possible is taken off, and a rich top dressing put on in its place. The plants quickly respond to this treatment, and with extra warmth will grow quickly as the days lengthen. During the summer months the growth root be regulated over the roof space, keeping it somewhat thickly dressed in subsoil, top dressing, and plentiful supplies of water when the plants are in full growth, are necessary.

GREENHOUSE CLIMBERS. Climbing plants grow very rapidly during summer, and unless given constant attention quickly degenerate into a tangled mass of growth, which has a tendency to become dirty. Cut out all the weak shoots, and reduce the number of healthy growths, disposing of the remainder thinly in the space at command. It should be borne in mind that the roof of the greenhouse or conservatory should not be entirely covered with creepers, as this would make it too dark for the plants underneath. As a rule, a restricted space under the rafters should be utilised, leaving a certain amount of open space between. At this season abundance of water will be required, and where the climbers are in boxes or very small borders, some artificial manure should be given to keep the plants in healthy growth. Liquid Farmyard manure and sod water are beneficial, but in conservatories these materials may be objected to, hence the preference for artificials. Fumigate regularly as a preventive of aphid.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher. — Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations. — The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Local News. — Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 59.5.

ACTUAL TEMPERATURE —

Forficula auricularia, the common earwig, often enough a minor pest in British gardens,

The Earwig.

appears to have become serious in Newport, Rhode Island, U.S.A., in spite of the fact that it was first observed there as recently as 1911.

The female lays from 50-90 shiny white eggs, each of about 1-20th inch in length. A favourite site for egg laying is mellow garden soil, where may be found, some 2-3 inches beneath the surface, both eggs and hibernating females. This in winter; in spring the young earwigs may be found in the ground, or at night on the surface. Except for the lack of wings, they resemble the adult insect. At first white, their colour darkens to a shiny olive-green. In June they are dusky olive-green or steel-grey. After four larval stages the adult form is assumed. The young larva feeds on tender shoots of grass, clover, and, of course, of garden plants, such as the buds of the Dahlia. Mr. Jones states* that the adults feed almost entirely on the petals and stems of flowers; but in this country they are not averse from the young leaves of Nectarines, and of not a few herbaceous plants. They are also cannibals and scavengers, devouring dead and dying earwigs, dead flies and sluggish larvae.

Their congregation near food plants in crevices in late summer is a result of the mating instinct. Adult males do not generally survive the winter of Newport, but die in autumn after having fertilized the females; but, as before stated, the adult females hibernate in the ground, at a depth of from 2-8 inches. The eggs also survive the winter. Hens devour earwigs ravenously, and toads are fond of them; but, unfortunately, the earwig is an adept at concealment during the day, so the hens are at a disadvantage. The numbers

of earwigs at Newport are so great as to be a nuisance—in some districts, on opening the awning of a house, a pint of earwigs may be collected at a time.

Poisoned bait consisting of stale white bread 16 lbs., Paris green 1 lb., and water is effective; but the Food Controller would have something to say if bread were used here for the purpose.

The recipe (which we give for use in times of greater plenty, both of bread and earwigs) is "grind the bread finely in a meat-chopping machine, and mix it with the Paris green whilst dry. Stir thoroughly, adding water sufficient to make the mixture run through the fingers. It should be of such consistency that when thrown broadcast it breaks into fine particles. Spread the bait between dusk and dark, choosing warm evenings.

Instead of bait a contact spray may be used. Good results have been obtained with a spray consisting of soft potash soap, 30 oz.; nicotine sulphate (40 per cent.), 20 teaspoonfuls; water, 96 oz.

The soap is dissolved in a little water over a fire, and the rest of the water and the nicotine sulphate are added. This stock solution is diluted before use by the addition of 22 parts of water to 1 of the stock solution.

If flower-pot traps are used, the catch of earwigs may be got rid of each day by immersing the pot in water over which a little kerosene oil has been poured—enough to form a film on the surface of the water.

A MUNIFICENT GIFT.—SIR HARRY JAMES VEITCH has forwarded to the Secretary of the Gardeners' Royal Benevolent Institution a cheque for £500, accompanied by the following letter:—"Dear Mr. INGRAM. Twenty-five years ago my wife and I had the great pleasure of giving a 'Silver Wedding' thank-offering of £500 to the funds of the Gardeners' Royal Benevolent Institution. God in His great mercy has spared us to commemorate now the 50th anniversary of our wedding, and we have very much pleasure in sending as a 'Golden Wedding' thank-offering a similar amount to that we gave in 1892. I shall be glad to hear that the enclosed cheque for £500 reaches you safely. My wife and I hope the Committee will treat this donation in the same way as that we sent on the previous occasion."

PROFESSOR KEEBLE AND THE NEW ORDERS.—PROFESSOR FREDERICK KEEBLE, F.R.S., the Scientific Editor of the *Gardeners' Chronicle*, has been created a Commander of the Order of the British Empire, for having "rendered valuable services to the Food Production Department."

GOLDEN WEDDING OF SIR FRANK AND LADY CRISP.—SIR FRANK and LADY CRISP, whose garden at Friar Park, Henley-on-Thames, is known far and wide in the horticultural world, have just celebrated their golden wedding. By way of celebrating the occasion, they entertained at Friar Park all the inmates of the Poor-law Institution, and Lady CRISP also presented to St. Mary's Church, Henley, a silver-gilt chalice.

NATIONAL ROSE SOCIETY.—Instead of the usual autumn show, the National Rose Society will hold a non-competitive display of Roses in the London Scottish Drill Hall, Buckingham Gate, Westminster, on Tuesday, September 11, from 1 to 6 p.m., in conjunction with the fortnightly meeting of the Royal Horticultural Society. Awards of medals and certificates will be made to such exhibits which the judges may

consider worthy. There will be three divisions—one for new seedling Roses, one for nurserymen, and one for amateurs.

MR. W. W. PETTIGREW.—The Food Control Committee of Manchester has appointed Mr. W. W. PETTIGREW chief officer to the committee. While Mr. PETTIGREW will devote his main energies to the work of the Food Control Department, he will continue in his office as superintendent of the local public parks. The *Manchester Evening News* states: "It is agreed on all hands that a better appointment could not have been made. Since he came to Manchester Mr. PETTIGREW has shown himself not only a capable organiser, but an exceedingly able Corporation servant in many other directions. His work on the Foodstuffs Committee, like that on the Parks Committee, was invariably characterised by a thoroughness which has been beyond criticism."

FIRE AT MESSRS. W. WOOD & SONS.—On Monday last, the 27th ult., a destructive fire occurred at the Wood Green premises of Messrs. W. WOOD AND SONS, horticultural sundriesmen. Some thousands of pounds' worth of damage was caused, but we are glad to learn that, owing to the location of the conflagration, only a portion of the building was damaged, and Messrs. WOOD AND SONS are able to carry on their business and supply their customers as usual.

PRUNUS PISBARTII FRUITING.—This handsome ornamental-leaved tree is a familiar feature of our gardens, and reports of its fruiting this season have reached us from several districts. We hear from Lady THEODORA GREST that this year it has fruited in her gardens at Inwood, Templecombe, for the first time. The fruits are deep crimson, and add much to the beauty of the tree. She also informs us that Yuccas have flowered unusually well, one plant having thrown up ten splendid spikes.

SOUTHERN VEGETABLE SHOW.—The local food production society at Southend-on-Sea will hold an exhibition of garden produce on September 14 and 15. The schedule includes some thirty classes for Vegetables and six for Fruit. Two of the Vegetable classes are open to all allotment holders. One is for a collection arranged on a space 6ft. by 4ft., in which prizes amounting to £12 are offered; the other for six kinds, in which the prize money totals £9. The hon. secretary is Mr. G. F. TINSLEY, "Lomea," Westbourne Grove, Westcliff-on-Sea.

IMPORTS OF FRUIT FROM FRANCE.—A general licence has been issued to the Customs Authorities permitting the importation of all kinds of fresh fruit and vegetables from France into this country.

MR. THOMAS STEVENSON.—MR. THOMAS STEVENSON, who has been for some years past head gardener to E. MOCATTA, Esq., at Woburn Place, Addlestone, Surrey, is shortly leaving private service to take up a position with Messrs. LOWE and SHAWVER at their nurseries at Uxbridge. MR. STEVENSON joins the firm, as one of the directors, on October 1. He is well known as a successful cultivator; as an exhibitor of Sweet Peas and Chrysanthemums he is world-famous, but these are only two of the many subjects he grows so well. MR. STEVENSON is a member of the Floral Committees of the Royal Horticultural Society, the National Chrysanthemum Society, and the National Sweet Pea Society.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See also Tables in *Gardeners' Chronicle* for July 28.)

(Continued from p. 82.)

5.—ENGLAND, S.

MIDDLESEX.—Crops of Apples, Pears and Plums are somewhat patchy. Some trees are bearing very well, and others are considerably below the average. Peaches, Strawberries and Gooseberries were exceptionally good, but the season for Strawberries was short, owing to want of rain. Our soil is light and shallow, and needs a good deal of manure. Caterpillars have been most troublesome during the past two years, no matter how carefully the trees have been sprayed. *H. Markham, Wrotham Park Gardens, Barnet.*

— Apples, generally speaking, are yielding light crops this year in cases where they were heavy in 1916. Exceptions are the varieties Keswick Codlin, Lord Suffield, Worcester Pearmain, James Grieve, Striped Beefing, and Warner's King, which bore heavy crops last year, and are equally good this season. Pears are very good; in my garden not more than two out of fifty-five varieties have failed. *W. P. Spurr, Marsh Farm, Twickenham.*

SURREY.—Apples flowered freely, but heavy storms unfortunately spoilt the blossom a few days before setting. Pears, although damaged by insect pests, promise clean, fine fruit. The Strawberry crop suffered by the severe winter; many plants barely survived, and continued rains shortened the duration of the crop. The soil here is light and sandy. *James Cook, West End, Lodge Gardens, Weybridge.*

— The fruit crops here are good, except for Apricots, which are very unsatisfactory. Wall Pears are poor, but other trees are average. Black Currants suffered rather severely from "big bud." The Strawberries were poor, as they suffered from early drought. The soil here is sandy loam on chalk and very porous. *W. Payne, Norbury Park Gardens, near Dorking.*

— Apples bloomed profusely, but on old trees the fruits dropped, as they were attacked by caterpillar. Plums were plentiful on trees not touched by bullfinches. Strawberries (except Louis Gauthier) suffered owing to the dry weather. Gooseberry mildew is disappearing, but the tips of the shoots are cut off early in September. *James Watt, Myrthall Gardens, Reigate.*

— The trees here were dressed with winter wash in February, but a remarkable show of bloom was followed by one of the worst attacks of caterpillar I have ever seen. Plums and many Apples were completely stripped of all foliage. *F. Jordan, Ford Manor Gardens, Lingfield.*

— There was an extraordinary promise for fruit of all kinds, but most of the Apples, Pears and Plums fell off during the hot weather. Insect pests were also very bad. *S. T. Wright, R.H.S. Gardens, Wisley, Ripley.*

SUSSEX.—The Apple crop was reduced to half an average by caterpillar attacks and bad setting combined. Plums were average, excepting *Czar* and *Pond's Seedling*, which fruited largely last year. An extra crop of *Monarch* may counter-balance the deficiencies. Cob Nuts promise unusual abundance, but may be undersized in consequence of the foliage having been riddled by caterpillars. Our soil ranges from a lightish loam over the Tunbridge Wells sand to a heavy soil over clay and sand. *W. E. Bear, Maybom Down, Hailsham.*

— The late spring retarded blooming, so the trees escaped injury by frost. The warm

weather afterwards caused growth to be very rapid, and on the whole growth was as early as after a warmer spring. The bloom on all fruit trees was abundant, and set well, but caterpillars thinned the fruit. The weather has lately been favourable, and rain seems to come just when needed. The soil here is a rich yellow loam on a gravelly subsoil. *Leon Squibbs, Stonehurst Gardens, Ardingly.*

— Fruit trees in these gardens were a mass of blossom. Unfortunately, as the fruit began to swell, caterpillars appeared, and did much damage to fruit and foliage. Some of the Apple

three weeks later than usual, the result being that the flowering and setting periods were almost immune from frosts, and the weather in other respects was favourable to vegetation. *T. Challis, Herbert Cottage, Wilton, near Salisbury.*

— All kinds of fruit trees flowered splendidly. Apples are not so heavy a crop as was expected; some varieties set very well, but others failed. Strawberries were not quite so plentiful, and were smaller on account of prolonged hot, dry weather after the flowering period was over. All kinds of bush fruits were

FIG. 32. NEW STAR DAHLIAS, ABOVE; EASTERN STAR, BELOW; PRIMEBRO STAR. Both varieties received the R.H.S. Award of Merit on the 10th Dec. (see p. 92.)

and Pear trees were quite bare. Owing to lack of labour very little spraying has been done. There is, however, a good average crop. *J. W. Buckingham, Milland Place Gardens, Liphook.*

— Strawberries in this district were not a good crop; about the same as eight years ago, when the weather was very severe in winter. Apple and Pear trees suffered from caterpillars; Gooseberries also, in some cases, were badly affected. The soil is heavy clay. *Wm. J. Longridge, Otte Hall Gardens, Burgess Hill.*

WILTSHIRE.—In consequence of the severe winter and early spring, vegetation was quite

good. The soil is of a sandy nature. *J. Knight, Boswood Gardens, Calne.*

7.—ENGLAND, N.W.

LANCASHIRE. Following a long and very severe winter, fruit blossom opened strongly and showed great promise, but the prolonged drought in June and the early part of July caused many Apples and Pears to drop. Sufficient fruits remain, however, to give an average crop. Strawberries were very scarce, and soon over. *C. H. Cook, Knowsley, Preston.*
(To be continued.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

TEA PLANTS (see pp. 67, 82).—In the interesting communication by Mr. Henry on the cultivation of the Chinese Tea plant in the British Isles, reference is made to the article on Tea and its Cultivation by Sir George Watt in the *Journal of the Royal Horticultural Society*. I am not a fortunate possessor of this *Journal*, but an exhaustive account of the Tea plant, and the manufacture of Tea is to be found in Sir George Watt's monumental work, *The Dictionary of the Economic Products of India*. Probably these articles are the most complete of any written on the subject. The first, under the heading of "Camellia theifera," extends from p. 70 to p. 85 and gives a long list of "Tea bibliography," followed by a history of China Tea and Indian Tea. A further article is given under the simple heading of "Tea," which covers 65 pages, and deals with area and cultivation, imports, revenue, plants raised in the Botanic Gardens, Calcutta, British and foreign trade, and home and foreign consumption. I quite well remember, in my earlier days at Kew, a Tea plant growing against a wall, either on the eastern side of the wall separating the herbaceous ground from the nursery, or on that which was then known as the Duchess of Cambridge's garden, and consequently with a southern aspect. My memory at this distant period cannot recall the exact locality. *John B. Jackson*.

AMERICAN GOOSEBERRY MILDEW.—One of your correspondents, in his remarks on the fruit crops, states: "Gooseberries are remarkably free from American Gooseberry mildew." This statement agrees with the experience of a friend of mine, who informs me that his plants had the disease previous to last winter, but he has not seen any signs of the mildew since; possibly the severe winter may be responsible for the destruction of the disease, and it would be interesting to know whether readers of the *Gardeners' Chronicle* can confirm this supposition, and if the disease has been found in other gardens where it had not previously occurred. *W. H. Divers*.

VERONICA LOBELIODES.—On page 255 of the issue for June 23 last, your correspondent *J. E.* refers to *Veronica lobeloides* as being a common plant in London. The specific name of *lobeloides* was unknown to me, but I found it referred to in the *Kew Hand List of Toxaria*. *Veronica lobeloides* as synonymous with *V. speciosa*, which is hawked about London by costermongers during the autumn. It is of a compact, freely branched habit of growth, with blue flowers, and will stand most winters in the neighbourhood of London. *W. T.*

DESTRUCTIVE GALES.—Gales of exceptional violence occurred on the 24th ult. and the night of the 27th ult. and throughout the following day. At least half the crop of Apples here of all varieties not picked when the gales occurred have been blown from the trees. About 200 bushels were picked up after the first gale, and, at the time of writing (August 26), there is a still greater quantity on the ground as the result of the second gale. The most lamentable part of the damage is the blowing down of late Apples, such as Cox's Orange Pippin, Charles Ross, Allington Pippin, Bramley's Seedling, and Newton Wonder, as these, and particularly the three dessert varieties, are immature, and not fit for market. As for mid-season varieties, including Worcester Pearmain, Lord Grosvenor, Royal Jubilee, Warner's King, and Lord Derby, their windfalls can be marketed at low prices, provided that empties can be obtained, exceeding the considerable proportions bruised or chipped. But the markets for Apples are completely congested, and prices have fallen so low that it hardly pays to send windfalls any considerable distance by rail. The Pear crop has suffered as badly as the Apple crop. The damage to my Plum crop is only less serious because my acreage of Plums is much less than that of Apples. All varieties of Plums not picked when the gales occurred have been blown off the trees to a serious extent. Those which are mature enough for marketing have been rendered dirty, so that they can be sold, if at all, at only half price,

while late varieties, quite green, are not worth picking up. My loss is all the more remarkable on account of the fact that my orchards are exceptionally well protected by shelter trees and hedges. Gales have occurred in many previous seasons, but without doing a tenth part of the damage now under notice. The peculiarly gusty character of the recent gales rendered them much more destructive than steady gales of nearly equal force have been. It is also to be remarked that September is usually the month for gales, and then the proportion of ungathered fruit is much less in my early district than it is in August. Branches of trees of various kinds have been torn off and hurled to considerable distances, and we shall probably learn that great numbers of whole trees have been blown down. It is impossible to estimate with any approach to certainty the pecuniary loss incurred. There is not only the direct loss to consider, but also the great reduction of prices caused by the glutting of the markets, from which no recovery can be anticipated until all the mid-season varieties of fruit have been disposed of or rotted. *Southern Grower*.

SOCIETIES.

ROYAL HORTICULTURAL.

August 28.—The exhibits at the fortnightly meeting held in the Drill Hall on Tuesday last were very few in number. The weather was in element, and prevented any but the most enthusiastic visitors from putting in an appearance.

Dahlia formed the chief floral exhibits, and the novelties were judged by a joint committee of the National Dahlia Society and the Floral Committee of the Royal Horticultural Society. Several new varieties were submitted, of which eight were selected for award. The Floral Committee also gave an Award of Merit to a pink variety of *Eastonia Russellianum* named *Ellisi*. The groups in the floral section were not so important as usual. The Silver Flora Medal was given to Messrs. H. B. MAY and SONS for *Ferns*, and to Mr. E. J. HICKS for *Roses*. Mr. Hicks showed varieties chiefly of his own raising, including a new Hybrid Tea named *Mrs. Dunlop Best*, which is especially beautiful in the bud stage; the petals are of amethyst tint, shaded in the centre with bluish pink. Dahlias were shown by Messrs. J. CHAL and SONS. Their exhibit comprised the two new star varieties *Eastern Star* and *Primrose Star*, illustrated in fig. 32. The Rev. J. H. PEMBERTON had a stand of seedling *Roses*, including a new Hybrid Musk variety named *Pax*, which has creamy-white, boss-petalled blooms, forming a bold cluster. Mr. C. TURNER, Slough, showed varieties of *Hibiscus sriusius* and *Cleodendron Bungei*, with large coriaceous tubular flowers, red outside and deep pink on the face of the petals. Mr. C. J. ELLIS showed *Eastonia Russellianum*, and the bluish-pink variety referred to above. The novelty was shown grouped with the species, which has flowers of deep mauve with violet markings in the centre of the petals. There were very few exhibits of hardy plants; Mr. H. CLOSE, Orpington, showed bunches of border flowers, and Mr. G. BETTIE Abingdon and hardy plants. Messrs. W. WELLS, junr., showed their new bluish-violet variety of perennial *Aster*, known as *Aster Amelius King George*.

A few good exhibits of Orchids were shown. Awards to novelties included one First class Certificate and three Awards of Merit. In the fruit and vegetable section the most interesting exhibit was a collection of preserved and bottled fruits and vegetables shown by Mr. and Mrs. VERNER BASKES. The Gold Medal awarded to this exhibit was well deserved, for it comprised a great variety of fruits and vegetables, all in the pink of condition, though some of the bottles were marked with the date "1911." A Silver Knightian Medal was awarded to a collection of hardy fruits shown by Messrs. S. SPOONER and SONS of Hounslow. Messrs. LAXTON and BROS. showed a number of new fruits, and gained an Award of Merit for Plum *Titbit*. Another Plum of great merit in their collection was named *Lax-*

ton's Gage, raised from Green Gage crossed with *Victoria*. The colour is greenish yellow, and the flavour is that of the Gage—the tree is said to be exceedingly prolific. The same firm showed a number of new Apples. General French bears some resemblance to *Lady Sudeley*; the parents are King of the Pippins and Blenheim Pippin. Duchess of Bedford is a fine, large Apple, but not of quite so refined a flavour. Messrs. H. CHAPMAN and CO. showed their new Marrow Rotherham Coo, a round custard variety, of a pleasing buff colour. Sir ALBERT K. ROLLIT, St. Anne's Hill, Chertsey, showed a dish of black Figs, for which a Cultural Commendation was awarded. Capt. STOKES, St. Botolph's, Milford Haven, showed bulbs of Sutton's Improved Reading Onion. This exhibit was remarkable in that the seed had been sown in March, 1916, and the crop harvested in August of the same year, so that the bulbs, which were in perfect condition, had been kept for twelve months.

At the three o'clock meeting of the Fellows Mr. H. E. P. HODSOLL gave a lecture on "The Manuring of Garden Crops."

Floral Committee.

Present: Messrs. H. B. MAY (chairman), John Green, George Paul, G. Reuther, W. B. Cranfield, E. Bowles, S. Morris, H. Cowley, A. G. Jackman, J. Heal, C. R. Fielder, J. W. Moorman, J. F. McLeod, A. Turner, W. H. Page, W. P. Thomson, H. J. Jones, C. Dixon, J. Dickson, E. R. Jenkins, and Chas. E. Pearson.

AWARDS OF MERIT.

Eastonia Russellianum var. Ellisi.—A pale pink variety, equal in all other respects to the type, which has mauve flowers. The foliage is cordate, sessile and glaucous. The plants were shown in pots, and made capital little specimens about 18 inches high, suitable for arranging on conservatory or greenhouse stages. Shown by Mr. C. J. ELLIS, Weston super-Mare.

DAHLIAS.—The following varieties of Dahlia received the R.H.S. Award of Merit and the First class Certificate of the National Dahlia Society:—

Eastern Star (see fig. 32).—A charming variety of the "Star" type. The blooms are not large, but they are shapely, and carried erect on long, stiff stems, making them very suitable for vase decoration indoors. The colour is deep, rich mauve, with maroon shading at the base of the florets.

Primrose Star (see fig. 32).—Another beautiful new "Star" variety, the colour being bright primrose-yellow, with the usual long, wiry stem. The disc is rather larger than in most members of the group; in nearly every bloom shown one or two short florets were twisted close to the disc, but they did not detract from the beauty of the flower. Both these were shown by Messrs. J. CHAL and SON.

Bianca.—This large white variety belongs to the Decorative section, and its wide, overlapping florets suggest a white *Water-Lily* without the central cluster of stamens. The variety should prove valuable to florists, the large, pure white blooms being suitable for the making of floral designs. Shown by Mr. CHARLES TURNER, Slough.

Mrs. J. J. Jarrett.—A bold, Paeony-flowered variety of the largest size, and with a larger number of florets than many of the varieties possess. The florets are flat, but rather irregular in size, sometimes waved and sometimes slightly twisted, thus giving the immense blooms an appearance of artistic indifference to florists' standards. The colour is somewhat near the shade known as "flame," with a trace of orange or vermilion. Shown by Mr. J. JARRETT, Anerley.

Golden Rain.—A charming Cactus variety, shape alike in form and colour. The blooms of first rate exhibition size, elegant in build, and coloured clear canary-yellow.

Mrs. Herbert Blackman.—A Cactus variety of full size and good exhibition form. The colour is soft pink, with a white-shaded centre.

Harry Crabtree.—A Cactus variety of particularly elegant and refined form. The centre is pale flame colour, shading into maroon and deep rose-red at the bases of the long, slender florets, and this tone shades off into purplish mauve at the tips.

Meddion. — A happily-named Colerette variety. The full sized blooms are of excellent form, all the segments being broad and slightly overlapping, so as to make up a "full" and rounded bloom. The colour is clear, soft yellow, and the collar florets are of similar tone but with white shading. The outer segments are stained on the back with red-purple, and in some of the flowers this shows through on to the front surface, where, combining with the yellow, it appears as the faintest possible suffusion of orange. These four were shown by Messrs. J. STREDWICK AND SON.

GROUPS.

The following medals were awarded to collections —

Silver Flora Medals to Messrs. H. B. MAY AND SONS, for *Ferul*; Mr. ELISHA J. HICKS, for *Roses*; *Silver Banksian Medals* to Messrs. J. CHEAL AND SONS, for *Dahlia*; and Mr. C. J. ELLIS, Weston Nurseries, Weston-super-Mare, for *Eustoma*; *Bronze Flora Medals* to Mr. H. CROSS, Orpington, for *hardy border flowers*; the Rev. J. H. PEMBERTON, for *Roses*; Mr. G. RETCHE, for *Alpine and hardy plants*; and Mr. C. TURNER, for *hardy plants*.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Vetch, Messrs. Jas. O'Brien (hon. secretary), Bolton, T. Armstrong, J. Chalesworth, Panita Rall, W. H. White, C. H. Curtis, Walter Cobb, Arthur Dee, Frederick J. Hanbury, W. H. Hatcher, R. A. Rolfe, J. E. Shill, and Fred K. Sander.

AWARDS.

FIRST-CLASS CERTIFICATE.

Brasso-Cattleya Lady Vetch (patented unrecorded), from Messrs. FLORY AND BLACK, Slough. A fine hybrid, probably a cross with *B. C. Hene*. The flowers are large, broad in all the segments, and of fine substance. The sepals and finely displayed petals are silver-white with a slight bluish tint and delicate purple markings on the outer halves of the petals. The lip is fringed and bluish-white, with a golden-yellow disc.

AWARDS OF MERIT.

Laelio-Cattleya Canhamiana var. Golden Fleece (Canhamiana × Laminosa), from Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells. The plant bore a spike of four hand-some flowers, in the colour of which the *Cattleya Dowiana aurea* in *L. C. luminosa* prevails. The sepals and finely crimped petals are light yellow. The lip, full at the margin, is flecked with rosy-mauve colour, and there are gold-coloured lines running from the base to the centre, which is suffused with light orange.

Cattleya Mrs. Pitt, Chalesworth, variety (*Harrisoniana × Doaniana aurea*), from Messrs. CHALESWORTH AND CO., Haywards Heath. A richly coloured variety, and the darkest of its class. The spike bore four very showy magenta-rose coloured flowers, the front of the lip being purplish crimson and the disc golden-yellow. The varying shades of colour render the flower very attractive.

Cattleya Naulia exquisita (Hildebrand × Hartwegii), from Messrs. HAYWARD AND CO., Southgate. A beautiful addition to the crosses of *C. Hildebrand* raised at Southgate. The flowers are fragrant and of fine form; the sepals and petals are light yellowish-salmon colour, with a rose shade. The lip is dark crimson with an orange-coloured disc.

GROUPS.

Mr. J. E. SMILL, The Dell Gardens, Enghfield Green, showed *Laelio-Cattleya Golden Queen*, a large and handsome copper-yellow flower tinged with rose colour, and having a broad, magenta-coloured lip; *Cattleya Astron* (Dusseldorf) *Undine × Harrisoniana alba*, and *C. Capella* (Mossian-Wagneri × O'Brieniana alba).

Messrs. CHALESWORTH AND CO. were awarded a *Silver Flora Medal* for a fine group in which *Laelio-Cattleya* and *Cattleya* were specially good. *Laelio-Cattleya Britannia Regina* (*L. C. Canhamiana alba × C. Warszewiczii* (E. M. Beyrodt)) is a noble flower, and the best of their

white-petalled type of this favourite hybrid. The plant bore a three-flowered inflorescence of large, pure white flowers with bright violet front to the lip. *L. C. Serbia*, of model shape and rich in colour, showed well among the graceful sprays of *Odontoglossum* and *Oncotidias*.

Messrs. ARMSTRONG AND BROWN were awarded a *Silver Flora Medal* for a showy group; at the back were finely flowered specimens of their richly coloured *Laelio-Cattleya* (*George Woodham*), arranged with *Brasso-Cattleya* and *Laelio-Cattleya*, the centre being of white-flowered *Cattleya*. *Iris* varieties made a fine feature, the variety *Majestica* being specially good.

Messrs. SANDERS, St. Albans, were awarded a *Silver Banksian Medal* for a group of rare and pretty *Orchids* of botanical interest and a selection of showy hybrids. Attractive varieties of rich colour were *Laelio-Cattleya Longueval* (*C. Dowiana aurea × L. C. Berthe Fournier*) and *L. C. Irensis perfecta* (*C. Iris × L. C. blotchleyensis*).

Messrs. FLORY AND BLACK, Slough, showed a good rosy blue form of their *Brasso-Cattleya Hene*.

Fruit and Vegetable Committee.

Present: Mr. J. Cheal (vice-chairman), Sir Albert Rollit, Rev. W. Wilks, Messrs. E. A. Burnard, A. W. Mottelie, A. Bullock, H. Markham, J. C. Allrove, W. H. Divers, John Harrison, W. Bates, and Owen Thomas.

Plum Utility. — A medium-sized, oval variety, raised from Jefferson's Peach Plum. The flavour resembles that of a Gage variety. A first rate dessert variety. Shown by Messrs. LAXTON BROS.

GROUPS.

A *Gold Medal* was awarded to Mr. VINCENT BANKS for dried and bottled fruits and vegetables, and a *Silver Knightian Medal* to Messrs. S. SPOONER AND SONS, for hardy fruits.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

August 15. The monthly meeting of this Society was held in the R.H.S. Hall on Monday, the 13th ult., Mr. Chas. H. Curtis presiding. One new member was elected. Three members were allowed to withdraw interest amounting to 29/18.

The sum of £76 9s. 3d. was passed for payment to the respective nominees of five members killed in battle; also 29/18 3d. was paid to the nominee of one member who had lapsed for three years. One member was assisted from the District Fund. The sick pay for the month included 4 1/2% 2d. ordinary benefit, £21 10s. 10d. (state) and 29s. maternity benefit.

The special general meeting to consider the Juvenile Section was again adjourned until October 8, 1917.

CROPS AND STOCK ON THE HOME FARM.

RYE AND WINTER BARLEY

For the sheep farmer Rye and winter Barley form an almost indispensable crop, especially where lands are sown in quantity during the early months of the year. In the provision of food there is at times a blank between the finish of the Swedes at the end of May and the grass in June. Apart from a scarcity of food, Rye and winter Barley are useful in providing a change of food for the sheep after eating roots for some months. The wholesale rotting of the Swede crop on some farms this year proved the value of these two catch crops as food for sheep.

Rye and winter Barley should be sown as early in September as possible, to enable the plant to obtain a firm root hold of the soil before the winter rains and frost check growth. Rye sown first, usually follows late Vetches, or sheep feed or ripened winter Barley. This latter can be sown a trifle later, following early Wheat or winter Oats.

Well plough the land twice if this can be done. Where there are many weeds on the surface a

second ploughing may not be possible, as the weeds should be buried and allowed to rot. Pre-part a fine till for the seed-bed by harrowing and rolling if the soil is clodding. Drill 3 bushels of seed per acre, and once narrow after wards.

CLEANSING STUBBLES.

OWING perhaps to a shortage of labour stubbles are more infested with weeds this season than usual, including Thistles, Couch Grass, Convolvulus, Polygonum, and grasses in variety. As fast as the corn is cleared and the weather suitable—dry—shallow plough, or, what is better, use a scarifier or stout cultivator to disturb the weeds to their full depth. With drags and harrows continually move them, disintegrating the soil until the weeds can be burnt in small heaps, spreading the ashes on the surface, for the ash is a valuable stimulant to the future crop. Before the war large fires were made in convenient parts of the field, but now the lighting regulations prevent this method of burning refuse. *E. Molyneux.*

THE BREAKING UP OF GRASS LAND.

The results, as a whole, of this year's cropping on newly broken land have been very satisfactory, especially in view of the conditions attending the work last spring, the inexperience of many farmers in the breaking-up of old grass, and the unskilled labour which had often to be employed. It has been argued that it is hopeless to plough up old grass in the expectation of thereby adding materially to the nation's food resources, but the results reported in the present year do not support this contention. The failures which occurred were mostly in the south and east, and were attributed to wireworm. But most of the damage was primarily due to the drying-out of the newly ploughed soil through lack of proper tillage. Wireworm is most destructive in loose, open soils, and the best remedy is thorough consolidation of the land. The effectiveness of a firm seed bed has also been observed. The benefits due to consolidation were especially noticeable this year because of the long period of dry weather in early summer.

Land newly ploughed should not require manure, and the limited supply of fertilisers available should be reserved for old arable land. However, there are a fair number of cases in which manuring has proved useful.

LAW NOTES.

PROSECUTIONS UNDER THE SEED POTATO ORDER, 1917.

A DURHAM farmer was fined £75 by Sheriff Sym at Perth, on August 6, for selling 35 tons 16 cwt. of seed Potatoes at prices above those fixed by the Seed Potato Order. There were 151 charges, and it was stated that the defendant was liable to fines amounting to £13,200, or imprisonment for 91 years, or both. The defendant pleaded guilty. A number of other cases of a similar kind have been before the Scottish courts, but this is the highest fine yet imposed. The alternative was three months' imprisonment.

At Bow Street Police Court, before Mr. Garrett, Mr. George Howlands Barr, head of the firm of Messrs. Barr and Sons, seedsmen, 12, King Street, Covent Garden, appeared in answer to twelve adjourned summonses for having on various dates, in contravention of the Seed Potato Order, 1917, sold seed Potatoes by retail at prices in excess of the maximum price of 3d. per lb.

It was stated for the defence that Messrs. Barr had acted on the view that under a concession granted to them by the Food Controller they were entitled by their licence to sell any variety of seed Potatoes at a price not exceeding the maximum quoted in their catalogue. It was also pointed out that in the cases where Potatoes of varieties not appearing in their catalogue had been sold, these were only supplied in substitution for others mentioned in the catalogue which were no longer obtainable.

Mr. Garrett said there had been a breach of the Order and of the licence granted by the Food Controller, but that there was no

ground whatever for supposing that the defendant had acted with the deliberate intention of fixing the prices with a view to obtaining unfair profits. He ordered him to pay fines amounting to £15, and £10 10s. costs.

Horticulturists generally who know the high standing of the firm of Barr and Sons, and the esteem in which the members of the firm are held, will note with satisfaction Mr. Garrett's observations.

REPLY.

CURING AND PREPARING TOBACCO.—The following extracts are from an article I wrote some years ago on curing Tobacco, and they are equally applicable at the present time. "When the plant begins to turn yellow or becomes spotted it is time to harvest it. It should then be cut off close to the ground by a single stroke of a hatchet or sharp knife, and, after cutting, left on the ground for a short time to partially wither, when it may be handled without fear of tearing or injuring the leaves, which are next made up into bundles by threading them loosely together and hanging them on poles arranged transversely in a drying house, which may be slightly heated in damp, or ventilated in dry weather. When sufficiently dry the leaves are stripped from the stalk until about one-third of the plant is so collected, when a single leaf is twisted round the stalks to keep them together. These bundles are called "hands." While stripping it is usual to separate the leaves into their distinct qualities, the first of which includes, of course, those which are not torn or discoloured. They are then packed one upon another and subjected to heavy pressure, but care must afterwards be taken to see that no heating or fermentation takes place. In the absence of these eventualities the tobacco will keep good for a long time." *John R. Jackson, Clarendon, Lympstone, Devon.*

ANSWERS TO CORRESPONDENTS

APPLE TO BE RE-GRAFTED: *A. D. F.* We think that you would most successfully re-graft your crab tree with an Apple if you were to shorten some of the main branches and graft on these in the orthodox manner, rather than on the main trunk. If, however, the main stem is healthy, and the bark seems likely to unite satisfactorily, and, as you suggest, make a better shaped tree, since the present branches are so unsymmetrical.

APPLE SUCKERS: *Ravencourt.* As long as you continue to cut off the suckers with a knife, they will grow again, as this method leaves the base intact. The suckers are best removed with what is known as a "sucker-iron," a heavy, blunt instrument, which tears them out, including the base, which is dragged out of the stem. They may also be pulled out bodily by hand.

APPLES DISEASED: *Correspondent.* Your trees are affected with Brown Rot disease, which is illustrated in fig. 33. Particulars of this disease, with the latest methods of treatment, were published in last week's issue, p. 76.

CALIFLOWERS EATEN: *T. B.* The grubs were probably weevils. Treating the soil with bi-sulphide of carbon or Vaportite will help to get rid of them, but the best way to catch them is to go out at night with a lantern and flash it on the plants, having first spread beneath them a layer of sticky paper. The insects, surprised by the light, will drop on to the paper, and can then be destroyed. The pests may, on the other hand, have been Cabbage maggots (see p. 80, in the issue of August 25).

CINERARIAS: *Incurios.* It is not to be wondered at if new Cinerarias, very highly cultivated and carefully selected, should fail to set seed as freely as the lax-flowered *Stellata* type,

which is nearer to the natural species. The few seeds which you have saved can be sown at the present time, as their germinating properties are not likely to improve by keeping. It might help if you were to flower the plants rather later than has been your habit. Further, plants which are grown for seed are commonly cultivated in comparatively small pots, the idea being not to encourage great vigour in the plants, which would tend rather to make them produce foliage than to throw up flowers. The plants should not be exposed to hot sunning, but be slightly shaded in the middle of the day when the sun is extra hot. These and many other points can be found out by experience, and if you persevere in experimenting, you will gradually be enabled to save a greater quantity of seed.

FUNGUS ON LAWN: *J. P.* The condition you describe is probably what is known as a "fairy ring," caused by the mycelium of several species of fungus, which impoverishes the grass in a circular patch. This patch increases in size each year if the fungus is not destroyed. Choose a day when the soil is wet, and the roughly soak the ground with sulphate of iron in the proportion of one pound to a gallon and a half of water. Apply two or three times more, at intervals of about a fortnight, with a solution of half the above strength. Lifting the

therefore when the ground is next dug apply a good dressing of some ground insecticide, such as Vaportite.

NAMES OF PLANTS: *W. M. F.* We do not undertake to name varieties of Roses.—*Roslyn.* *Pilea Spruceana*, a native of Peru.—*E. H. M.* (*Carthamus tinctorius* (Saffron Thistle)).

NERITRA DEPRESSA: *J. P.* You do not state your treatment of the plants, but it seems possible that you have grown them in a very warm house, containing too much atmospheric moisture. The species needs plenty of sunlight, and is best grown in a cool frame or greenhouse during the winter, where the temperature is 40° to 45°. In the spring the plants should be moved to a light house with a temperature of 50° to 55°, and given moisture in moderation. It is only necessary to shade the plants during very hot weather, and then only in the middle of the day. They grow best in light, sandy loam.

POTATOS: *C. H.* The Potatoes are affected by wart disease (*Oedomyces leproides*). Notify the attack of this disease to the Board of Agriculture, 3, St. James's Square, London, S.W., from whom you will receive a leaflet telling you what treatment to adopt.—*B. A. H.* We do not undertake to name Potatoes. It is almost impossible to do so from tubers only; it is necessary to see also the habit of growth,

FIG. 33.—BROWN ROT DISEASE OF APPLE.

A moulded fruit of the previous season affecting sound fruits of the present year.

turf with a fork enables the solution to penetrate the ground more readily. Take care to treat the ground just outside the ring, as the fungus will probably have penetrated further than the actual disfigurement of the turf.

GALLED RUSH: *M. J. H.* The Rush you sent is *Junca sylvaticus*, Reichard (syn. *J. acutiflorus*, Ehrhart). It is not fasciated in the ordinary sense, but galled by an insect named *Lixia punctum*, Latr., and in this respect resembles the wheat ear lamination. Each cluster of leaves contains one larva of the insect, but a stem may bear three to eight clusters of leaves. Yours bore six, and the leaves were tinted with red, but they may be green when much covered with Rushes, grasses, and other vegetation. Other Rushes may be galled in the same way, including *J. articulatus*, of Linnaeus (syn. *J. limnocarpus*, of Ehrhart), *J. bulbosus*, of Linnaeus, and *J. squarrosus*, of Linnaeus. The first two, namely, *J. sylvaticus* and *J. articulatus*, being tall, are used for thatching corn stacks in the north of Scotland, where they are known as sprots. Bogs are sometimes entirely covered with them, and the galls may be found there or on moors or heaths that are more dry but peaty.

GUBBS: *W. G.* The grubs are "cut-worms," the larvae of the Heart-and-dart Moth. The moth lays her eggs on leaves near the ground,

height of haulm, colour of flowers, and other details only to be determined by someone on the spot.—*P. E. N.* Allow the plants to become mature before lifting the tubers, which are always smaller than those raised from established varieties. They can be kept, as you suggest, in sand, but examine them from time to time, and if they seem to be deteriorating it will show that the conditions are too moist, or too dry, and should be altered. As there do not seem to be many of the seedling tubers you might make a small clamp in a dry part of the garden, such as under a wall facing east. You will find directions for making a clamp in the issue for August 25, page 75.

TOMATOS: *Miss C.* Your Tomatos are evidently attacked by the fungus *Cladosporium fulvum*, or Leaf Mould. Pick off and burn all the diseased leaves, including all which have little brown spots on the underside, and keep the house in which the plants are growing well ventilated. Next season spray the plants early in their growth with weak Bordeaux mixture or potassium sulphide, as a preventive.

KER'S, LTD.

There will be no change in the Management. **MR. ROBT. B. KER** will have associated with him **MR. ROBT. W. KING** and **MR. T. LAKE BAKER**. Telephone: Royal 3066. Write for List.

PLANTS, &c., WANTED.

WANTED choice Fruit, Flowers, and Vegetables, best market prices returned, boxes, &c. and surplus stock from Gardens accepted.—**MORRE & CO.**, 150-152 Finchley Road, N.W. 3.

WANTED, 1,000 Large ASPIDISTRAS. See old plants suitable for stock, cash or exchange. See other advertisements; catalogues free.—**SMITH**, London Fern Nursery, Loughborough Junction, London, S.W.

MISCELLANEOUS.

THEY'RE NOT STICKY.

Beau's is the only adhesive from any stickiness, and, when used, is completely invisible. It will keep the hardest man or set of hundreds of letters, name-cards, and other outdoor mail, window, and other things; them it means they being weather-proof. You ought to wear them if you want to keep dry in any deluge. The Beau's Booklet will help you to choose the style you need. Chisholm's Cards from the old. Men's from 10s., Ladies' Smart outfits, 45. Your money back if you are not satisfied with our service. Send a postcard today for our Free Booklet of "Weather-Proofing." Send now, but do not forget to **BEAU'S S. LTD., 60, BEACON BUILDINGS, SOUTH SHIELDS.** (2)

SITUATIONS VACANT.

Four Lines 3s. (Head-line counted as Two), 6d. for each succeeding line.

PRIVATE.

WANTED, HEAD WORKING GARDENER—one who others are kept, must have thorough knowledge of all branches of Gardening, including Potting, Pruning, Mowing, Fencing, and all other duties. References and other particulars, Book Garden, &c., 25, Essex Street, and 10, Park Road, give in full to our confidential Secretary, and have good references. Write, stating age, experience, &c., and wages required, to **Z. O. 2, 288, S. B. House, 2, Backhill Street, E.C. 5.**

WANTED, 24hr. first-rate HEAD WORKING GARDENER—a single-handed, or married, man, with 10 years' experience in all kinds of large Houses, and Pleasure Grounds (long under). State age, weight, wages, references.—**WINEY**, Ruckington Hill, Gosport.

WANTED, immediately, HEAD WORKING GARDENER, excellent cottage and garden. Walsall. State age and all particulars to **ANSTEE**, Show House, Dinnington.

WANTED, HEAD WORKING GARDENER, good all-round man; married, intelligible, and under 40 years of age, country, and cottage and wages about 30s.—Write fully, to **HARDY**, Falbeck, near Grantham.

GARDENER wanted to take charge four Greenhouses and private Garden, with experience Anne Ross, Chambers, Lambtons, &c.—**ERNEST KING**, 45, Victoria, Clapham, S.W.

WANTED, SINGLE HANDED WORKING GARDENER, small amount of Glass, good cottage. **WYNHAM SMITH**, Stratford, Hereford.

GARDENER—Wanted, a good man for general Garden work, including for Service or disengaged soldier, wages 30s. per week and modern cottage rent free if married, must have first-class character. Apply with full particulars, to **HEAD GARDENER**, Garden Manor, near Watford, Herts.

WANTED, married GARDENER, no timber, residential, interview necessary. Apply at 11, Friars, &c., to **A. W. MILLER**, Forest Hill House School, Home Oak Road, Forest Hill, S.E.

WANTED, SECOND GARDENER, intelligible, experienced Inside, good wages to suit, if married, good cottage found. For particulars, apply **F. G. GERRISH**, Penderly Manor, Gardens, Tring.

WANTED, UNDER GARDENER, single, intelligible, boots, knives, &c.; good wages. Apply, **MRS. DODD**, Church Hill, Pictoria, Surrey.

WANTED, UNDER GARDENER for outside. Apply, stating age, wages required, to **J. MANSELL**, Bishamstead Hill Gardens, Birkhamstead, Herts.

REQUIRED, Strong Lad as UNDER GARDENER, age 17, room provided, others kept. State age and particulars of experience to **HON. MRS. C. COLDRIDGE**, Nonchuck Hall, Chesham, Surrey.

WANTED, FOREMAN, competent man; intelligible, 2nd class and cottage, also three or four extra hands. Full particulars, apply, **W. HOBBS**, The Lodge Gardens, H. Esq., near Madingley.

WANTED, FOREMAN or good capable Man, to take charge of Glass, 30s. per week; for extra duty and overtime paid. **BENNETT**, Snelshill Road, Ashburton, Devonshire.

WANTED, FOREMAN; good general experience, wages 25s., Boots, &c.; also strong LAD for 12 to 15 hours, both day and extra for Sunday duty. Apply, **HOWARD**, Bannan & Green Gardens, Westbury, Wiltshire.

WANTED, FOREMAN, good all-round, to take charge of House and superintend outside work of Gardeners abroad in Army, single, intelligible, 2nd class, good boots, &c.; family, to **A. HASTON**, Birmingham Hall, Aylesford, Suffolk.

WANTED, JOURNEYMAN, for Inside & Outside work, intelligible, age 20 to 25, wages 25s. per week, with Boots, &c. Apply, **W. THOMAS**, 11, J. FOSTER, Grantham, Northamptonshire, Grantham, Leics.

WANTED, good JOURNEYMAN, to assist in House, 1st class, or suitable man; boots and wages for full particulars, apply to **THOMAS STUBBS**, Chesham, Bucks, St. Albans.

GOOD JOURNEYMAN wanted; intelligible, for House or outside, wages 28s., with Boots, &c., and vegetables. Full particulars to **HON. MRS. C. COLDRIDGE**, Nonchuck Hall, Chesham, Surrey.

WANTED, JOURNEYMAN (intelligible), for 10 hours, wages 24s. per week, Boots and vegetables, day and extra. **C. FAIR**, Somerfield, Leamington, Kent.

WANTED, JOURNEYMAN GARDENER, or disengaged soldier with general experience, wages 25s. per week, with Boots and other references. Single, 4th class, good extra. Apply with full particulars to **HEAD GARDENER**, Lambton Castle, Fence House, Durham.

WANTED, JOURNEYMAN (Inside and Outside) for 10 hours, wages 24s. and vegetables, apply, with full particulars, to **H. SWAIN**, The Gardens, Walton Park, Boreham, Bucks.

WANTED, experienced MAN for 10 hours, 1st class Garden work, wages 25s. per week, with Boots, &c. State wages, &c., for particulars to **GARDENER**, Mill House, Boreham, Essex.

GARDENER and HANDYMAN wanted; man sharp in. Apply, **MR. HUTCHINGS**, The Orchard, Dulwich Common, Dulwich.

WANTED, four LADY GARDENERS; one to manage and two partially trained, own cottages, ready and light, near London. Good testimonials, state names asked, and full particulars, to **MRS. N. PARK PLACE**, Hensley on Thames.

WANTED, LADY GARDENER, with some experience, good wages, help given.—**TIDD**, Chesham, Ashley Rise, Walton-on-Thames.

PHENOMENAL SUCCESS OF BULL'S SHRED.

We have for years been very large growers of Bulbs, and can supply Tulips, Narcissis, Crocus, etc., in first-class quality, and probably in greater variety than any other firm. Write for catalogue to-day. Awarded GOLD MEDAL for Tulips by Royal Horticultural Society, April, 1917.

POPULAR EARLY FORCING TULIPS.

(These are very scarce).

CRAMOISIE BRILLANT. Dazzling vermilion-scarlet	1/6	10/6
KEIZERSKROON. Brilliant scarlet, edged yellow...	2/9	10/6
LA GRANDEUR. Brilliant scarlet	1/9	12/6
LA REINE. Pure white, flushed pink	2/1	15/-
MOUCHERON. Deep glowing scarlet	1/8	12/6
PRESTIGE LINCOLN. Distinct light violet	2/-	14/-
PRINCE OF AUSTRIA. Superb orange-scarlet	2/3	15/-
PRINCE DE LIGNY. Deep golden yellow	1/9	12/6
PRINCESS HELENE. The finest white tulips for forcing	2/3	15/-
ROSE GRIS DE LIN. White, shaded rose	2/3	16/-
ROSE OF HOLLAND. White, flushed pink	1/6	10/6
THOS. MOORE. Dark terra-cotta	2/-	14/-
WHITE SWAN. Pure white	2/-	14/-
YELLOW PRINCE. Pure off-yellow	2/-	14/-

EARLY DOUBLE TULIPS.

LADY PALMERSTON. Deep rose, flushed white	1/9	12/6
MURILLO. White, flushed pink	2/3	18/-

POPULAR COTTAGE (MAY-FLOWERING) TULIPS.

BOUTON D'OR. Very deep yellow	1/8	10/6
GESMILIA. LUTE. Bright yellow	1/6	10/6
Flowers	1/6	10/6
GOLDEN CROWN. Deep yellow, red edge	1/3	8/-
INGLESBOMB PINK. Pink, shading to buff and white	1/6	10/6
MACROSYLLA. Intense crimson-scarlet	1/1	6/-
PICTOETE. White, edged cerise	1/3	8/6
FINEST MIXED TULIPS, all sections, an extra fine mixture	5/-	

POPULAR DARWIN TULIPS.

AOOLPHE VAN DEN NEEDE. One of the best brilliant scarlets	1/9	12/6
BARONNE DE LA TONNAYE. Deep rose, margined light pink	1/9	12/6
CLARA BUTT. Delicate salmon-rose, the most beautiful scarlet	1/6	10/6
Good strong flowering bulbs for bedding	1/7	7/6
G. DE GOROUSS. Dazzling Turkey red, very early flowering	1/6	10/6
LA PETITE BLONDINE. Lique, shaded blue	1/9	12/6
LOVELINESS. Beautiful satiny-rose	1/9	12/6
MARGARET. Silvery white, interior rose-pink	1/3	9/-
MR. FARGONNEC SANDERS. Rich cochineal-red, white base	2/-	16/-
MRS. POTTER PALMER. Glowing purple-violet	2/3	16/-
PRIDE OF HAARLEM. Rich glossy cerise, early	1/9	12/6
REV. EWBANK. Brilliant yellow and light edged	2/6	17/6
SAT-ON-KING. Dazzling soft scarlet, white base	1/6	10/6
THE SULTAN. Glossy maroon-black	1/9	12/6
WHITE QUEEN. White shading to blush, a grand variety	2/3	16/-
WM. COPLAND (Sweet Lavender) Blush-lilac, the best of all for forcing	2/6	17/6
MIXED DARWINS, from all the best named varieties	1/2	8/-

POPULAR VARIETIES, DAFFODILS (Narcissis).

BARRI CONSPICUOUS. Primrose, orange-cup edged	...	4/6
C. J. BACKHOUSE. Yellow, orange-scarlet cup	1/6	10/6
EMPEROR. Yellow trumpet, top size	1/6	10/6
OO. Good strong flowering bulbs	...	12 8/8
EMPRESS. White perianth, yellow trumpet, top size	...	11 12/6
OO. Good strong flowering bulbs	...	12 9/8
FAIRY QUEEN. Pure white, a lovely variety	1/9	12/6
GOLDEN SPUR. Deep yellow, grand border	1/8	12/6
OO. Flowering bulbs	1/2	4/-
GRANDE. Large white, yellow trumpet	1/7	7/6
HENRY IRVING. Deep yellow trumpet, early forer	1/6	10/6
MRS. LANGTRY. White, cup edged yellow	1/7	7/6
ORATUS. The early forcing Poet-Narcissus	9/6	5/6
OO. Good flowering	7/1	4/-
POETICUS (Dwarfing Eye). The late variety	...	5/3
PRINCEPS. Yellow trumpet and sulphur perianth	10/6	5/-
SIR WALKER. Bright yellow, very large flower	1/6	10/6
OO. Strong flowering bulbs	1/7	7/6
VICTORIA. White with yellow trumpet, extra fine	1/9	12/6
OLD ENGLISH DOUBLE DAFFODIL (Teloneus Plenus)	1/9	12/6
DOUBLE WHITE POETICUS.	7/1	4/6

CROCUS.

Very fine mixed, all colours	...	2/9 5/-

NOTES FROM A GALLOWAY GARDEN.—X.*

MURMURUS have been heard again the profession of Rambler and Wichuraiana Roses; people complain that Dorothy Perkins is too much with us, that Blush Rambler takes up too much room. For my part, I cannot but feel grateful for the gaiety which these cheap and easy plants have imparted to suburban and cottage gardens. There are, undoubtedly, some inferior varieties that should be struck out of the long list, such as the highly objectionable Crimson Rambler; but there are three with which I would not part except under duress—Léontine Goyale, American Pillar, and Carmine Pillar—and to proscribe Dorothy Perkins and Hiawatha would rob the wayside of many a cascade of clear rose and crimson.

Autumn is now at hand, and one sighs for the profusion of flowering shrubs which gladdened garden and woodland in spring and early summer. I was once asked by the lady of a lordly demesne in the north to take counsel with her gardener about improving the grounds. Seeing that the situation was close to the sea, well sheltered from the worst winds, and that the soil was favourable, it seemed to be the very place for choice species of Rhododendrons. I said so, but was met by the objection "the worst of Rhododendrons is that they will not flower when the family is at home." I am afraid there is no remedy for the sad tactlessness of the genus; but there really is no reason for scarcity of blossom on other shrubs in autumn if some care be taken to provide for it. The following list, though not exhaustive, contains the chief shrubs on which we rely for display from the beginning of August onwards. It is true that in a more southerly latitude than ours, some of these plants are at their best a fortnight or three weeks earlier than in Scotland; but on the other hand there are desirable shrubs like Hibiscus syriacus, Caryopteris Mastacanthus, and Parosela atriplicifolia, which flower too late to be relied on in a northern climate.

* w. Adonhis megacarpus, scarlet and yellow.
w. Absolutus purple, white and pink.
w. Arabis chinensis, white.
w. Budding variegata magnifica, purple.
w. Berberis vulgaris (variegata), crimson.
w. Ceanothus Gloriosae Venouillei, lavender.

- Spergulum junceum, yellow.
- Spiraea Atkinsonii, white.
- Spiraea Douglasii, pink.
- Spiraea japonica, rose.
- Veronica japonica, var. cincta, purple-lobelia to white.
- Volubilis coccinea, white.

Plants requiring the support and protection of a wall have not been prefixed. Besides those in the list there is a Spiraea, introduced from China by Mr. Wilson, whoseof I have not yet the name. It is a noble shrub, sending up leading stems to a height of 15 feet, with a long succession of splendid panicles of snowy bloom.

I have carefully excluded from this list all the Knot-woods, though two or three of the large species bear beautiful flowers in autumn. It was inevitable that among the host of new species brought from Asia during the past fifty years there should be many scenes and robbers. It was under an evil star that Polygonum cuspidatum, P. polystachyum and P. sachalinense landed on our shores. Bitterly have some of us paid for our stupidity in admitting them to the borders, picking out choice places for them as for growths gracious and good, and grievously have our backs arched after hours of toil in vain attempts to rid the soil of the many-jointed ones. They are as troublesome in wood and as in the garden, overtopping open spaces with incredible rapidity, and forming or shading priceless young Rhododendrons and other shrubs. P. polystachyum (fig. 34) certainly is a lovely thing when it clothes itself in late September with a tracery of white lace-work, but the price it exacts for the display is exorbitant.

In a former paper I referred to the beauty of spontaneous hybrids between Primulas Bulleyana, polycorollata, and japonica. Some very pretty hybrids appear in the borders from time to time arising from a cross between the yellow-flowered perennial Foxglove, Digitalis ambigua, and the wild biennial Foxglove, D. purpurea. The flowers are in varying shades of apricot and rose. Hitherto I have never succeeded in finding seed on these crosses, although some of them tend to perennial habit, but this year there are some capsule swelling in a promising manner upon one plant.

It is not many years since the Himalayan Roseana purpurea was the only species cultivated in this country, and very much so it valued by those who care for distinct types. Some of the new species obtained by Boss, & Co., are still more desirable. R. caudoides has proved a treasure, and we have raised a good stock of it from seed, whoseof it ripens abundance. The plant flowers in June, and now has almost an exact later counterpart in one sent out by Boss under the name of August Beauty. The colour of the flowers is the same pale sulphur; the plant has the same erect habit and clasping stem-leaves, but it grows some 6 inches taller than the other. A very pleasing contrast is

secured by planting alongside of it Adenophora megalantha, with light blue bells. Roseana capitata is another August-blooming species of great merit, its rich, royal purple rather putting one out of concert with the old R. purpurea, which flowers at the same time. All species have a similar apparatus of levers for bringing down the anthers on the lack of an intrusive bee, thereby securing cross-fertilisation. Also, all species have the peculiarity of not showing above ground until they are ready to flower. Their dwelling place, therefore, should be marked by a substantial label, else the roots are sure to be injured or thrown out in weeding.

Two other late-flowering perennials claim notice in the August border, and are not to be seen in as many gardens as their merit entitles them to be. One is the North American Stenanthium robustum, a liliaceous plant, sending up its long white plumes to a height of 4 feet, commanding the attention of visitors unfamiliar with it. It rejoices in moist soil, being impatient of heat and drought. The other plant is what we used to know as Rudbeckia pinnata, but are now bidden to call Lappachys. It bears citron-yellow blossoms on wiry stems 5 feet high, and has the grace and self-restraint wherein so many of the true Rudbeckias are deficient. The flowers look like a light of yellow butterflies dancing in the breeze. Herbert Marshall, Monroth.

THE ROSARY.

NOVELTIES IN CLIMBING AND PILLAR ROSES.

The commendable example of Mr. Reginald Cory in offering a series of ten-guinea cups, one to be awarded each year, to the best new seedling Climbing Rose will doubtless be the means of stimulating hybridists in the production of novel types.

Perhaps the definition of what is truly a climber has yet to be made, for surely such a Rose as Paul's Lemon Pillar will climb quite as freely as the ordinary amateur would desire, and many considered this Rose well worthy of the honour of a cup.

The raising of new Roses, especially climbers, seems to be work for the amateur. It was an amateur, Dr. Van Fleet, of the Department of Agriculture, Washington, who raised American Pillar, one of the grandest productions of modern times. This variety originated from a cross between R. Wichuraiana and R. setigera, and all who know the latter Rose will readily perceive that it has imparted its thick, leathery foliage to American Pillar. If a cross between two species can give such a result, what may we not expect in the near future? Another excellent variety from Dr. Van Fleet is one named after himself, and obtained from R. Wichuraiana x H.T. Souvenir du Président Carnot. The flowers are a smaller reproduction of the H.T., and it is a most valuable variety, with mildew-proof foliage. Silver Moon was also from the same raiser, and here we have R. sinica (Chowkei Rose) employed as pollen parent upon R. Wichuraiana, the result being a semi-single flower of large size and beautiful, mildew-proof foliage.

Dr. Williams has been successful in raising some very fine climbers, one especially, Emily Gray, having secured for him the Cory Cup. The variety is a glorified Shower of Gold, and we are all anxious to have it in our collections. I believe that it is to be distributed by Messrs. R. R. Cant and Sons.

Emily Gray, if I mistake not, is the result of a cross between Jersey Beauty and the China Tea, Comtesse du Cayla. When we remember that Jersey Beauty originated from a cross between R. Wichuraiana and the Tea Rose Pierre des Jardins, we can understand the fine golden flowers of Emily Gray.

Another Rambler from Dr. Williams is Lucy Williams. In this case Jersey Beauty was

crossed with the H.T. Edward Mowley. Although the latter has imparted its glorious colour, the influence of the seed parent, Jersey Beauty, has deprived it of a perpetual-flowering character.

Another eminent British raiser, the Rev. J. Pemberton, is working upon other lines. He is evidently endeavouring to give us perpetual-flowering pillar Roses, and his productions, such as Danae, Moonlight, Clytemnestra, and Pax are worthy additions to the garden. I surmise that Mr. Pemberton has been working upon the perpetual-flowering variety Trier, using probably Hybrid Teas or Teas as pollen parents. Perhaps Pax may have originated from Trier \times Madame d'Arblay. I consider it well worthy of a Gold Medal, certainly more so than Moonlight. These semi-climbing, perpetual-flowering, shrub-like Roses are to be welcomed, and it would encourage their raising if some enthusiast would offer a cup. *Walter E. Lea, Eastwood, Leigh-on-Sea.*

seen no instance of any attempt to carry out deep tillage; yet the crops are very good.

The spade employed in digging differs from that used in England. It has a bright blade of good steel, about 11 inches in depth and 8 in width, tapering slightly from hilt to base. The blade is built at a slight angle into a stout, straight, long handle, without "crutch" or "eye." As the soil is light, very little foot work is needed, so that the work is quickly done.

As the plots are rather small, few Potatoes are grown. The chief crop is Haricot Beans. The ordinary French Bean as we know it in England is not often grown, and only in a few instances do we find Runner Beans. Broad Beans are not much in favour. Most of the Peas grown are dwarf, the pods being small, though plentiful and well filled. Nearly every plot has one of its four sides edged deeply with Sorrel. Shallots are grown more generally than Onions, and Garlic to a considerable extent. As one would expect, Lettuces are largely grown, being often used as

EUSTOMA RUSSELLIANUM.

THE exhibit of *Eustoma Russellianum* from Mr. C. J. Ellis at the last fortnightly meeting of the Royal Horticultural Society showed how ornamental is this decorative plant when well cultivated. The species is a native of Mexico, and was introduced into this country in 1804, but for some reason the plant never appears to have become very common in gardens, perhaps because it has the reputation of being a difficult subject to cultivate. With ordinary care and attention, however, it is not difficult to obtain good results. In former years the plant was grown under the name of *Lisianthus Russellianus*, and it has also been known in gardens as *L. erythropensis*, a name under which it was shown and obtained an Award of Merit at the Holland House Exhibition in 1906. The flowers of the type are mauve, but a distinct break, with pale pink flowers, has been obtained by

FIG. 34.—*Polygonum polystachyum*: FLOWERS WHITE.
(See p. 95.)

GARDEN NOTES FROM FRANCE.—II.

By a MEMBER OF THE B.E.F.

A GARDEN VILLAGE.

SOMEWHERE in France there is a fairly large village built on a well-organised plan. Every house has a rectangular plot of garden which is fully cultivated. The gardens are near the houses, though not actually attached. Where there is a dividing fence it is of an open character, which, though it does not ensure privacy, is economical, and obstructs neither light nor air, and does not, like a hedge, impoverish the surrounding soil. As a general rule, the gardens run in a straight line between two blocks of houses, so that they may be described as streets of vegetables. The soil is of a light, rich character, and is liberally supplied with natural manure. Ordinary digging only is done; I have

an intercrop with Garlic and Shallots. The Cabbage varieties are overwhelmingly favoured. Carrots form a considerable crop, but Parsnips and Beet are rarely seen. I do not remember seeing one Marrow in the whole village; but Cucumbers for pickling are grown by everyone, the plants being sown and left exceedingly close together. It seems curious to English gardeners to find that the cottagers in the area traversed by the writer do not grow Cabbages for spring use, nor do they grow Brussels Sprouts, Broccoli, autumn Onions, or early Cauliflowers to any extent. The Loek is almost the solitary occupant of the garden during winter. In the summer the ground is completely hidden from view by the closely-grown crops, but in the autumn and winter the garden is almost bare.

The garden frame seems unknown here.

The village must produce an enormous crop of vegetables, and I should like to see the villages in England take pattern from it.

Mr. C. J. Ellis in his nurseries at Weston-super-Mare. This is illustrated in fig. 36. The plants shown at the R.H.S. meeting were about 18 inches high, but specimens have been obtained with a height of more than 3 feet, and a circumference of 7 or 8 feet, carrying upwards of four hundred flowers and buds. A valuable characteristic of the blooms is that they remain a long time on the plant without fading, some having been found to remain in perfect condition for three weeks.

The plant may be successfully treated as a biennial, by raising seedlings one season to flower the next. The seeds, which are very minute, are sown on the surface of the soil, which should be light in texture. They are covered with a sprinkling of silver sand, and the pots placed in a propagating pit, or covered with a sheet of glass. The utmost care is needed in winter in the matter of watering. When the seedlings are large enough to handle, they should be potted

up singly into thumb pots, the compost for this and all subsequent pottings consisting of a mixture of loam, leaf mould, peat, and a sprinkling of sharp sand. Later they should be transferred to fairly large pots, and grown on in a cool, airy greenhouse. The seedlings require very little shade when once established, and should be wintered in the warm end of the greenhouse, but ventilation should be introduced on every possible occasion, and fire heat used very

ON INCREASED FOOD PRODUCTION.

VEGETABLE PRODUCTION AT ALDERSHOT

Much work is being planned by the War Office and energetically carried out by many leading officers, including Sir Archibald Hunter, General

littled gave 12 and 15 tons per acre, and it is the intention to break up much more land during the coming winter. An exhibition of vegetables from this recently cropped land was held on the Royal Flying Corps ground, Aldershot, on the 25th ult. Their Majesties the King and Queen, as well as other members of the Royal Family, visited the show, and were much interested in the fine produce brought together by the soldiers. The arrangements were carried out by Mr. T. H.

FIG. 5. *HIBISCUS BELLEROPHANTUM*. FLOWERS MAJESTY

sparingly. The stove house, with its hot, close atmosphere, would be very detrimental to the well-being of the plants, a little bottom heat in the early spring to assist the cuttings to strike being usually all the artificial warmth required.

The success attained in the production of this beautiful hybrid should encourage cultivators in the endeavour to produce fresh and equally beautiful new colours in this most useful greenhouse plant, which gives a succession of flowers over two or three months.

G. F. Ellison, and Major F. W. Harding, Newiman, Chief Land Agent, Aldershot Command, by way of increasing the food production in and around the district.

In 1916 only about 21 acres were under vegetable cultivation, but now there are over 351 acres. Much of the land that was broken up during the winter of 1916 was practically devoted to hothouse produce, and waste.

The potato crops are excellent for the first year. The varieties which have already been

Croxford, Sykes' Garden, Holly Hill, Black water. A large collection of fruit was sent by His Majesty the King from Windsor (gr. Mr. A. M. Keller). The exhibit contained about 100 dishes, including bunches of Muscat of Alexandria, Madresfield Court, Black Hamburg, and Foster's Seedling Grapes, Peaches, Apricots, Nectarines, Plums, Cherries, and dishes of Apples and Pears.

An exhibit of Potatoes grown on freshly dug pasture land was sent by the Aldershot Com-

mand: the tubers were shapely, clean, and of good size.

The competitive classes were keenly contested, and much fine produce was staged. For a collection of vegetables of eight varieties, shown in baskets, there were no fewer than 55 exhibits, whilst for Onions there were 37 entries, for Carrots 67 entries, for Turnips 56 entries, for Cabbage 56 entries, and equally good entries for Lettuces, Cauliflowers, Vegetable Marrows, Beet, Runner Beans, French Beans, Potatoes, Tomatoes, Cucumbers, and Peas. *E. B.*

FOOD PRODUCTION AT CLAREMONT.

LIKE most large gardens nowadays, that of Claremont, Esher, has readily responded to the call made up on it to supply a proportion of the nation's food. Mr. J. Kelly has been in charge of the Gardens for the past eight years. Claremont, in peace time, was famous for its flower borders, but these gay features have long been displaced, and vegetables are everywhere dominant. The Antirrhinum border has been planted with Potatos Sharpe's Express, Midlothian Early, and Duke of York. The crop is excellent, and is being followed by winter Coleworts. The Potatos grown for succession are Sir John Llewellyn, British Queen, Burnhouse Beauty, and Witch Hill. Cabbage is represented by Harbinger, Flower of Spring, Sutton's All Heart, Sutton's Main Crop, and Winstedstadt Cauliflowers Earliest of All, White Queen, Early London, Dobbie's Excelsior, Early Giant, and Autumn Mammoth are occupying the border illustrated in *Gard. Chron.*, Oct. 14, 1916, p. 182, when it was planted with Pentestemons. Onions are yielding a heavy crop; the autumn-sown had contains Ailsa Craig, Cranston's Excelsior, and Premier, and the spring bed James Keeping, Improved Reading, and Main Crop.

Winter and Spring Broccoli are prominent, and Savoy's Earliest of All and New Year have a large quarter to themselves. The importance of Brussels Sprouts is duly recognised, and the varieties Dwarf Gem, Exhibition and Solidity are grown in liberal quantities.

As to Peas, never have I seen them to be of better promise so late in the season. The earlier sowings embraced Sutton's First Crop, Pilot, and Matchless; followed by Duke of Albany, Sutton's V.C., Matchless, Alderman, Selected, Peerless, Gladstone, and Autocrat.

Mr. Kelly advocates deeply trenched and liberally manured ground for this crop and planting in rows at 6 feet apart, applying a mulch after staking. Spinach is grown between the Peas and cleared before picking begins. Broad, Dwarf, and Runner Beans are extensively grown, chiefly the varieties Best of All and Prize-winner.

Celery is occupying the Sweet Pea ground; Parsley flourishes where Border Carnations were formerly displayed themselves; and Carrots and Beet respectively fill borders that for years were gay with Stocks and other annuals.

The staff with which Mr. Kelly has to manage consists mainly of boys who have recently left school, and one or two elderly men. His foreman was killed at the front early in the second year of the war. *Thomas Smith, Coombe Court Gardens, Kingston.*

DRYING FRUIT AND VEGETABLES.

IN the ordinary house there exist already the means for drying all the common fruits and vegetables. The Food Production Department has published a free leaflet, which may be obtained on application to 72, Victoria Street, S.W. 1, on "Fruit and Vegetable Drying." By means of this leaflet any woman with ordinary kitchen knowledge can dry Apples, Peas, Plums, Damsons, Cherries, Potatoes, Carrots, Parsnips, Turnips, Swedes, Onions, Leeks, Peas and Beans, Mushrooms, Spinach, Parsley, Thyme, Mint, and other herbs.

The Week's Work.

THE KITCHEN GARDEN

By J. DUNN, Foreman, Royal Gardens, Windsor.

SPRING CABBAGE.—The transplanting of this important crop should receive attention as soon as the plants are large enough for shifting, as early planting will ensure Cabbages for use at a time when other green vegetables are scarce. At Frogmore we make an extensive planting of these young Cabbages as early in September as possible. For this purpose the seedlings may be planted closer in the row than those intended for the main crop, which need not be planted for another fortnight.

WINTER SPINACH.—The plants of Winter Spinach should receive careful attention, or they may soon be destroyed by slugs. If this pest is present amongst the plants dust the leaves freely with soot or lime, and stir the soil with the Dutch hoe on frequent occasions to promote a free growth. If further sowings are made, choose a warm border and rich soil.

ONIONS.—Spring-sown Onions should be lifted as soon as their growth is finished or they may commence to make second growth, which would prove detrimental to the keeping qualities of the bulbs. Lift the Onions carefully and place them on a clean, hard surface. They should be turned daily until ready for removal to a well ventilated store-room. The best ripened bulbs should be reserved for late use, while those of second quality should be used during the autumn and early winter.

CELERY.—Continue to blanch Celery as it becomes necessary, selecting a dry day for the work. Examine the plants carefully, and if the roots are dry water them with clear water at least 24 hours before the soil is applied to the stems. Late batches of Celery will be benefited by a liberal dusting of soot during showery weather.

ENDIVE AND LETTUCE.—Continue to plant Batavian Endive in sheltered parts of the garden and in cold pits, where the plants may remain until required for use during the winter. Use rich soil, brought to within 18 inches of the roof glass. Plant the Endives one foot apart each way, and encourage them to grow quickly by stirring the soil on frequent occasions with the Dutch hoe and dusting them lightly with soot. The lights should remain off until cold weather sets in. There is still time to make a small sowing of Endive to produce plants for spring supplies. This crop should be grown in cold pits throughout the winter where protection from sharp frost may be given. Lettuce should also be planted on sheltered borders and in cold pits for use during the winter. A sowing of a suitable hardy variety should be made for succession. Maximus is a good Cabbage Lettuce for this purpose.

MARJORAM.—If seedling plants of Marjoram were raised last spring and planted out during the summer, some part of the crop should be lifted at once and the plants placed in 6-inch pots for use during the winter and spring. They will grow well in a slightly heated pit on a bed of ashes within 18 inches of the roof-glass.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate.

MASEDEVALLIA.—If a representative collection of *Masdevallias* is grown, some species or hybrids will be in bloom at all seasons. September is the most suitable month for repotting or re-arranging with fresh compost, as the roots are inactive during this period than at any other season. The young roots will quickly grow into the new compost, and become well established before the winter arrives. Healthy specimens which do not need increased roofing space may remain in their present receptacles for another season. If the soil has become sour, it should be picked carefully from between the roots down to the drainage material, and fresh compost substi-

tuted, taking care not to disturb the roots more than is necessary. Large specimens which have lost a number of leaves may be divided, and, the dead portions having been cut away, they may either be potted in small pots for increase of stock, or made up into specimens again. *Masdevallias* of the stronger growing kinds, such as *M. Veitchianum*, *M. ignea*, *M. Landoni*, *M. macrura*, *M. elephantopus*, *M. Mooreana*, and the *M. Harryana* type, require ample roofing space. They are best grown in pots or moderately deep pans. Others, such as *M. Conraultiana*, *M. Cheloni*, and *M. Stella*, should not be allowed so much space. All the above-mentioned species may be grown on the stages. The dwarf-growing kinds, such as *M. Arminii*, *M. muscosa*, *M. Estradae*, and *M. O'Brieniana*, should be placed in shallow pans and suspended from the roof-rafters. *M. platyglossa*, *M. leontoglossa*, and members of the *Chimera* section, which develop their inflorescences downwards, should be grown in teak-wood baskets. Any repotting of the last-mentioned section is best done during February. A suitable compost is equal proportions of *Osmunda-fibre* and *A1 fibre* cut rather short, and half-decayed Oak leaves (the latter rubbed through a half-inch sieve), with chopped Sphagnum-moss and crushed crocks added. The whole should be well mixed together. In potting, keep the base of the plant a little below the rim of the receptacle. Press the compost moderately firmly, but not so hard as to prevent the water from passing through freely, and finish with a layer of chopped Sphagnum-moss over the surface. Do not afford much water until the roots are seen pushing their way into the new compost. Shade the plants for a time from all sunshine, and maintain a moist atmosphere. If a special house is not available, choose the warmest and shadiest part of the *Olanthoglossum* house. *Masdevallias* require plenty of fresh air, but cold draughts are harmful.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTHCOLE, Eastwell Park, Kent.

NERINES.—Nerines have been resting in full sun for some months, in a cold frame, and are now throwing up an abundance of flower spikes. The flowers will last longest if the plants are staged in a well ventilated greenhouse. Arrange them with a groundwork of dwarf ferns, to compensate for the absence of foliage; or stage a few light foliage plants with them. *N. Fothergillii* major is still one of the most popular varieties.

GLORIOSA SUPERBA.—As plants of *Gloriosa superba* come out of hibernation, remove the plants from the wires of the flowering house, and train the shoots around Bamboo canes for the remainder of the season. Place them in full sun in a light and airy house in order to ripen them completely. The water supply should be reduced as soon as the leaves show signs of turning yellow, decreasing by degrees till the stems are completely dried up, when it should be entirely withheld. After this the bulbs should be kept perfectly dry and fairly warm during the winter, not allowing the temperature to remain long below 55°.

PLANTS FOR WINTER FLOWERING.—In a general way, soft-wooded plants should not be given stimulants much after this time of the year. Stimulants should be used with great caution as the days get shorter, as it is very easy to defeat the object with which they are usually administered, viz., winter-blooming. Plants that are over-fed in their growing days often fail to give satisfactory results at blooming time. I refer principally to such soft-growing plants as winter flowering Begonias, Zonal Pelargoniums, Cinerarias, Primulas and Calceolarias.

CLEANING PLANT HOUSES.—This time of the year is often the most convenient for cleansing and painting greenhouses, as many plants may now be safely stood out-of-doors for a time. But as painting is practically an impossibility at the present time, an extra good washing should be given. Scrub all wood-work and glass, and lime-wash all brick walls. See that the gravel or spar on the stages is thoroughly washed. Leave the house open for a few days to sweeten, and then thoroughly hose down before arranging fresh plants on the stages.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVERT, Abbots Wood, Godalming, Surrey.

RASPBERRY.—The old fruiting canes of Raspberries should be cut close to the ground. The shoots of the current season will thus receive more light and air to ripen them thoroughly. Raspberries require a change of soil occasionally, and it is a mistake to allow the beds to remain continuously on the same ground. If the raking of a new bed is contemplated a portion only of the old plants should be destroyed, and the replanting spread over several years, so that there may be no shortage of the crop. The ground selected should be well trenched and enriched with materials from an old hot-bed and old soil from the potting shed. These materials are better than fresh manure used at the time of planting. Choose varieties that are known to do well and thrive in the particular district in which the garden is situated. Norwich Wonder, Hornet, Baumforth's Seedling, Superbette, and, for autumn use, Belle de Fontenay, offer a good selection. Supports must be provided. Iron stakes with a strut at either end and wires stretched across are the most durable.

STRAWBERRIES.—Cut away all runners, also decaying or injured foliage from Strawberry plants. Tidy up the beds and see that they are free from weeds, especially those that seed freely. See that the soil around the plants is quite firm, as loose plants will never do well. Males have been a great nuisance here of late, and are often troublesome in Strawberry beds. The animals should be trapped in the usual way. Finish planting if the work is not already completed, and see that all vacant spaces in the rows are made good.

TREES ON WALLS.—Make secure any long branches on wall trees that are loose, or the winds may damage them. Harvest all the fruit on sunny days, and store the surplus in the fruit room. Make an examination to see if any trees are cankered and need replacing with healthy specimens. Send the order for the trees to the nurseryman in good time, and thus get the pick of his stock.

FRUITS UNDER GLASS.

By JAS. HENSON, Head Gardener at Gungahbury House, Aton, W.

PLANTING PEACHES AND NECTARINES.—Early October is the best time to plant Peaches and Nectarines indoors, and where such work is intended to be done this season, preparations should be made now. It is unprofitable to train trees that have become worn out. If fresh trees have to be purchased, place the order with the nurseryman at once, for as the season advances the best trees are sold. I prefer to plant specimens at least four years old, that have been well trained. Some growers prefer trees that possess a central growth; others those with the centre open. My choice is the latter type. For where gross growth develops in the centre of the tree it can more easily be dealt with. Having selected the trees on the spot, note well their present condition. If growth be still active the nurseryman should be requested to have the roots shortened somewhat as a check to the tree's activities. Half standards will be found suitable for planting in the front of the house, whilst for the back wall standard trees with a 4-foot stem are most useful. Select trees with clean, straight stems, and see that the part where stock and scion unite is well balanced.

VARIETIES TO PLANT.—Houses with at least two divisions (three are preferable if a constant succession is desirable) are best for the first early varieties. Duke of York or Duchess of Cornwall may be selected as first early Peaches, with Peregrine for succession, whilst Early Rivers and Lord Napier are suitable varieties of Nectarines. If the house will accommodate six trees, add Early York as an additional Peach and Bryden as a Nectarine. I would plant Peregrine and Early Rivers' Peaches, in the second early house, with Dr. Hogg and Dymond, and Hardywick Seedling and Pine Apple Nectarines. I have not included Cardinal Nectarine simply because the fruits are predisposed to crack on trees planted out, but for pot culture it is the very best early variety that can be grown. For a

later house my choice would be Thomas Rivers, Late Devonian, and Alexandra Peaches, and Pine Apple, Newton, and Victoria Nectarines. Meanwhile, lose no time in preparing the border for the reception of the trees. In some cases it will not be advisable to concrete the bottom of the border, but it is necessary in most soils. It is not essential to employ cement; ground lime will answer equally well for mixing with the ballast. Make the drainage with an easy slope. Not more than half the soil should be placed in the border at first. Let the house be overhauled and any necessary repairs done. It will be well to point the woodwork throughout, and the occasion offers a good opportunity to execute repairs to the hot-water system.

THE FLOWER GARDEN.

By W. J. GUTS, Gardener to Mrs. DEMPSTER, Keele Hall, Staff-ordshire.

SUB-TROPICAL PLANTS.—All-growing plants should be neatly secured to strong stakes before they are damaged by wind. Canna, Kichinos, Canabis, Wigandia, and similar plants require liquid manure with occasional doses of soot-water to give colour to the foliage. If the beds are furnished with dwarf plants, give a light dusting of concentrated fertiliser between the plants. After the soil has been stirred with a hand fork, give the beds a thorough soaking of clear water through a coarse sieve.

PROPAGATING BEDDING PLANTS.—In most gardens there will not be sufficient labour to propagate large numbers of bedding plants, but some attempt should be made to get on a proportion of one variety. Cuttings of Cosmos, Impatiens, and Alternanthera must have the assistance of a little bottom heat. Marguerites, Calceolarias, Verbena, Saxifrage, Tropaeolum, Heliotrope, Lantana, Pentstemon, Gypsophila, Mesembryanthemum, Andros, and Pansies may be rooted in boxes or shallow frames. Insert the cuttings freely, 4 inches apart, in well drained, sandy soil. Directly the frames are filled, water the soil through a fine rose and spray the cuttings in the afternoon during bright weather. Air should be given for an hour or so in the mornings to prevent damping, and the frames lightly shaded from direct sunshine. It is a good plan to place a number of old plants in pots or boxes for stock. These plants will provide cuttings for propagating in the spring, and usually give better results than autumn struck plants. Mats should be in readiness to throw over the lights in frosty weather. After the cuttings are taken, make the beds neat and clean by removing all dead flowers, foliage and weeds. It will be necessary to stir the soil with the flat hoe after the recent heavy rains.

LILIUM. Bolls of Liliun candidum, if in a healthy condition, should not be disturbed. If, however, they show signs of exhaustion, lift them at once and replant the largest in fresh loamy soil 4 inches deep. The best effect is obtained by planting in groups in the herbaceous or mixed borders. Those grown in pots for decorative purposes should now be planted in the borders or reserve beds. Bolls purchased from the nursery quickly deteriorate if they are not planted directly they are received.

PROPAGATING VIOLAS AND PANSIES. In cold, wet districts cuttings of Violas and Pansies need the protection of a frame. Select sturdy shoots from the base of the plants, and insert the cuttings 4 inches apart in sandy soil. Water through a fine rose to settle the soil, and spray the cuttings occasionally during dry weather. Shading from bright sunshine is necessary, but the lights must not be placed in position for several weeks, except in wet weather.

FUCHSIA.—To obtain standard flowering Fuchsias for bedding purposes next year, insert strong cuttings in small pots filled with a sandy compost. The cuttings will quickly form roots if afforded a little bottom heat. Directly they are rooted, pot singly into 3-inch pots and place on shelves near the roof glass. Syringe the plants daily and maintain a temperature from 55° to 60°. Shift into larger pots as the plants require it, using a compost of loam, manure, leaf-mould, sand, and a little wood ash. The plants must be kept growing steadily through the winter.

THE APIARY.

By CALROSA.

FOUL BROOD.—I have received requests from beekeepers for help with regard to this disease in districts where it has hitherto been unknown. The complaint has been known for many years, but it was not until the seventies that the true cause was found—a bacillus—named, in the twenties, Bacillus alvei. As the disease attacks brood generally it is commonly known as "Foul Brood," though it has been alleged that queens and mature bees may suffer from it, too, and for this reason it is also known as "Bee Pest." The disease takes two forms—the serious cases it is known by its strong smell, while in its less serious state it is odourless, the former being difficult, and the latter easy to cure. It is generally first detected on brood. Healthy brood is compact, plump, and pearly white, and in its earliest stages the larva is curled up in the bottom of the cell. As soon as disease attacks a hive the plumpness of the brood disappears and a lengthy and flabby appearance is assumed, with a straightened instead of curled form. The pearly whiteness disappears, giving place to straw-yellow, followed by a deep brown. Then the dead brood begins to decay, eventually drying up and leaving a withered scale adhering to the side of the cell. Healthy cells are covered by perfect raised cappings, but when foul brood sets in the cappings are darker, indented and irregularly perforated. If a match be inserted in the discoloured, perforated, capped cell and then slowly withdrawn, aropy, coffee-coloured, evil-smelling mass will be seen sticking to it in a fine thread when drawn from the cell. This is the trachea, which will not decompose. Very soon the bees become lazy, and seem to lose interest; many are seen fanning at the entrance to get rid of the bad odour, which, in severe cases, can be observed without removing the roof of the hive. Since the queen lays eggs in the cells where the brood dies of the disease, and workers deposit honey and pollen in the same cells, both honey and pollen may be the means of spreading the disease by the nurse bees when feeding larvae. The beekeeper may also spread the contagion by handling healthy bees without properly disinfecting his hands and clothing.

CURE FOR FOUL BROOD.—If measures to combat the disease are taken in the early stage the colony and the whole apiary may be saved. In slight attacks remove the bees from the combs, place them in an empty straw skep, and feed them on syrup, as described below. Burn the combs, quilts, and frames and thoroughly disinfect the hive by scrubbing with boiling water and soap. Afterwards paint every portion of the woodwork with a solution of one part Calvert's No. 5 carbolic acid in two parts water. Place the hive in the sunshine, and when the odour has disappeared it will again be ready for use. After a period of forty-eight hours the bees should be shaken into a clean hive fitted with frames of full sheets of foundation and carefully wired; five or six frames will be sufficient. Feed with medicated syrup for a few days. To prevent the disease from spreading perform the whole operation in the evening. If the colony be headed by a young, prolific queen it should be well. To ensure further success place two split naphthalene balls on the floor board, and renew them occasionally, as the heat of the hive causes the naphthalene to evaporate. After the beekeeper has manipulated a diseased colony all appliances used should be sprayed with a solution of Calvert's No. 5 carbolic acid, using 1 oz. in 12 oz. of water.

FEEDING. Feed with syrup made in the proportion of 10 of sugar to 7 parts of water. Boil for a few minutes, but do not allow the syrup to burn, and add $\frac{1}{4}$ to 1 teaspoonful of soluble phenyle to each quart, pouring the syrup in the phenyle and shaking well to form an emulsion. Increase the amount of phenyle from $\frac{1}{4}$ to 1 teaspoonful gradually as the bees show increased disposition to take it. Phenyle is non-corrosive and non-poisonous, and forms an excellent substitute for carbolic acid for general purposes of disinfection.

EDITORIAL NOTICE.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY.—Royal Hort. Soc. meeting, in conjunction with the National Dohlla Soc. Floral meeting and National Rose Soc.'s Display of Roses.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 58.2.

ACTUAL TEMPERATURE.—*Gardeners' Chronicle* Office, 41, Wellington Street, Southampton, on 7th September. Time, September 6, 10 a.m. Bar 29.7; temp. 62.6; Weather—Dull.

SALES FOR THE ENSUING WEEK.

TUESDAY.—Winter-flowering Heaths, &c., at Burnt Ash Road Nursery, Lee, by order of Messrs. B. Maller & Sons, at 11 o'clock, by Protheroe & Morris.

WEDNESDAY.—Ferns, Palms, &c., Vans, Piping, &c., at Gensia Road, Upper Edmonton, by order of Messrs. H. B. May & Sons, Ltd., at 11.30 o'clock, by Protheroe & Morris. Home-grown Bulbs, at 67, Cheapside, at 1 o'clock, by Protheroe & Morris.

The Samoan and Tonga Islands.

From the daily papers we learn that these groups of Pacific islands have again been visited by earthquake and hurricane; but no particulars have come to our knowledge. Still, in the light of events since war was declared, it may be useful to give some information, and some particulars of the sources of information, on the vegetation of the islands and cultivation in the islands. Both groups lie within the southern tropics, in extreme western longitudes, in the region of Fiji. Many readers will remember the great disaster of 1889 to shipping in Samoa from a tidal wave, when H.M.S. "Calliope" escaped by steaming out to sea. Taking the Samoan group (the Navigators' Islands) first, Savaii and Upolu were assigned to Germany by agreement in 1900, and the rest of the group to America. Planting by Americans and Europeans had long been practised, and the Germans have rapidly developed the industry since that date. Already in 1904 Dr. F. Wohltmann published an elaborate illustrated report in the *Tropenpflanzer*, entitled "Pflanzung und Siedlung auf Samoa." This report is very thorough, both scientifically and practically, and embraces meteorology, analyses of soils, cultivation, labour, outlay, foundation of experimental gardens, export, and kindred subjects. Previous to the German occupation a London mission had established itself in the islands, and Mr. Hills, the principal, had founded a "Botanic Garden." Dr. Wohltmann devotes some half-a-dozen pages to the description, illustration, and laudation of this garden, concerning which he cannot speak too highly. It was a part of the mission's scheme for educating and employing the natives, and it contained at that date specimens of about 150 useful

kinds of plants of various ages and stages of development. One of the views represents a group of thriving young trees of Hevea. Kew Herbarium possesses very considerable collections of dried material from the Samoan Islands, largely made, about the middle of the last century, by the missionaries Powell and Whitmore. Dr. W. Botting Hemsley commenced compiling an enumeration of the Flowering Plants and Ferns of Samoa about 1894. In 1896 Dr. F. Reinecke published the first part of his *Flora der Samoa-Inseln*, and this contains the Cryptogams—Algae to Filices. This was followed, in 1898, by the *Flowering Plants*, containing descriptions of many previously unknown plants, with half-a-dozen plates of novelties. A rough comparison of the two lists shows that the Kew list contains from 20 to 25 per cent. additional names, including some of importance; but a critical concordance would most likely give a relatively lower result in species. Two references to contributions to the Flora of the Tonga or Friendly Islands (since 1898 under British protection), have appeared in the *Journal of the Linnean Society*, XXX. (1891), pp. 157-217, plates 9-11, by Dr. Hemsley, and XXXV. (1901), pp. 19-65, by J. H. Barkill. Supplementary to the foregoing is J. J. Lister's "Geology of the Tonga Islands" in the *Quarterly Journal of the Geological Society*, XLVII. (1891), pp. 589-617, plate 23.

TRIAL OF PERPETUAL-FLOWERING CARNATIONS.—A trial of Perpetual-flowering Carnations will be conducted at Wisley during the forthcoming season. Growers are asked to send three plants of each variety for trial, to reach the Director not later than the 50th inst.

ACREAGE OF HOPS.—The preliminary statement of the Board of Agriculture with regard to the acreage under Hops in June, 1917, in those counties where Hops are grown, shows that, as usual, the acreage in Kent far exceeds that in any other county, and indeed comprises five-eighths of the total area. There is, however, a marked decrease in the amount of Hops grown in 1917 compared with that of the two preceding years. In 1915 the total area under Hops in Kent was 21,555 acres, and in the whole of England, 34,744. In 1917, this figure had dropped to 10,465 in Kent, and an aggregate of only 16,946 acres altogether.

BI-CENTENARY OF MESSRS. AUSTIN & McASLAN.—In commemoration of the 200th anniversary of the founding of the firm of Messrs. Austin and McAslan, the well-known Glasgow nursery firm, a dinner has been arranged, which will take place in the Trades House, Glassford Street, Glasgow, on Friday, the 28th inst., at 6 p.m.

THE PANAMA HAT "PALM."—*Carludovica palmata*, which, according to Nicholson, is a native of Peru, has recently been introduced into the Philippines, and is now being cultivated there. This plant is the source from which the Panama hat is produced. It appears to be very amenable to cultivation, and is propagated readily by division, so that a large increase in the supply of Panama hats may be looked for in the near future. *Carludovica palmata*, though Palm-like in habit, is not a true Palm, but a member of the order Cyathales, not a few of the members of which are, or used to be, grown as stove plants in this country.

* "Current Notes," by E. J. Webster, in the *Philippine Agricultural Review*, X., 1, 1917.

MR. JAMES GIBSON.—We learn that Mr. James Gibson is taking over all the kitchen gardens and most of the glasshouses at Welbeck on the 27th inst., and conducting them on commercial lines for his own profit. During the fourteen years or so that Mr. Gibson has had charge of these gardens his relations with the Duke and Duchess of Portland have been of the most cordial nature. The changes now taking place have been brought about in Mr. Gibson's own interest, and he enters on his new enterprise with his employer's good wishes and material support.

DEGENERATION IN POTATOS.—The most recent contribution* to the important and vexed question of the running out or degeneration of Potatoes, though it does not throw much light upon the subject, serves to show how essential it is to keep this subject under investigation. In the present investigation the behaviour of tubers from apparently normal plants of several different varieties of Potatoes was followed during several generations. Certain evidence of degeneration was presented by the plants produced from some of these tubers. In other words, the degeneration appeared suddenly in the plants produced from apparently normal tubers. Some of the malformed plants were affected by curl, and produced dwarfish plants bearing few and small tubers. Others were afflicted with mosaic disease, that obscure malady of uncertain origin which destroys Potatoes, Tomatoes, and Tobacco plants. Yet other plants suffered from spindling sprout and leaf roll. Tubers from plants suffering from these diseases produced almost without exception malformed and degenerate plants. So far as they were concerned, the stock had "run out." A striking general confirmation of this rapid deterioration of a stock was to be seen this year at the Royal Horticultural Gardens, Wisley, where a stand of Midlothian Early contained not one normal plant. All were curled and dwarfed and manifestly degenerate. In order to ascertain whether the soil in which the Potatoes were being counted for anything in this astonishing result, the Midlothian Early Potatoes were lifted and tubers of Arran Chief planted in the ground. The Arran Chief Potatoes produced normal plants, whence it is to be inferred that soil conditions could not have been responsible for the failure of Midlothian Early, and that that failure is to be ascribed to something unknown which we call degeneration in the tubers themselves. In the face of facts such as those just recited, and the many others given in detail by Mr. F. C. SHAW, men of science must admit that there are problems of the first order of interest and importance on which they can at present throw no light whatever. It is easy, of course, to suggest that seed should only be planted if it has been derived from the good Potato districts, and it is also easy to advise growers never to put seed on the market from a field in which some plants affected by curl or roll or other of these diseases of degeneracy have already appeared. But it cannot be denied that the position of the problem of degeneration of Potatoes is very unsatisfactory, nor that it is much to be desired, both in the interests of the growers and also of science, that the problem should be submitted to a thorough investigation.

THE LATE PHILIPPE DE VILMORIN.—The *Journal of Heredity*, of America, publishes in its August issue an interesting review of the history of the well-known French seed house of Vilmorin, of which the head partner, Monsieur PHILIPPE DE VILMORIN, passed away at an early age a few weeks ago. It would appear that the business was founded as early as 1727, though not under the name of VILMORIN. It was a little Paris seed store, with the quaint name of "Au coin de la bonne foy," kept by PIERRE GEORGEY, whose daughter married a botanist named

* Observations on some Degenerate Strains of Potatoes, by F. C. Stewart, New York Agric. Exp. Station, Geneva, N.Y.

Pierre d'Andrieux. The daughter of this couple married, in 1774, **Philippe Vétoure-Leveque de Vilmorin**, and thus was founded the business known ever since as that of **Vilmorin, Andrieux et Cie**—one of the most celebrated in the world. The **de Vilmorins** have in every generation been identified with horticultural progress. **Louis de Vilmorin, 1816-60**, became famous by reason of his work in improving the Sugar Beet. Besides revolutionising the sugar industry, he contributed largely to the study of genetics; indeed, his research was almost the only work of practical importance in this direction which was done in France during the nineteenth century. He was succeeded by his son, **Henri**, who died in 1899, leaving his son, **Philippe**, to carry on the work. By the end of the last century the name of **de Vilmorin** had become famous throughout the world, and had attained a scientific and social prestige which it is difficult to over-estimate. Towards the latter part of his life, **Philippe** spent most of his time in genetic research, the active direction of the business being carried on by his brother-in-law, **Comte d'Elieusse**. Another member of the family, **Maurice de Vilmorin**, president of the *Académie d'Agriculture*, has one of the largest collections of trees and shrubs in Europe, and has published several monumental works on the subject. Perhaps one of the greatest services to genetics which **Philippe** was able to render was the organisation of the International Conference on Genetics, held in Paris in 1911. He threw himself into the immense labour involved by this Conference with the utmost enthusiasm, and generously bore a large proportion of the expense. "Science," truly remarks the writer of the article, "can ill afford the loss of a man like **Philippe de Vilmorin**."

WAR ITEMS.—We regret to learn that Second Lieut. **B. HANLEY**, Royal Scots, who before the war was employed by Messrs. **Down and Co.**, Edinburgh, and resided at **Restalrig Gardens**, where his father is a large market gardener, has been killed while leading his men into action. He was mobilised with the Lothians and Border Horse when they broke out, and served with that regiment at the Front. In June last, at the completion of his course in a cadet battalion, he received his commission in the Royal Scots, and returned to the Front last month. He was 25 years of age.

—We regret to learn that Second Lieutenant **MONTAGU H. CHYMAN**, the only son of Mr. **F. H. CHYMAN**, of Rye, was killed in action on August 14. The colonel of the regiment, the 10th Battalion of the Rifle Brigade, wrote of Lieutenant **CHYMAN**: "He was a very brave officer, and I cannot tell you how I feel his loss."

—We also regret to announce the death of Private **WILLIAM DEWAR**, second son of Mr. **A. Dewar**, gardener at Dalkeith. He was killed on August 6 by a shell, which demolished a dug-out and killed six out of seven who were present. The late Private **Dewar** served his apprenticeship at Dalkeith, and after further experience in the gardens at Castlehill, **Carberry Towers**, **Culzean Castle** and **Dundas Castle**, was appointed gardener at **Dunlossit Castle**, **Port Askaig, Islay**, where he had been for four years before joining the Argyll and Sutherland Highlanders.

LOCAL SOCIETIES.—The members of the Derbyshire Gardeners' Association held their tenth annual exhibition on August 11. There were 500 entries, contributed by about forty exhibitors. Besides the competitive exhibits, there were a number of trade groups.

—The seventh annual show of the Hull Garden Village Horticultural Society took place on August 10. The floral exhibits were somewhat below average, but the vegetable were better than usual. The first prize for the best all round garden was awarded to Mr. **W. STOKES**.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See also 'Tables in *Gardeners' Chronicle* for July 28.)

(Continued from p. 91.)

5. ENGLAND, N.W.

WESTMORELAND.—Espalier Apples in a sheltered situation are promising, especially **Lane's Prince Albert**, **Lord Grosvenor**, **Newton Wonder**, **Bismarck**, and **Worcester Pearmain**. **Victoria** and **Karl's** Plums on walls are good. **Père's Marie Louise**, **Glen Monaghan**, and **Doyenné**

severe weather. *Frank J. Clark, Tchody Park Gardens, Cambridge.*

DEVONSHIRE.—Outdoor Cherries are poor, owing to the soil being deficient in lime. Under glass, Cherries carried a heavy crop, and the quality was good. Gooseberries were poor, owing to pheasants stripping the buds in spring. Raspberries and Currants, both **Black and Red**, were heavily cropped, the berries being of first class quality. Some Plum trees carry a heavy crop, but the greater number have no fruits. The soil is deficient in lime, and is of a light nature. *G. H. Shochidyp, Biston Gardens, Bullleigh, Salterton.*

Apples in gardens are for the most part well set with fruit, but somewhat uneven. There

FIG. 50. FLORE OF **STEFANICA VAR. FLUENS**, **EDWARDS**, EARLY PINK. (See p. 90.)

in abundance of Pears on standard, pyramid and wall trees. The setting of Peaches and Nectarines was extraordinarily good, and the fruit is now swelling satisfactorily. The trees are particularly clean. *P. C. M. Vitch, Royal Nurseries, Exeter.*

5. ENGLAND, S.W.
GLoucestershire. Apples are very clean and healthy. All kinds of Nuts seem to be in abundance. Figs on walls are carrying more fruit than usual. *P. C. Walton, Studley Park Gardens, Stroud.*
Prospects for Apples and Pears in the county are good, both as regards table and vintage fruit. Caterpillars did considerable damage to Apple trees in some districts, being generally worse in plantations than in grass orchards. Plums are yielding a big crop, particularly local

GLoucestershire. Apples are very clean and healthy. All kinds of Nuts seem to be in abundance. Figs on walls are carrying more fruit than usual. *P. C. Walton, Studley Park Gardens, Stroud.*
Prospects for Apples and Pears in the county are good, both as regards table and vintage fruit. Caterpillars did considerable damage to Apple trees in some districts, being generally worse in plantations than in grass orchards. Plums are yielding a big crop, particularly local

varieties, such as Blaisdon Red and Pershore Strawberries and other small fruits were over quickly, but they sold well. *G. H. Hollingworth, Sharn Hall, Gloucester.*

Fruit crops in general are above the average. Apples and Pears set freely, and had to be thinned, especially the culinary varieties. Strawberries were an extra good crop. In most seasons the earlier flowers are damaged by frost, but it was not so this year. Givon's Late Proflic is by far the best late variety with me. Nuts are very late. The soil is of a heavy nature, subsoil clay; altitude 400 feet above sea level. *Arthur Chapman, Westnabul, Tetbury.*

— In my own orchard there is only a medium crop of fruit. Caterpillars have been prevalent, and certain trees seem to be attacked more than others. Apples Adams' Pearmain and Dutch Mignonne were nearly stripped. Pears are plentiful. Peaches outside are looking very well and bearing a good crop. *John Bouting, Tortworth Gardens, Fifehead.*

HEREFORDSHIRE.—We have an excellent fruit crop; the trees are clean and healthy, and the fruit should be abundant. Our outside Peaches and Nectarines required very severe thinning, and the foliage has been clean and free from blister. The soil is heavy loam on limestone. *G. Mullins, Eastnor Castle Gardens, Ledbury.*

— Fruit trees in general bloomed splendidly this season, but were attacked by insect pests, owing in a great measure to the trees not being sprayed through shortage of labour. The Apple blossom weevil and the Pear midge, in addition to the caterpillar of the winter moth, considerably reduced what would no doubt have been very heavy crops. Notwithstanding, we have good crops on many of the trees, which are very healthy. Apple trees bearing heavily are Adams' Pearmain, Allington Pippin, James Grieve, Scarlet Nonpareil, Mannington's Pearmain, Eremont Russet, Charles Ross, Rival, and Wealthy Young trees of Cox's Orange Pippin are bearing fair crops of healthy fruit, while the older trees carry only a small crop, and the fruit is inferior. Among culinary Apples the best are Warner's King, Seaton House, Lord Grosvenor, Lord Derby, Hambling's Seedling, Bramley's Seedling, Sandringham, Newton Wonder, Loddington, White Transparent, and Lane's Prince Albert. The best Pears are Emile d'Heest, Magrate, Bonny Hardy, Doxenné du Comice, Durondeau, Pittmaston Duchess, Joséphine de Malines, Nouvelle Fautie, Bourré Diel, Easter Bourré, Charles Ernest, Knight's Monarch, Louise Bonne de Jersey, Huyshe's Victoria, Triomphe de Vienne, and Margaret Marillat. Loganberries were killed down to the ground by the frost last winter. Nuts are the heaviest crop I have ever seen. *Thomas Spencer, Goodrich Court Gardens, Ross.*

Apples have been dropping very freely, probably owing to cold nights and dry weather. Black Currants and Raspberries were average crops, but Gooseberries and Loganberries, under. In my own garden Raspberries were very plentiful, also Red Currants. Black Currants are average; Apples and Pears look rather light; Plums were uneven; the Victoria variety bore very heavy crops. Psylla and caterpillars were in general very prevalent, but there was little aphid attack. *H. E. Darham, Hereford.*

MONMOUTHSHIRE.—Apples blossomed abundantly, but failed to set well, and the blossom weevil was troublesome. In the case of some varieties the crops were further thinned by dropping. Pears are only fair, though some varieties need thinning. The midge was prevalent. Peaches and Apricots carry excellent crops; the trees escaped frosts while in blossom, which is an unusual occurrence here. The soil is cold and heavy. *Thos. Comber, The Hendri Gardens, Monmouth.*

WORCESTERSHIRE.—On the whole, the fruit crops are satisfactory, but hardly justify appear-

ances when the trees were in bloom. Damsons and Damascenes vary in the three orchards here; in one the trees are loaded, and I have been obliged to prop them up; in another some trees have very few fruits on them. The Pershore or Egg Plum is below the average. Proflic is a huge crop, and Magnum Bonum is better than I have ever seen it here. Victorius are light in some places, Blenheim Pippin Apples are very fair, but on the whole Apples are small for the time of year. The soil varies considerably. In some places it consists of good loam, in others of brown, sandy soil, and in others of a stiff loam with marly subsoil at 2 feet. *Thos. Watkins, The Grange Gardens, Chelms.*

— Apples, although fully up to average, are somewhat disappointing, in view of the splendid bloom which opened, and there was no late frost. The bulk of the trees in this locality had taken a season's rest, and the blossom seemed healthy and vigorous. There was a sudden attack of winter moth and other insects in many places, but not enough to account for the partial failure to set. Peaches, Nectarines and Apricots on walls are all clean and good, and the trees have not been troubled with blistered foliage the whole season. Strawberries were indifferent, both in quantity and quality, chiefly owing to the plants being nearly defoliated by the protracted and severe northerly and easterly winds. The soil here is strong loam, resting on marl. *W. Crump, Madresfield Court Gardens, Malvern.*

— Strawberries gave an average crop, and of very good quality. Royal Sovereign is the only variety grown here. Apple and Pear trees flowered profusely, but many of the fruits dropped. Our soil is fairly heavy, resting on sandstone. *Ernest Arvey, Finstall Park Gardens, Bromsgrove.*

4.—MIDLAND COUNTIES

HEREFORDSHIRE.—The fruit crops are generally good in this locality. Apples did not set so freely as was anticipated, and a great many have fallen; nevertheless there is a good average crop, and the trees are clean. All small fruits were plentiful and good. Black Currants included. Strawberries were particularly good, especially Royal Sovereign, Givon's Late Proflic, and British Queen. The soil here is a stiff loam on London clay, and the elevation is 305 feet above sea level. *Edwin Beckett, Aldenham House Gardens, Elstree.*

— Fruit crops generally are good, with the exception of Strawberries, which, on our cold, heavy soil, suffered badly. No doubt the heavy rainfall during the last three months of 1916, followed by continuous snow from March 22 to April 10, and frosts to the end of the latter month, were largely responsible for the comparative failure of this crop. *Thomas Nutting, Childwickbury Gardens, St. Albans.*

WALES.

CARDIGANSHIRE.—All Apple trees flowered freely, but some varieties did not set well. The trees are making excellent growth, and are mostly free from insect pests. The following varieties are fruiting well: Apples; Beauty of Bath, Mr. Gladstone, Lane's Prince Albert, Norfolk Beauty, Cox's Orange Pippin, and Warner's King; Pears; Williams' Bon Chrétien, Doxenné du Comice, Somers du Congrès, and Clapp's Favorite, Plums; Rivers' Early Proflic, Czar, and Proud's Seedling. The Gooseberry caterpillar has been very troublesome, and some of the Plums have been infested with green fly. Our soil is very cold, overlying slaty rock. *W. Phillips, Derry Ormond, Cardiganshire.*

— The Apples and Pears here have yielded a good crop for the third year in succession. The varieties that were poor last year are now very good. Peasecod's Nonesuch, generally a light cropper here, has a heavier crop than last year. We had two very bad attacks of cater-

pillar, first on Gooseberries, and then on Red Currants. The soil here is a good brown loam on a gravel subsoil. *Thomas Hazeldine, Cross wood Park Gardens, Aberystwyth.*

CARNARVONSHIRE.—The fruit crops generally are a good average. Apples flowered profusely, but the crop was not what we anticipated. Caterpillars caused great damage. The heaviest crop of Apples this year with us is Cox's Orange Pippin. Strawberries were much earlier than usual and had a very short season, the heat causing them to ripen very quickly. Plums are not a good crop; although the trees flowered profusely, the blossom failed to set well. The soil is gravelly. *J. S. Higgins, Glynllivron Gardens, Llanwnda.*

DENBIGHSHIRE.—The fruit crops in this district are very good on the whole. Apples are cropping well, except those that fruited heavily last year. Plums are carrying good crops and Damsons are plentiful. Strawberries were good where the plants escaped the frost of last winter. In some instances they were injured past recovery. *J. A. Jones, Chirk Castle Gardens, Ruabon.*

— The long and severe winter kept back the fruit bloom until about three weeks later than usual, so that we had very little frost during the blooming period, which accounts for the heavy crops of most fruits. Strawberries, however, were so badly cut in the winter that they failed to bloom as freely as usual. *J. Martin, Bryn Elyon Gardens, Wrexham.*

GLAMORGANSHIRE.—The fruit crop here, and in the district, is excellent. Apple, Pear, Peach and Nectarine trees are loaded with very fine fruits. All the trees are looking well, and perfectly free from pest of any sort. *C. T. Warrington, Penllynor Gardens, Swansea.*

PEMBROKESHIRE.—The Apples suffered from an attack of caterpillars. There was an abundance of Black and Red Currants; we have a newly planted orchard of about 400 trees, and they almost broke down with the weight of fruit. *T. H. Roberts, Salsbeck Park Gardens, Haverfordwest.*

PAINSHIRE.—The fruit crops in this district promise to be a good average. No late frost occurred to any appreciable extent. The chief trouble has been a plague of caterpillars. Apples, Red Currants and Gooseberries suffering severely. Apples of some varieties are carrying very light crops, including Blenheim Pippin, Bramley's Seedling and King of the Pippins. Pears are a good and heavy crop, promising well. Nuts, like Apples, are variable, Hazels and Filberts being plentiful, whilst Walnuts are very scarce. The soil is a good medium loam, resting on old red sandstone. *J. McCormack, Moorhatch Gardens, Glasbury, Hereford.*

IRELAND.

CO. CAVAN.—The fruit crops here are good, except the Strawberries, which were had on account of the cold spring. *J. J. McCann, Arley Mount Nagant Gardens.*

Down.—There was a profusion of blossom, but there is only an average crop of most fruit—in no case is thinning needed. All small fruits carried crops of remarkable quality. *T. W. Bolas, Mount Stewart Gardens, Newtownards.*

FERMANAGH.—Apples in this district are looking well. There is a heavy crop of early Apples, such as Gladstone, Beauty of Bath, Worcester Pearmain, Early Victoria, and Grenadier. Bramley's Seedling is slightly under the average. Pears are a good average crop. Both Apples and Pears have kept very clear of insects and fungus, and earlier has not done much damage. Gooseberries were a poor crop, and the caterpillars attacked the bushes. Nearly all the fruiting canes of Loganberries were killed by the severe winter. The soil here is a rather light, peaty clay. *J. Moncrieff, Florence Court Gardens, Enniskillen.*

(To be continued.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

VERONICA LOBELIODES.—The shrubby *Veronica* referred to by W. T. on p. 92 is not a species nor a variety of *V. speciosa*. Except in the shape of the leaves and the shortness of the raceme of flowers it does not closely resemble that species. It is a hybrid between *V. elliptica* × *speciosa*, and was raised by Mr. J. A. Henry, of Edinburgh, who first sent specimens of it to Kew on April 26, 1892, and to Messrs. J. Veitch and Sons, Chelsea, about the same time. Since then the plant was introduced to Melbourne, Australia, and thence to New Zealand, in 1865. Mr. T. Kirk, a great authority on the shrubby *Veronicas*, said it had the fascias of a New Zealand species, but did not originate there. The raiser, Mr. Henry, gave the parentage as *V. densata* × *speciosa*, but *V. densata* from the Falkland Islands has been proved to be identical with the New Zealand *V. elliptica* J. F.

TEA PLANTS.—I was much interested in Dr. Hovey's article on the Tea plant (pp. 67, 32) and in Mr. J. R. Jackson's note on p. 92. When at Kew in 1864 I had charge of glasshouse No. 19, which then stood opposite the old museum, and of a lean-to house behind the museum. The former house contained many economic plants, including some Tea plants. The two plants mentioned by Mr. Jackson were trained on the wall by the Duchess of Cambridge's garden. The plants were labelled *Thea Boba* and *Thea viridis*. The latter was much lighter green than the other. In the border in front of the wall were also two bush trees of the same species. I remember them quite well, and my note-book, written in 1864, now before me, reminds me of many other interesting plants in the border. *John Gregory, Croydon.*

OXALIS CORYMBOSA.—This plant has recently appeared as a weed in gardens in Sussex and Surrey. It is rather ornamental, and likely to be cherished on its first appearance, but anyone who encroaches it will bitterly regret it. As one correspondent writes: "It is all over in garden in the herbaceous borders, in masses in the strawberry and Asparagus beds, among the Rose, Potato, and Cabbages; in fact, there is not a square yard where it is not flourishing, and I am getting downhearted, for I see no possible deliverance from it. We work and slave for hours digging it up and burning it, but it sometimes flourishes." This statement is confirmed from a very important garden in Surrey. The most serious feature in the plant is the numerous bulbils at the bases of the leaves which are easily detached, so that being does more harm than good. *Alfred O. Walker.*

GRAPES WITHOUT FIRE-HEAT.—I have this year grown Muscat of Alexandria, Madresfield Court, Lady Hutt and Lady Down's Grapes entirely without fire-heat. I began cutting bunches of Madresfield Court and Muscat at Alexandria on August 6. The temperature during the flowering period often dropped below 50°, but every advantage was taken of the sun's heat, and the houses were closed and the temperature raised to 100° on all possible occasions. The great range of temperature did not seem to harm the vines in the least, and they have remained free from mildew, thrips and red spider. The bunches weigh from 2 to 3 pounds each. The berries of Madresfield Court having started to crack, I have pierced the laterals to check the flow of sap to the bunches, and this has stopped the cracking to a large extent. *R. Hill, Kinloch Castle, Isle of Rhé, by Oban.*

FRUIT CROPS AT MOUNT FELIX, WALTON-ON-THAMES.—We have abundant crops of all kinds of fruit. The gardens contain about 220 Apple trees, in 90 varieties, and 215 are bearing full crops. Three of the others had heavy crops last year, whilst the rest were moved this spring. Both fruit and foliage is clean and healthy, and exceptionally fine. One of 50 Pear trees, which include 40 varieties, is 45 and bearing full crops. Plum trees are laden with fruit. I have two fine bush trees of Primate Plum bearing good crops for the first time. This variety is useful to follow Monarch. Strawberries were a good crop, and we had an abundance of Raspberries, Gooseberries, and Currants. *Wm. Stanbury.*

SOCIETIES.

ROYAL HORTICULTURAL

Trials at Wisley.

The following awards have been made by the Council of the Royal Horticultural Society after trial at Wisley:—

DELPHINIUMS.

Awards of Merit.—Col. Sir Wyndham Murray, Capt. Harry Smeetham, Moorheim, Rozenlust, Kingston Queen, Lady Georgina Legge, Lady Hamrick, Mrs. A. J. Watson, Miss Shirley, Professor Coleman, Belladonna, Grandiflorum, La maritime.

Highly Commended.—Aeroplane, Attraction, Dawn, Dr. Ledwidge, Edwin Beckett, Florence, Galicia, His Excellency, Amos Perry, Corry, Lady Ravensworth, Progression, Lord Curzon, Lovely, Luna, Marchetti, Ma Mie, Mrs. James Keilway, Mrs. T. G. Baker, Novelty, Rev. F. Escobedo, Robert Gray, Star of Devon, Consuela, Violet, Oasis, Hamlet, Lord Lansdowne, Nobilis, Perfection, Sergeant Betanger, Statuaria Belle, *Commended.*—Eize, Miss Britton, Queen Mary, Rt. Hon. A. E. Fellowes.

ESCHES HOLTZIAS

Award of Merit.—Crocæ compacta Mandarin, Mikado.

Highly Commended.—Chrome Queen, Golden West, Orange King.

STOCKS (OUTDOOR).

Award of Merit.—Old Rose, Queen Alexandra, *Highly Commended.*—Almond Blossom, Bama, Canary Yellow, Mammoth Crimson, Princess Alice, Princess Alice Improved, Rich Purple, Saucette de Nice.

ONIONS (AUTUMN SOWNS).

Award of Merit.—Autumn Triumph, Fox-bell, Mammoth Red Tripoli, White Leviathan, Yellow Roan.

Highly Commended.—Ailsa Craig, Covent Garden, Ariston's Excelsior, Giant Globe Rocca, Giant Lemon Rocca, Giant Rocca Tripoli, Red Rubin Tripoli, Tribois, White Italian Tripoli, White Spanish Selected.

Commended.—Ailsa Craig, Rissano Tripoli, Great Zittau, The Sutton Globe White Emperor, White Italian.

GRASS BUTTER SPRING SOWNS.

Award of Merit.—Bowling's Turnip-shaped Globe.

Highly Commended.—Crosby's Egyptian, Selected Globe.

Commended.—Gimson Globe.

LIVERPOOL HORTICULTURAL.

At a meeting on the 7th the next's exhibitions of Cuts and Foliage have been discontinued since 1914, and the Association organised a special food show on the 10th and 11th insts. The schedule comprised 50 classes and some 500 entries were forthcoming. The Society also offered prizes to groups of not fewer than 25 allotments within 12 miles of the Town Hall, and in these classes good crops were made to Victoria Park, Tranmere; Ivy Farm, Alford; and Horthall, Alblerton. Six bronze shilling single-allotments were awarded the 8th and 9th insts. of Merit.

In the Gardeners' Section for 9 varieties of vegetables, K. FRENCH, Esq., of Thornton Heath, and Mr. W. PERRY, of the 1st prize, whilst C. G. GIBBS, Mr. J. WILKINS, Bellinshaw were successful. Mr. PERRY also showed the best 50 dishes of hardy fruits, and the best dried and tinned table fruits. In the classes for Allotment Holdings the best collection of vegetables arranged by an allotment society on a space 12 feet by 7 feet was staged by IVY FARM, Alford, the produce being grown on ground first cultivated in 1917. In a class for vegetables grown on ground cultivated prior to 1917 BURNING PARK, Boleyn, was successful. There were 10 entries in the class for a table of vegetables 6 feet by 1 foot, and this proved the closest competition in the show. Mr. J. WILKINS was adjudged the winner, with excellent specimens; and Mr. J. BOWMAN, Alford.

MESSRS. STUBBS AND SOSS, Bournemouth, showed a most competitive collection of vegetables, and were awarded a Gold Medal. Messrs. MUMFORD, BRIDGES, LTD., Liverpool, were also awarded a Gold Medal. Silver Medals were awarded to

MESSRS. THOMAS DAVIES AND CO., Wavertree, for vegetables; MESSRS. W. ROWLANDS AND CO., Chiddwall Nurseries, for vegetables; MESSRS. KRIS, LTD., Liverpool, for vegetables and fruit; and MESSRS. KER AND SOSS, Crossington, for Tomatos and fruit.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 5.—*Committee present:* R. Ashworth, Esq. (in the chair), Messrs. D. A. Cowan, J. C. Cowan, J. Cypher, E. Evans, A. B. Hamdley, D. McLeod, J. McNab, W. Shackleton, H. Thorp, and H. Arthur (secretary).

AWARDS.

FIRST CLASS CERTIFICATES.

Dendrobium Dearii var. *superba*; *D. Sandera McLeanii* var.; both from Messrs. J. AND A. McBEAN.

AWARDS OF MERIT.

Laelia Cattleya Luanensis Rosa Rossendale (Cattleya × L. leucostachya Walton Grange var.), from R. ASHWORTH, Esq.

Odontoglossum Zulu, from J. J. BOLTON, Esq.

CULTURAL CERTIFICATE.

To Mr. E. ROGERS, for *Phalaenopsis Bimaculata*, some of the spikes having over 40 flowers and buds; to Messrs. J. AND A. McBEAN, for *Dendrobium Dearii*.

GENERAL EXHIBITS.

R. ASHWORTH, Esq., Newchurch (Gr. Mer. Havemport), was awarded a Large Silver Medal, and Messrs. CYPHER AND SOSS, Cheltenham, a Silver Medal, respectively, for groups.

CROPS AND STOCK ON THE HOME FARM.

LATE TURNIPS AND SWEETS.

Owing to the continued wet weather and absence of sun during the past month, there are many backward plots of Turnips and Sweets. The prevalence of Chalk in large quantities, and the difficulty of obtaining labour, has also retarded the growth of the plants. Choose a fine day, and sow 1 cwt. sulphate of ammonia over each acre, which will give a fillip to growth.

WINTER VETCHES.

Vetches sown in September constitute valuable food for sheep during June and July. This crop turns the hummer of a satisfactory crop of Turnips or Rape, and thus prepares the soil for a heavy crop of Oats or Barley the following year.

Any clean stubble, as Wheat, Oats, or Barley, will be a suitable site. Some farmers sow Vetches on stubble infested with Couch grass and other weeds, in the hope that the Vetches will smother the weeds the following year. It is, however, preferable to sow on clean stubble and deal with foul stubbles by summer following. Deeply plough the land, burying all weeds by the aid of the skim coulters. Choose dry weather for harrowing the surface after ploughing previous to sowing the seed, which may be drilled or sown broadcast at the rate of not more than 2 bushels per acre. Once harrowed after sowing is sufficient to bury the seed. Do not make the surface too fine; clods are useful for protecting the plants from wind during the winter; the exposure to frost, air and rain pulverises them, and in April the roller drawn over the plant makes the fine soil firm about the roots. *E. Molloy, Ex.*

HOME-GROWN FARM SEEDS.

Formerly many farmers used to grow the seeds required for their Turnip, Swede, or Mangold crops, and there is much to be said for this practice. When the stock roots are carefully selected and guarded against cross fertilisation, home-grown seed is frequently of better quality than the average commercial sample. Two methods are open to the world-be home seed grower. If only small quantities of seed are needed, they may be obtained by selecting roots at the time of lifting, storing in winter, and planting again in the following spring to grow on for seed. Where a commercial seed crop is required, special

sowings of seed are made during the summer, the seedlings at transplanted in early winter or spring and seed is obtained from plants of which the roots have never developed as bulbs.

The best specimens of Cabbage give the best seed; but often the plants will show no sign of running to seed. In this event they can be assisted by being cut with a knife across the crown. Again, to avoid cross-fertilisation when Swede and Turnip seeds are both to be grown, or more than one variety of either Turnip or Swede is being grown, the beds should be not less than 500 yards apart or cross-fertilisation may occur. If grown in a garden only one variety should be planted; and care should be taken that no stray plants of the Cabbage family are in blossom in the near neighbourhood. Varieties of Mangold also must be isolated, the seed plots being placed preferably in the corners of separate fields at as great a distance from one another as can be arranged.

The most serious danger of cross-fertilisation, especially to Swedes and Turnips, arises when a crop of Rape is in bloom in their neighbourhood. The seed crop of Turnips is ready for harvesting in July, as a rule; that of Swedes in July or early August; that of Cabbages in August, and of Mangold in September.

REPLY.

SUGAR BEET.—In reply to *H. M.*, p. 83. I do not think it is possible to get rid of the earthy taste in the roots of Sugar Beet; it is like that of boiled mangolds. I think it would be detrimental to the juan. If the Beet is boiled from five to seven hours, adding a little water during boiling, so as to cover the roots, the water strained off containing the sugar from the Beet could be used for bottling or stewing fruit without any more sugar. I boiled some Sugar Beet last March and used the syrup for steaming fruit in July with good result. *E. M.*

ANSWERS TO CORRESPONDENTS.

APPLES DISEASED: *Mrs. B.* The fruits are attacked by brown rot, as you suspect. The trees on which there are "mummified" fruits, such as those you sent us, should be thoroughly examined, and all such fruits gathered and destroyed, as they are a source of infection.

Next spring, have all diseased branches and spurs cut back to just behind the discoloration, and spray the trees just after the leaves open with diluted Bordeaux mixture.

APPLES DROPPING: *J. H. J.* and *H. R. B.* The Apples are infested with the Codlin Moth, the grub of which penetrates to the core. Gather and destroy all fallen fruits, and place bins soaked in insecticide round the trunks of the trees.

Next spring, spray with Paris green (half a pound to 120 gallons of water) or arsenate of lead directly the blossoms have dropped.

AVOCADA SEEDS NOT GERMINATING: *J. J. B.* The failure of your seeds of Avocado to germinate is most probably due to the flowers not having been fertilised. The trees are usually dioecious, that is, the male and female flowers are borne on different individuals. If you have no male specimen near your tree there would be but little likelihood of the seeds being fertile. The seeds fall from the tree when ripe, and may be sown at once, but they take a long time to germinate. The seeds retain their vitality for a year or more if kept in a dry, cool place. They should be sown singly in small 60-sized pots and placed in a greenhouse or cold frame. Plunge the pots in ashes so that the soil is kept always moist, and give only sufficient water to keep the soil on the moist side. The seed will germinate quickly in a close propagating pit. Seedlings raised in warmth should be gradually hardened as soon as they commence to grow. They require to be planted out at an early stage, or the roots will become a tangled mass. The dying of the branches is a common occurrence when the trees reach the stage you mention, and is usually due to lack of moisture in the soil.

BEZONIAS DISEASED: *W. J. J.* The Bezonia is apparently attacked by "rust," a condition usually attributed to the action of a

microscopic mite. Dip the plants in, or if too large, thoroughly spray them with Tobacco water.

CELERY DISEASED: *J. C. B.*, *J. T.*, and *Old Subscriber.* The plants are attacked by a fungus, *Septoria petroselinum*. Pull up all diseased plants, and remove diseased leaves from others only slightly attacked, and bury them deeply in the ground. The first signs of disease are small, scattered brown patches. Next season, look out carefully for these symptoms, and spray with weak Bordeaux mixture. You can try the same method this season, but it is probably too late to do much good.

CHRISTMAS SALAD: *E. B.* This salad, which is much the same as Chervil, is best left in the ground and taken up to force as required. Thus treated, the plants start into growth freely, and the salad is of good quality. The plants may be forced in a dark cellar or Mushroom house.

CONIFER DYING: *W. J. H.* The Conifer is *Larix leptolepis* (the Japanese Larch). There is no trace of disease on the specimen sent; the generally stunted appearance of the shoots and leaves point to defective root action, probably the result of drought at the roots.

CUCUMBERS AND MARROWS DISEASED: *Miss P.* The plants are attacked by the disease commonly known as "powdery mildew," or *Erysiphe Cichoracearum*. Pull off and destroy all badly affected leaves, and dust the rest of the foliage as soon as the mildew seems to be appearing with flowers of sulphur. By this means the trouble will shortly be overcome.

CUCUMBERS DYING: There is no fungus on the specimens sent; the trouble may be due to wrong cultural conditions. Have you examined the soil to see if itworm is present?

CUCUMBERS WILTING: *Bols.* There is no disease present on the leaves to cause the plants to wilt; the trouble is probably lower down the stem.

CYPRIPRESS FENESTRIS: *C. T.* The two forms of growth you send are common in the true Cypress, and also in the Junipers. The feathery type with acicular leaves represents the juvenile stage as a rule, and the flattened growth the older form. In some cases the two types of growth represent sexual forms. Your plant is interesting in showing the changes from one form to the other and back again, but it is not uncommon amongst pot-grown Cyresses and Junipers.

GRAPES SPOTTED: *I. C.* We are unable, even after the most careful examination, to find any trace of disease on the berries. The spotting might be the result of scorching by too bright sunshine, or of defective ventilation. If you have been obliged to employ less skilled labour than usual on thinning, the injury might have been done then by carelessness in handling the bunches. In any case, the injury is exterior, and not inherent in the vine.

LEAVES: *J. T.*, *J. E. P.*, and *H. D. G.* The specimens arrived too dried up for it to be possible to determine what was the matter with them.

NAMES OF FRUITS: *E. T.* Bryanston Gage, *M. L. N.* Clapp's Favourite, *B. J. C.* Prime Damson—*J. H.* Beckhamsted, Apple Peach, Plum Black Diamond, *Shipkin*, 1, Golden Noble; 2, Potts' Seedling; 3, Hawthorned; 4, Charles Ross; 5, Josephine de Malines; 6, Magaret; 7, Fox decayed to identify; *M. D. B.* Early Harvest, *H. M. S.*, *Miss Apples*; 2, Emperor Alexander; 7, Cox's Orange Pippin; H. Waltham Abbey Seedling; 12, Hambleton Down; Aves; 15, Allen's Everlasting; 14, Brownlee's Trust; 15, Bramley's Seedling; 16, Egremont Russet; 18, New Hawthorned; 42, Cox's Orange Pippin; 45 and 46, Lane's Prince Albert; 47, Adam's Pearmain; 99, Peasegood's Nonesuch; Pears; 3, Pear decayed; 9, Comte de Lamy; 51, Vicar of Winkfield.

NAMES OF PLANTS: *James Bancs.* *Ulmus montana* (Wych Elm); *J. P. Holme.* 1, *Phila delphus micropyllus*; 2, *Potentilla fruticosa*.—*Rosslyn.* *Picea Spruceana*.—*J. C. B.* 1, *Senecio eucrafolius*; 2, *Chrysanthe-*

num Balsamita of Linnaeus (Cotnamy, syn. *Balsamita vulgaris*, of Willdenow); 5, *Artemisia ludoviciana* var. *gnaphalodes*.—*H. N. G.* *Lonicera japonica* var. *italiana*. *L. flexuosa* is another variety of *L. japonica*.—*Robert Rutoul.* *Ceanothus Avicchinensis*.—*C. C. P.* *Erythrina crista-galli*. *Cockscomb* or *Coral tree*. The plant may be propagated from cuttings. The small, green plant is *Helxine Sclerolii*.—*E. B.* *Hippeastrum ulicum*, more generally known in gardens as *Amaryllis tubca*. After the bulbs have flowered and matured their growth, place them on a shelf in a cool house or heated frame, safe from frost, and withhold water, or give only a little water at long intervals until growth commences again next season. We will give name of Apple next week.

NAMPHIENS: *W. J. H.* The Water Lily leaves have been attacked by water beetles, which have been very prevalent this year. There is no remedy beyond hand-picking, which is a tedious and difficult operation with water plants.

PEACHES AND NECTARINES: *Constant Reader.* The following six varieties of Peaches and Nectarines respectively are good and reliable sorts.—1, If only three of each kind are required the first three should be selected in each case. *Peaches:* *Peregrine*, *Bellegarde*, *Princess of Wales*, *Dymond*, *Royal George*, *Goshawk*. *Nectarines:* *Early Rivers*, *Lord Napier*, *Pine Apple*, *Dryden*, *Humboldt*, *Stanwick* *Elruge*.

PEACHES SPOTTED: *J. T. S.* We have made a thorough examination of the specimens, but can find no trace of any disease or insect pest. The spottings may be caused by some spray material you have used, or the fruits may have been scalded by sunshine on a particularly sunny day. Another possible alternative is that the fruits have been slightly bruised.

PEAR TREE INFESTED: *Constant Reader.* The tree is infested by the Mussel Scale insect, *Mycilaspis pomorum*. Brush the infested parts of the bark with a stiff brush, and afterwards spray with insecticide. Gather all fallen leaves and prunings and burn them.

PHLOX: *Blodow.* A disease known as "stem canker" is a common complaint among seedling Phloxes, and this is probably responsible for the failure of your plants. No cure is known for plants which are attacked, but you can prevent the spread of the disease by removing and burning all diseased specimens, and planting fresh seedlings in soil which is known to be free from disease germs.

PLUMS DISEASED: *L.* The Plums are attacked by Brown Rot; see also reply to *Mrs. B.* (under "Apples"), and p. 94 last issue.

SCABBY POTATOS: *H. S.* When next planting Potatos, immerse the sets for two hours in a solution of one pint of 40 per cent. Formaldehyde in 36 gallons of water. Add acid manures to the soil before planting the tubers, and be sparing of organic manures. Sprinkle flowers of sulphur over the sets immediately after planting. You cannot do anything in the way of remedial measures this season, but the scabby condition of the Potatos will not detract from their flavour or wholeness.

STEPHANOTIS FRUITING: *P. S.* It is not uncommon for the Stephanotis occasionally to produce a fruit, and such an instance was recorded in our pages for Dec. 26, 1895, p. 817. It is not of any value commercially.

TOMATO HOUSE: *M. L.* A suitable width for a lean-to Tomato house against an 8-foot wall would be 9 feet, with a 4-foot-high front wall, but you must be guided by the strength of the wall, and before deciding it would be wise to obtain the opinion of an experienced builder.

WEEDS IN PONDS: *S. F.* Any time is equally good for destroying the weeds in ponds, the sooner the better. The copper sulphate can usually be obtained from horticultural sundriesmen.

MARKETS.

COVENT GARDEN, September.

Plants In Pots, &c.: Average Wholesale Prices.

Table listing plants in pots and their prices, including Aralia Sieboldii, Asparagus plumosus, and various ferns.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers and their prices, including Asters, Carnations, Chrysanthemums, and various roses.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage and their prices, including Adiantum, Asparagus plumosus, and Moss.

REMARKS: There is a brisk demand for Chrysanthemums of all shades. Supplies are not so large as last year, and there are not sufficient best quality blooms to supply the demand. Large quantities of blooms are more numerous, but good quality and pink blooms are yet to arrive. Roses are getting scarce, the best blooms very few in sale are mostly 'Sunderland', 'Etoile de Hollande', and 'Etoile de Hollande'. There is a brisk demand for cut foliage, and prices for best blooms are generally higher. The market for cut foliage is getting scarce, and prices are higher. The market for cut foliage is getting scarce, and prices are higher.

Vegetables: Average Wholesale Prices.

Table listing vegetables and their prices, including Artichokes, Beans, Beetroot, Brussels Sprouts, Cabbage, Carrots, Cauliflowers, Cucumbers, Garlic, Greens, Herbs, Horseradish, and Leeks.

Fruit: Average Wholesale Prices.

Table listing fruit and their prices, including Almonds, Apples, Apricots, Cooking Apples, Currants, Damsons, Dates, Figs, Grapes, Guavas, Lemons, Melons, Nectarines, Nuts, Peaches, Pears, Plums, and Tomatoes.

NOTICE TO HEAD GARDENERS.

Revision forms for the "Gardeners' Chronicle" HORTICULTURAL DIRECTORY have been posted to Head Gardeners in every county in England, Wales, Scotland, and Ireland. In order to facilitate the early publication of the revised edition for 1918, gardeners are asked to return the forms with the necessary corrections **AS SOON AS POSSIBLE**. It is only by the co-operation of all gardeners that the 1918 edition of this invaluable work of reference can be made perfect.

ANY HEAD GARDENER who has **FAILED TO RECEIVE A FORM**, should send for a form to

**THE EDITOR, Horticultural Directory,
41, Wellington St., Strand, London, W.C. 2.**

FLORA OF THE CHINESE-TIBET BORDERLAND.

MR. GEORGE FORREST, who is again engaged in a plant-collecting expedition in the Far East, sends the following interesting communication to Dr. Keble, Director of the Royal Horticultural Society's Gardens, Wick:

"Tahfé, Yunnan,
"Via Bhamo, Upper Burma
"May 2, 1917.

AFTER a somewhat uninteresting and uninteresting journey, I am at last in Ta-hé, busy preparing for to-day's northward trip. For the first two days out from Lanchow, the weather was very heavy rain and very bad going, ten or twelve days of excessive heat for the time of year, ending in heavy rain the day I got in here. As a result, there has been another heavy fall of snow above 11,000 feet, and I hear the passes to be crossed between here and Anzette, the Lichiang and Boma Shan, are still closed, so there is no particular call for haste. However, I hope to leave here on or about the 10th, as I expect to be able to reach by the Sung Kwei Pass on my way to Lichiang. That portion of the Lanchow-Hachang district is particularly rich, and, though I have traversed it several times, I hope to get some more spoil.

"This, the central portion of the province, is still in a very disturbed state. For the past month the route eastwards to Yunnan has been practically closed to all traffic, owing to the presence of robber bands, disbanded soldiery who are plundering and murdering over a large area. Northwards, somewhat similar conditions obtain, the country being more or less held by the remnant of White Wolf's gang driven southwards. However, I guess I'll scrape through, if by my usual back holds. The Governor of the Province vacates office very shortly, and it is said he has interest in one thing only—the amassing of dollars before he retires. And so it goes on! Yet what a country it might be a good government!"

"So far from the frontier, as I have managed to secure specimens of some 170 species new to my previous collections. Most are trees and shrubs of much interest botanically, though of small value horticulturally. When considering

this, pray bear in mind that I have passed over the route twelve times! Two or three of the finer things were collected on the Shweh-Salwin divide, though I only hunted casually by the wayside, as that portion of the range comes within the scope of the three men whom I dropped at Tu-guch.

"I secured a few seeds of *Dichotomanthes tristaniaecarpa*, a monotypic genus of Rosaceae, only known and local in Yunnan. Unfortunately, the seeds, presumably very some of last season's, fallen, and, though I have little hope of their germinating, I send them to you. I have arranged for a quantity of seed to be collected in the autumn. Professor Balfour holds specimens of the species. The plant is a graceful shrub of 10-20 feet, with light-coloured, silvery foliage, practically evergreen in its habitat, with the general appearance of a Cotoneaster, but much more compact in habit. The flowers are rather uninteresting, but it is good in fruit. Fruits of two species of *Cherry* were also collected on the Salwin Valley, at about 15,000 feet, and the other here, altitude 6,500 feet. Both good and very fine fruiting specimens in collection. I shall forward seeds of both with the above, under separate cover; also seed of a good *Tsuga* or *Pseudotsuga*, collected at 7,000 feet. Quite a good *Caryota* at 5,700 feet.

"The small *Rhododendrons* were met with *R. ramosum* elliptic, Delavayi, and forms of *Fortunii*, so-called. I secured specimens of a form seen in small numbers which I take to be a hybrid between a white form of *Fortunii* and *Delavayi*. It bears the *Fortunii* foliage, though smaller, with large pink blooms, having the blotch of crimson at base seen in *Delavayi*. A shrub of 8-15 feet.

"In the Yangki Valley, two days west of Tai, the hillsides were ablaze with the blooms of *Rhododendron microphyllum* and *R. ciliolobum*. The first named, in my opinion, equals, if it does not even surpass, *R. ramosum* in wealth of bloom. It is said to be in cultivation, and that is probably correct; but in colour of flower it is, I think, it is very variable, and I question if the first forms have been secured. I marked several down, one almost pure white.

"Since our arrival here my men and I have been out once or twice on the range as high as the present snow-line, and have added a few peaches to the list.

"Amongst the first things sought for was *Rhododendron aurum*, and I was fortunate enough to secure a small quantity of last year's seed, which I trust will germinate.

"Portion of the gullies on the eastern flank of the range, a gully so far unexplored, I found three species, possibly four, of *Rhododendrons* new to me. As yet they are not numbered, but I wish to secure a larger number of specimens before including them in the collection. All are excellent subjects for horticultural purposes, two of them specially floriferous, shrubs of 3-6 feet. In three the bloom are of various shades of rose with darker markings; one, the dwarfest of all, has ivory yellow blossoms, flushed faint rose on exterior. A form of *R. sulfurum* was also collected, but much larger foliage than the type.

"The above plants have very much to be set to the name on this range. It would be well worth spending a full year here, if I could arrange to do so. However, I'm for north this season, and I have arranged for four collectors to work the western flank of the range, as well as the head waters of the Red River, and the Gbi Shan, a small range of hills lying to the north-east of the Tai Loo. That region was the scene of much of Père Delavay's labours. I mapped it in 1914, and found it most productive. I intend leaving men behind at Lichiang to work the portions of the Lichiang Range still unexplored, as well as the mountains north and north-west of the Yangtze bend."

ORCHID NOTES AND CLEANINGS.

CATTLEYA DAMARAS

A FLOWER of a new hybrid *Cattleya* named *Damaras*, raised between C. Lord Rothschild (*Dowiana* x *Gaskelliana*) and C. *Artemis* (*Iris* x *Gaskelliana*), is sent by Mr. H. G. Alexander, Orchid grower to Lieut.-Col. Sir Geo. L. Hoford, Westonbirt, Tetbury. The sepals and petals are light rose colour on a silver white ground, the frilled labellum bright purple in front and at the margins of the side lobes, the centre and base orange colour, changing to a lighter tint towards the front. There are many feathered lines of purple at the extreme base, and the narrow margin of the lip is light rose colour. Although C. *Dowiana aurea* enters twice into the composition of this hybrid (once through C. *Iris* (bicolor x *Dowiana aurea*), C. *Gaskelliana* dominates in colour and destroys the yellow of other parents.

LAELIO CATTLEYA ARMADA WESTONBIRT VARIETY.

MR. ALEXANDER also sends a flower of the latest cross between L. C. *luminosa* (L. *tenebrosa* x C. *Dowiana aurea*) and C. *fulvescens* (*Dowiana aurea* x C. *Forbesii*), for the original form of which an Award of Merit was obtained at the Royal Horticultural Society's meeting on September 25, 1913. The present variety has a flower over 7 inches across, of which all the segments are broad and of fine substance. The sepals and petals are light chrome yellow with a slight bronze shade, the lip crimson with a rich bronzy orange disc, and lines extending therefrom to the base. The column is creamy white. The yellow of C. *Dowiana aurea* is well fixed in this hybrid. *Laelia tenebrosa* in L. C. *luminosa*, which is favourable to yellow crosses, helping in that direction.

THE ALPINE GARDEN.

MORISIA HYPOGAEA.

MORISIA HYPOGAEA is a plant in which I have taken much interest, especially as I was among the first in this country to grow it on its reintroduction, after it had been lost. (It was flowered by Mrs. Murray in 1854, and was figured in Sweet's *British Flower Garden*, second series, tab. 190.)

After growing it for some years, it seemed to me almost incredible that it should have gone out of cultivation. Certainly its intrinsic beauties would ensure it a place in any good garden, so that want of charm could not have been the cause of its practical disappearance. It is, I think, to the question of its duration that we have to turn to account for its loss. It has a curiously tantalising habit of disappearing without apparent cause from many gardens, and this after it has proved a great success for a time. I have never been able to satisfy myself as to the cause of this failure. The best plant I ever grew was on the upper part of a low terraced colony facing south-west, and in dry, sandy soil. It was treated in dry weather in summer to occasional thorough soakings of pure water, which the open, porous soil absorbed readily. This plant became about a foot across, and was covered with fine yellow flowers. It had, therefore, to be removed to another position in the same garden, differing little in aspect, and not at all in soil. The removal was effected by soaking the plant well with water, pressing the soil rather firm, lifting the clump with earth attached and replanting at once. It never looked back, and thrived well until about two years after, when it vanished without any apparent cause. Smaller plants have also shared the same fate, and in my present garden, in a lightly colder part of the same county (Kirk-

endbrightshire) I have also lost several plants of *M. hypogaea* after they were apparently doing well.

Many years ago, when visiting the nursery of Messrs. James Backhouse and Son, at York, I saw their stock of *M. hypogaea* in a frame, then under the charge of Mr. W. A. Clark, who was my cicero. They were apparently growing in almost pure sand, and were thriving and spreading satisfactorily. It seems to me, if I may hazard the remark, that the cause of loss may be the decay of the central crowns of the plant before the growths from the sides have become strong enough. *M. hypogaea* increases well by root-cuttings, and is inclined to send up side growths from the roots at a short distance from the plant. I have never seen seeds produced. I have not found that the plant has any preference for lime, but it is quite probable that lime will help it in some soils. The late Mr. Daniel Dewar, when at Kew, recommended a "light, rich, gritty soil." *S. Arnott, Sunningwell, Marlborough.*

Brier, but a little longer. The blooms are cardinal red when first open, but when fully expanded they are dark red, and each bloom measures about 2 inches across.

The plant is perfectly hardy and very free-flowering. It does best when growing in good tuft loam, but will thrive in any well-worked garden soil, provided an open position is chosen where it can enjoy the full sunshine. The Rose is at its best when allowed to grow freely, and much pruning is a disadvantage. It is only necessary to shorten the longest growths sufficiently to keep the bushes of symmetrical shape. The colour of the flowers has been found to vary considerably in some of the seedlings.

The best forms, such as that which gained the R.H.S. Certificate, are propagated by budding.

THE MARKET FRUIT GARDEN.

FRUIT TREES IN GRASS.

Mr. W. J. Farmer, on page 62, confirms the judgment of many observers as to the fruit of

FIG. 37. ROSA MOYESII. FLOWERS BLOOD-RED.

ROSA MOYESII.

Among the several new Roses which have been introduced to our gardens during recent years, the majority of which are from China—none is more beautiful than the Western Chinese species *Rosa moyesii* (fig. 37), which was discovered in the mountains of Szechuan, at elevations of from 7,000 to 9,000 feet above sea-level. The honour of its first discovery belongs to Mr. A. E. Pratt, but Mr. E. H. Wilson also met with it during his earlier expeditions, and he sent seeds to the Coombe Wood Nursery of Messrs. James Veitch and Son, where numerous plants were raised; the species is now fairly well known in this country. This striking new Rose has been exhibited at several of the fortnightly meetings of the Royal Horticultural Society, and the Floral Committee conferred upon it a First-class Certificate on June 20, 1916, when it was shown by Mr. J. Allgrove, who had fine fruiting branches at the National Rose Society's show in the Drill Hall on Tuesday last. The fruits, which are illustrated in fig. 38, are orange-sealed.

The specific name was bestowed in honour of the Rev. J. Moyes, a missionary in China. The plant forms a shrub about 6 to 10 feet high, and has foliage somewhat resembling that of a Sweet

Apple tree in grass being more highly coloured than that of trees of the same variety on arable land. But he does not add that the fruits are usually smaller, which my observations lead me to conclude. As to allowing grass to grow up around young trees, trials at Woburn and elsewhere have proved that nothing is more fatal to the healthy growth of the trees. In various parts of the country I have seen miserably stunted Apple trees that were planted in grass, and left without cultivation of the land around them. The two years of such cultivation mentioned by Mr. Farmer are not nearly enough. Some of my Apple trees were so badly stunted by allowing the part of the orchard containing them to grass itself over when they had been planted ten years, that I had the land dug up and kept under cultivation. This, however, was on poor land. On very good land young trees, say after growing for six years under arable conditions, may flourish after the land has been grassed. This, however, is in spite of the grassing, and probably in the best of soil they would flourish better still if the land were kept under cultivation some years longer. As to the financial aspect of the question, I am disposed to agree with Mr. Farmer in thinking that mature trees pay better in grass than in cultivated land, but I would not say the same in respect of young trees. *Southern Grower.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See also Tables in *Gardeners' Chronicle* for July 28.)
(Concluded from p. 102.)

IRELAND.

MEATH.—We had a very long and severe winter, with north-east and east winds up to the first of May, which crippled growth. Even when the blossoms appeared in May the weather was damp, and there was no sunshine, so that the pollen of most blossom perished. The weather in June was more like April, and the few fruits that did set turned yellow and dropped, so that it is one of the worst fruit seasons known here for many years. The soil is of good quality for fruit growing. *Michael McKeown, Julianstown, Drogheda.*

TYRONE (N.).—Plums are scarce, and during the past few years silver-leaf has caused the death of many trees, particularly of the Victoria variety. Gooseberries were in some instances a complete failure, due in part to the birds taking the buds during the severe weather in April. Apples and Pears carried a tremendous amount of blossom, which apparently set well, but from some obscure cause (possibly imperfect fertilisation) much of the fruit dropped, leaving only fair average crops. The soil is a heavy loam. *Fred. W. Walker, Sixon House Gardens, Sixon Mills.*

CORK.—All fruit trees produced a great profusion of bloom, but as a result of the prolonged drought, and cold nights at the same time, the crops are somewhat irregular. All Apple trees that gave a heavy yield in 1916 are lightly cropped this season. Gooseberries suffered in many places from the severe frost and snow in March and April. Winter moth and sawfly caterpillars were very prevalent, but, generally speaking, insect and fungus pests were not so troublesome as in other years. *J. Deane, 17, St. Patrick's Terrace, Magazine Road, Cork.*

KERRY.—There are satisfactory crops of all kinds of fruit this year. There was a wealth of blossom on fruit trees of all kinds, but the flowers of Pears and Plums opened a month later than usual. *Charles W. Bennett, Muckross Abbey Gardens, Killarney, Co. Kerry.*

KILDARE.—The Apple crop was destroyed by late frost, and Morella Cherries dropped a good deal of fruit. All small fruits, with the exception of Gooseberries, were numerous and good. The soil is a medium loam on limestone. *Wm. Oulive, Straffan House Gardens.*

KILKENNY.—All fruit trees blossomed abundantly, about three weeks later than in normal seasons, so that the flowers escaped the spring frosts. Consequently, nearly all kinds of fruits promise to be plentiful. Some of the cooking varieties of Apples are, however, rather disappointing, as, after flowering splendidly under ideal weather conditions, they failed to set, and from some inexplicable cause whole trusses came away from the trees. It was not caterpillar in our case. Dessert Apples, and especially Cox's Orange Pippin, are excellent, and these bring the Apple crop well up to the average. Insect pests have not been troublesome this season, but mildew has been rather worse than usual on varieties subject to this fungus. Bismarck Apple was the worst sufferer. The soil is a medium loam on limestone. *T. E. Tomlin, Bessborough Gardens, Piltown.*

KING'S COUNTY.—Old orchard Apple trees in most places are bearing heavy crops. The young trees, with few exceptions, are yielding only small crops, owing to the late frosts and the dry weather, which caused the fruits to fall. The Strawberry crop set well, but owing to dry weather the fruits did not all develop, and the crop was quickly over. *E. Clarke, Claremount, Gurry Castle, Banagher.*

LIMERICK.—Apple trees are bearing a small crop this season in comparison to last year. Only about half the usual quantity of fruit-buds developed, and the flowers failed to set well. Pears show an improvement; most trees are carrying a good crop of clean-looking fruit. Plums are also a good crop, but plums are difficult to keep in check, and are doing great damage to the foliage. Early Cherries were a fine crop, but *Mabelle's* were not quite so good, owing to much of the fruit falling. Strawberries were almost killed by the hard winter, and produced only a poor crop. *Henry Xerxes*, *Rockharton*, *Kilmallock*.

QUEEN'S COUNTY.—Apples and Pears are good, although in some parts the codlin moth has been destructive. Aphid has been troublesome on Plum trees. Gooseberries were not quite so plentiful as in former years, but the quality was excellent, and I have seen no signs of the Gooseberry mildew. The soil is a light loam overlying limestone. *G. McGeehan*, *Abbey Leix Gardens*.

WATERFORD.—The fruit crops in this district are well over the average, and of good quality. There was some dropping of fruit in *The Queen* and one or two other varieties of Apples, but an abundance was left. Small fruits were plentiful, and the bushes are wonderfully free from pests. *D. Cronbie*, *Curraghmore Gardens, Portlaoise*.

WICKLOW.—This garden is near to the sea, and very much exposed to the east. During the time when the Apples were in flower, the wind from that quarter was bitterly cold, consequently the Apple crop is a complete failure. *Walter Bailey*, *Glenn Gardens, Veltor*.

CHANNEL ISLANDS

JERSEY.—There seems to be a fair average average, both in crop and quality. A very heavy thunderstorm damaged the Strawberry crop, and the storm was followed by very hot sunshine, which rendered the fruit useless. Plums are better than for several years past. The Jersey soil is not very favourable for Plums; there is a lack of lime in the soil. *Thomas Sherrin*, *Imperial Nursery, St. Maude's Road, St. Heliers*.

FRUIT REGISTER.

APPLE GRENADIER

ANOTHER season's trial with this kitchen variety has proved its title to being the best of all early Apples for market, where abundant space is available. In freedom of growth, even when grafted on any kind of stock, cleanliness of foliage, and even-sized fruit, I do not think the variety has an equal. The fruit is ready to gather in July. So far as I know, the variety is not susceptible to scale, which affects *Fort Grosvenor* in some seasons very much.

APPLE NORFOLK BEAUTY

WHEN I saw the original tree of this Apple growing in the garden at *Gunton Park, Norwich*, I was much impressed with its appearance in every respect, and especially its free growth and abundant crop of large, handsome fruits, which for culinary use in September and October have no superior. Some few persons had a fault in its cropping, but a small crop may be owing to wrong treatment. I find the tree succeeds best when the branches are well thinned to allow the light and air to enter among them. This year every one of my fifty trees is bearing a very large crop of big, even-sized, handsome, clean fruits. The variety succeeds admirably as a standard, and does equally well grafted on any variety of stock. *E. M.*

RASPBERRY NOVEMBER ABUNDANCE.

The earliest fruits of Raspberry November Abundance were ripe on the 22nd July in Mr. Allegro's nursery, Langley, near Slough, where the variety was raised some years ago. One shoot, 3 feet long from the ground level, bore

thirty-seven large fruits, which were of excellent flavour. In order to get the best results the plants should only remain two years before re-planting. The new bed should be made in a fresh position, otherwise the plants become a thicket of shoots and fail to fruit well. The variety is a cross between *Superlative* and *Catwax*, and is worthy of more extended cultivation for its fine fruit and excellent flavour. The shoots should be cut to the ground level in the autumn after fruiting is over. *W. H. Divers*.

ON INCREASED FOOD PRODUCTION.

BOLTING ONIONS.

IN March last I planted some fine autumn sown Onions and fully expected a large proportion of them to bolt. Curiously enough, only one did

second growth. Two tops of leaves appeared, and the original bulb eventually split in half, disclosing two lopsided bulbs, both of which attained a good size. About half of them had ripened sufficiently to be fit for pulling and drying by the end of August, while the remainder were still too vigorous to pull and dry with any prospect of keeping or storing. This second growth has made them later than the spring sown ones. Indeed, they were more fit to pull about the middle of June than at the end of August, but they were unusually small then, though both bulbs are now twice as large as the spring sown ones, or more. This looks like anticipating time by a year. They were planted 9 inches apart in the lines, and early in July spring sown Leeks were planted between them, and have already made good progress. The soil was trenched to its full depth (15 inches) and manured, the gravel beneath being forked up. *J. F.*

FIG. 35. FRUITS OF ROSE *MOYSE'S COLOUR* ORANGE RED (See p. 109.)

so, and I promptly removed the flower head, and quite a respectable bulb resulted. I expected it to be lopsided, and in this respect agree with Mr. W. H. Divers (page 73) that bulbs so produced are never shapely, though otherwise quite good for kitchen use. The reason why such Onions are lopsided is because they are a lateral and secondary growth from the primary bulb, which shrivels up and decays after nourishing its offspring. A very large percentage of the other bulbs, which did not bolt, gave exactly similar results in a different way. The great drought in May and June ripened off *Shallots* before they reached their proper size. The autumn sown Onions also ripened up or ceased growing. The heavy thunderstorms about the middle of June started them into a vigorous

DRYING PLUMS AND DAMSONS.

The following method of drying Plums and Damsons is published by the Food Production Department of the Board of Agriculture. The Plums and Damsons should be placed thinly on a tray formed of a frame of wooden laths covered with a stretch of wire gauze or canvas for placing in the oven. The heat may then be raised to nearly 200° Fahr., but, if the fruit at this heat becomes soft and puffy, and looks like bursting, the tray should be withdrawn and the fruit allowed to cool off. As drying proceeds the temperature should be gradually lowered to about 140°; otherwise the fruit may char. When they are thoroughly dry the Plums or Damsons should be withdrawn from the oven and left exposed to the air for a few days until (having taken up suf-

ficient moisture from the air) they are of the consistency of Prunes. The best way to store them then is to pack them in clean, dry well-stoppered bottles—these should be used for all preserved fruit or vegetables so far as possible where no thoroughly dry room is available or the district is peculiarly damp. The less light that penetrates to the dried fruit or vegetables the better the colour as a rule. They can also be stored in wax paper-lined boxes. Preserved Plums should be examined from time to time, and if any sign of dampness or mould should appear it must be wiped off with a dry cloth and the fruit put again into the oven for a little while, to get rid of superfluous moisture. Sometimes the sugar in the Plums may appear on the outside as a whitish or pale grey powder, but this is unlikely to be mistaken for mould, as the fruit remains firm if not too damp, and the sugar is dry, whereas the mould is woolly or fluffy.

JAPANESE PRICKLY SPINACH.

It is stated that considerable consignments of Japanese Prickly Spinach seed are being imported, and it would be interesting to know from those who have had experience in growing it whether this variety crops as well in this country as ordinary Prickly Spinach.

VEGETABLE NOVELTIES.

SUGAR PARSLEY.—This is a much-neglected root, in flavour more like Skirret (*Sium Sisarum*) than any other root I am acquainted with; something between the Celeriac and the Parsnip, but without the rank quality of the latter, which to me is almost nauseating. The roots attain a size about that of a moderate Parsnip. I have not seen the plant attacked with Celery fly or other pest, except slugs. My last hope of a big German strain now blossoming (all the 1912 seed having been finished last year, and failure of seed crop then) looks promising for the harvest. The leaves may be used as they shoot from stored roots like ordinary Parsley leaves: the plant seems to resist frost.

SKIRRET I gave up some years ago on account of slug trouble, but now that I know more about controlling this pest I shall again return to its culture.

RAMPION as a root vegetable has given me no success even with the "amelioris" varieties, but it is a pleasant "Spinach" substitute, and young leaves form an addition or variation in the salad bowl. The plant is attractive when in flower.

CHINESE YAM I only started cultivating last year, and so have not sufficient experience to say more about it; for those who can start plants in heat it is worth consideration; a long account is given by Thompson (*Gardener's Assistant*, 1859)—far more practical and interesting than Vilmorin's article.

BURBOS CHERVIL also finds a place with me; I commend it to those who like Chestnuts. Seed should soon be ripe, and as it may not be obtainable I shall be happy to distribute superfluous seed. I may say that I think its culture difficult, and should be glad of hints; generally, I think, it takes about four years to learn the culture of a new vegetable, but seven or eight years have gone and I have not really mastered this one, though this year's crop is not bad.

PURSILANE, too, is useful, and takes but little room. It is best grown in a frame, open mostly, or under a pegged up cloche. A score of plants under a cloche will give a good dish: the plants are cut close to the ground, and may be expected to give three cuttings. It makes a pleasant sub-arid "Spinach"; the fresh leaves may be used as a salad alone or as an addition thereto; lastly, a dozen leaves cast into soup on the table may make a mediocre noisette into one for the gourmet. I grow only the Golden variety, after trying other sorts.

Seed is easily saved, but remember that the capsules still look green when they deliquesce.

CLAYTONE makes a most useful and succulent salad in the early spring from plants grown in a cloche or frame. I collect chance seedlings in the autumn and put them in a frame. It also makes a "Spinach," but boils down to an alarming extent. I have long given up ordinary Spinach in favour of Sea-kale and Spinach Beets (which require a few leaves of garden Sorrel in the cooking), Rampion, Claytone, Purslane, Basella and Broad Bean tops.

CORN SALAD is, perhaps, well known, but only the poorest variety is usually stocked by English seedsmen. *H. E. Durham.*

BULB GARDEN.

HYBRID LILIUMS.

SEVERAL hybrid Liliams have at one time or another been raised, but most of them were soon lost to cultivation. The variety Parkmannii would appear to have remained with us for about twelve years after it was received from America. The plant received the R.H.S. First-class Certificate in 1890, and the last note I have of seeing it in flower was at a meeting in August, 1891. It will be noted that in Mr. Hayward's hybrid (see p. 86) that grand form of *Lilium auratum* known as platyphyllum was the seed parent, whereas Parkmannii was obtained from the reverse cross, the pollen parent being a typical *L. auratum*. It is to be sincerely hoped that the new-comer will hold its own, and in time be generally distributed.

The most valuable garden Lily that we have of hybrid origin is *L. testaceum*, but strange to say the raiser of this Lily and its early history seems to be unknown. It is regarded as a cross between *L. candidum*, the Madonna Lily, and *L. chalcidionum*. Anyhow, it is a splendid Lily, and thrives in gardens. There are several forms of upright flowered Lilies in the production of which *L. cruceum*, *bulbiferum*, *daburicum*, and *elegans* may have played a part, but no record of their parentage seems to have been kept. Under the head of *Burlankii* several hybrids have been received from America showing the influence of *L. Parryii*, *L. pardalinum*, and *L. superbum*, but the absence of any records has destroyed much interest in them. Another American hybrid is Golden Gleam, a cross between the Siberian *L. tenuifolium* and *L. Martagon album*. This comparative new-comer forms a very graceful plant, with prettily recurved, apricot-coloured flowers. The hybrids between *L. Hansonii* and the different forms of *L. Martagon* are interesting, but cannot be regarded as very ornamental. In 1900 a Lily flowering at Kew aroused a good deal of attention. It was the result of a cross made three years previously between such dissimilar species as *L. Henryi* and *L. Brownii Chloraster*. The hybrid was named *L. Kewense*. The creamy-white flowers were very suggestive of a small *L. auratum*, being without the characteristic tube of *L. Brownii*. Like several other hybrid Lilies it soon disappeared from cultivation. *H. T.*

PLANT NOTES.

MONTEBRETIA ROSEA.

Few plants seem to come more slowly into general cultivation than *Montbretia rosea*, and I was agreeably surprised to see a large number of the plants in a Perthshire nursery recently. The variety is quite hardy. The flowers are of a pleasing rose colour, and have not the stiffness of habit which characterises most of the *Montbretias*. This beautiful *Montbretia* may be commended on account of its graceful leaves and flowers, and its value for supplying cut blooms. Mr. J. G. Baker named it *Tritonia rosea*, and states that it is a native of Cape Colony, from Uitenhage northward to Natal. *S. Arrott.*

THE KITCHEN GARDEN.

By J. DUNN, Foreman, Royal Gardens, Windsor.

PARSLEY.—Plants of Parsley raised from seed sown during the spring, and from which supplies are expected in winter, should be cut off close to the ground. This will result in fresh growth of a stocky nature, and such growth will stand the winter much better than that which is at present on the plants. Hoe the soil between the rows and give a dressing of soot during showery weather. If seeds were sown in July the plants from that sowing will also be benefited by being cut back, and if cold pits are available a good plantation should be made from these plants with a view to providing a supply of green leaves during inclement weather. The soil for this purpose should be in good condition, and brought up to within 18 inches of the roof-glass. Lift the plants and place them in position with great care, watering the roots afterwards to settle the soil about them. Allow the lights to remain off the pit until severe weather is expected, to ensure hardy growth. By these means an unbroken supply of Parsley should be available throughout the winter.

CAULIFLOWERS.—Make the final sowing of Cauliflower seed in a cold pit; for gardens in the south this sowing will be quite early enough to obtain seedlings for the main batch to be planted out in April. Sow the seeds thinly on a firm bed of soil, which should not be more than 18 inches from the roof-glass. When the seedlings are through the surface, remove the light in order to keep the plants stocky. Shift them into 4-inch pots as soon as they are large enough for transference, and stand the pots on a bed of sifted ashes.

CELERY.—Take advantage of dry weather to cut up Celery as the plants become of sufficient size. Only a few inches of soil should be placed round the stems at one time, and this should be thoroughly broken up before it is placed in position. Tie the stems carefully with some soft material, which should be removed as soon as the soil has been carefully placed in position with the hand. Remove all side shoots and small leaves, and see that there is sufficient moisture at the roots before earthing up.

GREEN CROPS.—Keep the hoe at work amongst growing crops while the weather is favourable, so that by the end of the present month the garden may be quite clear of weeds. Late green crops will be benefited by a sprinkling of concentrated fertiliser during showery weather.

CARROTS.—Late Carrots should be thinned at an early stage to 3 inches apart. Carrots sown in April should be lifted before they become too large and placed in store; those raised from seed sown in June may be allowed to remain in the ground for some time to come. At Frogmore we leave the roots in the ground throughout the winter unless they are likely to become large and rough, but for several years the main sowings have been made in the early days of June, which is the best time for this district.

TURNIPS.—Late Turnips should also be thinned and the ground between the rows stirred frequently with a Dutch hoe. The plants will be benefited by frequent applications of soot and wood ashes.

SPINACH sown a month ago should be ready for thinning to 3 or 4 inches apart, and this work should be accomplished before the plants become spindly through overcropping, as they will stand the winter much better than if left unthinned. Slugs are sometimes troublesome with this crop, and should be kept in check by dusting soot along the rows in the early part of the day, while the dew is present on the foliage. Keep the soil always loose by stirring the surface with the Dutch hoe.

POTATOS.—Lift Potatoes directly they are ready for harvesting, selecting those that are suitable as seed tubers. Store the seed tubers in a

well ventilated shed in full exposure to light and air rather than in a clamp until the spring. Tubers which are required for use should not be exposed to the light for too long, or they will soon turn green.

FRUITS UNDER GLASS.

By JAS. HUSSOX, Head Gardener at Gunnersbury House, Acton, W.

MELONS.—With careful attention and a little fire-heat Melons of excellent flavour may be had during the present month. In August the best-flavoured fruits are often those grown in frames, but in September a house provided with artificial warmth is needed to mature the crop. The night temperature of the glass-house should not fall below 60°, and the atmosphere should be kept drier than hitherto, but should the borders be watered freely, the foliage remains healthy the young shoots should still be pinched back, but if the leaves have deteriorated prematurely through insect attacks a few growths should be encouraged to develop. If the crop is a plantful one some of the fruits should be cut a little in advance of ripening and placed in the fruit-room. In no case is it advisable to leave the fruits on the plants for too long at this season.

VINES IN BEARING.—In vintages where the Grapes are well matured the temperature should be reduced, and the amount of ventilation regulated, with the utmost care. In the case of late houses of Black Hamburgh scarcely any fire-heat is needed, but in damp weather and times of heavy dews a little artificial warmth is required, especially in gardens in lowly-lying situations. Later crops of late-keeping Grapes should have warmth to mature the berries perfectly, for if they are not well finished they will not keep well, or be of such good flavour. Aim at a middle course between using so much warmth as to cause shrivelling, and so little as not to be sufficient to develop the highest flavour. It is well known that some of the best flavoured Grapes are frequently those that are shrivelled, but shrivelling is not desirable.

YOUNG VINES.—Young vines of this season's planting should not be encouraged to develop more growth, but do not keep the vines so cool as to run the risk of an attack of mildew. Ventilate the house freely, but reduce the atmospheric moisture and only use the syringe when the weather is warm and sunny. For the present do not in any way reduce the growth. Watch the condition of the border carefully, for it must not be allowed to get too dry, nor should it, if it does, be watered too freely, or growth will still be prolonged. The thorough ripening of the wood is of the utmost importance. See that young vines in pots are not excessively dry at the roots, for this would cause premature ripening of the canes before the leaves have had time to fulfil their proper functions. If the vines are in the open lot them be fully exposed to sunlight and air.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMY COLMAN, Bart., Gaton Park, Reigate.

SEEDLINGS.—Cattleya, Laelia Cattleya, and Brassia Cattleya seedlings raised from late-sown seed should be far enough advanced in growth for transplanting. It is important that each seedling be planted separately at the earliest possible time. Those pricked off now will have time to make roots before winter. Where space is limited, so that the plants cannot be accommodated singly in very small pots, several may be pricked out together in small pans. The orchid may shallow Orchid pan, without side holes, is the most suitable. Seedlings that have matured their first pseudo-bulb will be sending new roots from the base of the growths. These should be re-potted in larger pots, and given every encouragement to grow as quickly as possible. They will not make much growth in the winter, and do not require so much water at the roots or in the atmosphere as in summer; but they must be kept as active as possible, and not rested until the flowering stage is reached, nor must they be allowed to become pot-bound. A suitable rooting

medium is equal parts Osmunda fibre, A I fibre, and Sphagnum moss cut into short portions, adding some crushed crocks, and mixing the whole together. The materials should not be pressed tightly in the receptacles, as it is important that water should pass away quickly. If a house is especially devoted to seedlings of this type of Orchid, it should be kept a few degrees warmer than the one in which the older plants are grown. Should it be necessary to grow them with the older plants, they should be given the warmest and shadiest part of the house, and near to the roof-glass. Seedling *Cypripediums* should be treated in the same manner as described above. Very young plants should be potted in a mixture of Osmunda fibre, Sphagnum moss, and fibrous loam, from which all the small particles have been removed. Chop all the materials into short portions, and add rather a liberal quantity of crushed crocks. The compost should be made moderately firm. Seedlings of more advanced growth, and those nearing the flowering stage, which have filled their receptacles with roots, should be shifted into larger pots, and given a more substantial compost, consisting of at least one-third its bulk of fibrous loam. After the seedlings are re-potted, they should be placed in a warm, moist atmosphere in a shady position. Water sparingly, only keeping the compost just moist by frequent overhead sprays.

SEEDLING CYMBIDIUMS should be re-potted in a similar compost to that described above for *Cypripediums*. The plants should be kept growing actively at all seasons until they reach the flowering stage. They should occupy a position near the roof-glass in a house with an intermediate temperature.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. BARRY, Abbots W. of Godalming, Surrey.

LOGANBERRIES.—The old fruiting canes should now be cut away from the Loganberry, or Fall fruits of this type. They should be cut clean off at the base with a pair of secateurs, then away and burnt. The young canes should then be tied up loosely, the final tying to be done when the canes are bare.

WASPS.—In spite of the late wet weather, wasps are very troublesome. The best method of extermination is to locate the nests, which are usually found in dry banks, mark the nests in the daytime, and when the majority of the wasps have returned at the close of day, push cotton wool or pieces of old rags steeped in a solution of potassium into the holes.

COBNUITS.—As soon as the Nuts easily separate from the husks, they should be gathered. Dry them very thoroughly by exposure in a cool, dry place, safe from the depredations of rats and mice. Find large pots good to keep them in, as the top can be conveniently covered over. The Nuts should be constantly turned.

MULBERRIES. Mulberries should be gathered as soon as they turn colour, or the birds will eat them. The trees, with their dense foliage, generally harbour a quantity of birds. These fruits are very suitable for boiling.

AUTUMN PLANTING.—The preparation of soil for autumn planting may now be proceeded with as time permits. Large holes for orchard planting can be made. On poor, light soils, use well rotted farmyard manure or bone meal; and for stone fruits plenty of lime. The holes should be not less than 4 feet square. Turn over three good spits and break up the bottom. If home-grown trees are to be planted, the end of the present month will be a good time to commence.

THE FLOWER GARDEN.

By W. J. CRISP, Gardener to Mrs. DUMASZEE, Keele Hall, Staffordshire.

TRANSPLANTING SHRUBS.—The soil is now in capital condition for transplanting shrubs, and if the work is carried out during the next two months, the plants will have time to make new roots before the cold weather sets in. Give over crowded specimens first attention. See that the sites for planting are well drained, and trenched at least 2 feet deep. When lifting a tree or shrub dig well below the roots, and, with a fork,

approach the roots gradually, reducing the ball of soil to a manageable size. When planting the holes must be made larger than the roots actually require, so as to allow ample space to spread them out, and in order that the young roots may have plenty of well worked soil to grow into. Tread the soil firmly when filling in the hole, and place strong supports in position directly the planting is finished. During dry weather liberal waterings and occasional sprays will be necessary. In light soils it is difficult to get much earth to adhere to the roots, especially if they have to be removed a considerable distance. In such cases mats should be tied round the roots before removal.

HERBACEOUS BORDERS.—The usual practice of lifting and replanting herbaceous or mixed borders periodically may have to be curtailed this year, but notes should be taken of the varieties that are crowding the more compact sorts. Directly the plants pass out of flower, these overgrown specimens should be lifted, parted, and replanted without delay. Select strong side pieces or shoots, and in most cases discard the centre portion. If the surface soil is lightly forked and mulched, little more attention will be necessary for another year or two, beyond tying, staking, hoeing, and watering. When replanting, the soil must be well dug, and a liberal dressing of well decayed manure worked in, as it will usually be found that the old plants have exhausted the soil.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTHMOOR, Eastwick Park, Kent.

SOUVENIR DE LA MALMAISON CARNATIONS.—If the layers of "Malmaison" Carnations are well rooted and growth active, they should be severed from the parent plant preparatory to potting them. Water the plants freely afterwards, and shade them for a day or two if they show signs of distress through being severed. The compost should consist of two parts good turfy loam to one of flaky leaf soil, with old mortar rubble and sand added. Pot the layers into large 60 sized pots or 5½'s, according to the size of the plants, and afterwards place them in a frame on an ash bottom, and shade them in bright weather. Lightly spray the plants several times daily to keep them fresh. Do not admit too much fresh air in the middle of the day for a time, but increase the amount in the evening. It is important not to over-water the soil; very little moisture is necessary, all the shading is dispensed with. The shading must not be continued for a day longer than is necessary, the object being to assist the plants to become re-established quickly in the new soil. When they have recovered from the check, grow them as hardily as possible. Draw the lights off entirely during bright weather, and never permit a dirty, stagnant atmosphere. In late autumn, when the weather is usually damp and cool, remove the plants to a shelf or stage in a cool house, where they will obtain an abundance of air. In these conditions they will have dry surroundings during the dull winter season, when growth should be practically dormant.

GENERAL REMARKS.—The sunshine is now reduced in power, and shading can be decreased. In the case of stoves and general plant houses, where Palms and Crotons are placed with a general collection of plants, there is often a tendency to shade the whole house indiscriminately. If this has been the custom, the blinds should not be lowered early in the morning, except for a few hours in the middle of the day, and drawn up again sufficiently early to raise the temperature to 60° or 65° by sun heat, when closing them for the night. If the weather is misty or cloudy, blinds should be dispensed with altogether, and the ventilation closely watched. Where permanent shading has been painted on the roof glass, advantage should be taken of a dull and damp day to wash it entirely off. If some especially tender plants must be shaded, arrange them together in one part of the house. At this season of the year, plants must be ripened and the foliage hardened, to enable them to withstand the cold of winter.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publishers.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 56.8.

ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, September 13, 10 a.m. Bar. 29.9, temp. 60.0. Weather—Dull.

SALES FOR THE ENSUING WEEK.

MONDAY.—Sale of Home-grown Bulbs at 67, Cheapside, at 1 o'clock, by Protheroe & Morris.

WEDNESDAY.

Sale of Home-grown Bulbs (for the trade) at 67, Cheapside, at 1 o'clock, by Protheroe & Morris.

FRIDAY.

Sale of Home-grown Bulbs at 67, Cheapside, at 1 o'clock, by Protheroe & Morris.

Food Plants in the Philippines.

The time is approaching when it may need all the prolificness of the East to supply the world shortage of food. When and if that time arrives, the exuberant production of such regions as Java and the Philippines may be called in to redress the unfavourable balance of production and consumption in European countries. Provided that there be sufficient shipping to carry the food, the East, from its almost infinite resources, should be able to make large contributions to our needs. If, however, the Philippines are to supply their quota, the natural resources of the islands will have to be developed with rapidity. As indicative of the food supplies which it may be possible to derive from these sources, the following account of the Food Plants of the Philippines* is of special interest.

The Philippines, lying between the Pacific Ocean and the China Sea, consist of some 3,141 islands, with an area of 119,512 square miles, and a population of eight million inhabitants. The islands are of volcanic origin, and of broken surface of rugged mountains, with rich, level valleys between. The climate of the archipelago is mild and free from extremes. The mean annual rainfall is 96 inches; in the driest regions 52 inches, and in the wettest 156 inches. In no part of the islands are there regions of real drought, nor are there long rainless periods.

The chief crops are Rice, Abacá, Sugar, Corn (Maize), and Tobacco, but in addition to these staple crops the Philippines are extremely rich in species of economic value. Mr. Webster is sanguine that the

Philippines may become not only self-supporting with respect to food, but also an important centre for export. At present, however, these islands, instead of contributing to the general needs of the world, import foodstuffs in considerable amounts. This condition is deplorable, not only as Mr. Webster observes, from the point of view of the islands themselves, but also for the world in general.

With improved agricultural organisation, Mr. Webster predicts that the Philippines will be able to export more sugar and copra, and also starch, Rice, and fruits of many kinds.

Appended to the paper is a list of truly formidable length of the food plants now cultivated in the Philippines. The chief value, however, of the report so far as we in this country are concerned is to direct our attention to the immense food-producing resources of our own tropical and sub-tropical possessions. Reconstruction is in the air as well as on foot, yet we do not remember having heard that the problem of organising supplies from these possessions has received attention. Nevertheless it is a fact that not so far away in Egypt, for instance—there are produced large quantities of foodstuffs, which, in so far as they arrive in this country, do so by the casual route of private enterprise. We would suggest that the resources of all such countries should be investigated without delay, and in so far as it is found practicable, these resources should be drawn upon, with both energy and judgment, to supplement the supplies of the chief staple foods, the organised introduction of which is already engaging the attention of this country. This is a work which might well be undertaken by the Colonial Office with the assistance of traders, agriculturists, and horticulturists. To give but one example of what might be possible, Egypt produces an enormous Onion crop, available for export. There would appear to be no reason why the Onions from Egypt should come to us in their present bulky form. Dried, they would occupy about one-sixth of the cargo space, and, provided they were not dumped here at a time when home supplies were plentiful, they should find a ready market, and benefit the consumer without disadvantage to the home producer.

LEGISLATION REGULATING THE IMPORTATION AND SALE OF FERTILISERS, FARM FOODS, SEEDS, AND PEST REMEDIES IN SOUTH AFRICA.

An Extraordinary issue of the *Government Gazette* of the Union of South Africa, dated June 25, publishes the text of an Act to regulate the sale of fertilisers, farm foods, seeds, and pest remedies. This Act (No. 21 of 1917), which may be cited as the "Fertilisers, Farm Foods, Seeds, and Pests Remedies Act, 1917," is to come into operation on a date to be fixed by a Proclamation of the Governor-General; it repeals the similarly named Act (No. 20 of 1907) of the Cape of Good Hope, and provides, *inter alia*, that no person may sell as a fertiliser any article which does not contain, in a form or combination available as plant food, nitrogen, or phosphoric oxide, or potash or

lime. Every person who sells any fertiliser or farm food must, at the time of delivery, furnish the purchaser with an invoice stating the quantity sold, the name and/or brand under which the fertiliser or farm food is registered, and also the chemical constituents thereof. That statement in the invoice is to be deemed to be a guarantee that the article is as described therein. The Act further provides for the labelling of packages of agricultural seeds, so as to show the name of the seeds and the percentage of purity and germinating capacity. It is also provided in the Act that no person shall import into the Union any bones for the purpose of manufacturing therein any fertiliser, or import, or have or expose for sale therein any fertiliser manufactured from bones outside the Union, unless he produces a certificate signed in the country of origin by a person designated by the Minister of Agriculture that the bones or fertiliser have been completely sterilised. Provision is also made for the inspection of imported fertilisers, farm foods, seeds, and pest remedies, and for their disposal as directed by the Department of Agriculture, if found to be otherwise than required by this Act. The text of the above-mentioned Act may be consulted by British firms interested at the Department of Commercial Intelligence, 73, Basinghall Street, London, E.C. 2. *The Board of Trade Journal*.

SCARCITY OF FERTILISERS.—In view of the general shortage of artificial fertilisers, it is urged by the Food Production Department that they shall be used for increasing the yield of food crops only, and not in the cultivation of flowers.

CONDITION OF THE CROPS.—The monthly report on the condition of the crops issued by the Board of Agriculture on the 1st inst., states that the corn harvest generally began throughout the country during August, and probably the bulk has been cut, but in most districts comparatively little has been carted. From most parts sprouting of the grain is reported. Owing largely to the high winds having shaken out a good deal of grain, particularly Oats and Barley, the prospective yields are not so good as a month ago, while the quality has also generally been affected. None of the corn crops is up to the average; Barley is generally the best and Oats the poorest. Prospects are worst in the eastern counties. Beans are a very bad crop, but Peas are better, though considerably below the average. Potatoes are everywhere over average, especially in the eastern counties, although not quite up to the promise of a month ago. They have suffered somewhat from rains. Disease appears to be prevalent in the south-west, but apart from that area, although it is mentioned in many other parts of the country, there is generally less than usual, and some districts are reported free from it. Turnips and Swedes are average or rather over throughout the west and south, but much under normal on the eastern side of the country from Essex to Northumberland, so that on the whole prospects are for a crop rather below average. Their disappointing appearance in the east is largely due to the difficulty of obtaining a plant earlier in the summer, and to damage by fly. In some parts of the country the rains during August have improved the crop, but in others it has been too wet for these roots. Summarising the returns, and expressing an average crop by 100, the appearance of the crops on September 1 indicated probable yields which may be expressed by the following percentages:—Wheat, 95; Barley, 97; Oats, 90; Beans, 80; Peas, 91; Potatoes, 104; Turnips and Swedes, 96; Mangolds, 103; Hops, 99.

WAR ITEMS. We regret to learn that Mr. E. E. RISELEY, librarian of the Linnean Society, has been killed in action.

—The fourth free gift sale of the Dumfries and District Horticultural Society for the benefit of war charities, held in St. Mary's Hall, Dumfries, on the 15th ult., realised upwards of £78.

* By P. J. Webster, Horticulturist, Samar Expt. Station, the *Philippine Agricultural Review*, IX., 8, 1916.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

EUSTOMA RUBSELLIANUM.—In the note accompanying the illustration of *Eustoma Russellianum* on page 97, no mention is made of a white-flowered form. At Key, however, some time ago, I noted a variety named *Alba*, in which the blossoms were almost pure white. The date according to my notebook, was July 9, 1913. W. T.

In the note which accompanied a figure of this beautiful plant in your pages last week it is stated that the rose-coloured variety shown by Mr. C. J. Ellis is a hybrid. I saw this plant at the R.H.S. meeting, and questioned Mr. Ellis as to its origin, and I am satisfied that it is nothing other than a colour sport from the type. White sports sometimes occur among a batch of seedlings of this plant. The suggestion was hazarded at the meeting by someone that Mr. Ellis's plant was a hybrid, which led to a careful comparison of it with the type, but no difference could be found either in habit, foliage, or flower except that of colour. It would be worth while to cross the purple, rose, and white forms, in the hope of obtaining greater variety of colour. W. Watson, Kent.

APPLES IN EAST LoTHIAN.—Your correspondent on p. 52 states that the Apple crop in his district of East Lothian is under the average. This is not my experience. The orchard of which I have charge contains about 300 trees, nearly all of pyramid shape, with a few as cordons, and all are worked on the Pear dise stock. The majority of the trees are ten years old, and they include 41 varieties of Apples. It is not intended to grow such a large number of varieties permanently, but the sorts now grown are under trial in order to ascertain what are good and reliable croppers in the particular district. The garden is situated in the western part of the county, and the soil is a light, rich loam, about 2 feet or depth overlying whinstone. For the last year or two, Mr. Astrachan has been the best cropper, and good as this variety has been in the past, it has excelled itself this season. This year the crop is remarkably large, but the fruits are smaller in colouring than usual. The colour is a rich, is superb. This Apple, I believe, has the reputation of being not quite hardy, but that is certainly not my experience in this garden. Du hes of Oldenburg is also a heavy cropper here, the trees being laden with excellent fruits. Other varieties bearing heavy crops are Mr. Gladstone, Lady Sibley, Beauty of Bath, King of the Pippins, Sterling Castle, Claygate Pearmain, Bramley's Seedling, Worcester Pearmain, Bramark, Grayvein, Warner's King, and Irish Peach. Average crops are being yielded by Ribston Pippin, Margil, Bon's Red, Groschener, Hector Macdonald, and New Northdown. Smaller crops below the average have to be credited in the varieties James Grieve, Eldonville Seedling, Potts' Seedling, Lord's Prince Albert, and Scarlet Victoria. I am surprised that the variety James Grieve has always turned out more or less of a failure, but a well-known Scottish pomologist informs me that I have probably a spurious stock. I am informed that there are at least two or three stocks in commerce that are not true. Of recently planted sorts, Roy, W. Wilks, which is now fruiting for the first time, gives every indication of becoming a reliable variety. Cardross Green not a novelty by any means, but new here, is a grand cooking Apple. It somewhat resembles Sterling Castle, and is a most promising cropper. For some reason or other this variety has never become well known, and it must be at least a quarter of a century ago that it received the First class Certificate of the Royal Canadian Horticultural Society. As Cox's Orange Pippin is useless here, I have planted King of the Pippin and St. Edmund's Pippin, both of which are remarkable for fine flavour. I have two high class American dessert varieties under trial as cordons, but they are only maiden trees, planted last year. They are Grimes' Golden Pippin and Winter Banana. Both sorts are already highly promising, especially the former. George M. Taylor.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 11.—The fortnightly meeting on Tuesday last was of more than usual importance, for besides the exhibits staged before the respective R.H.S. Committees, the National Rose Society, and the National Dahlia Society held special floral meetings in conjunction with the R.H.S. Show. The exhibition was favoured by beautiful weather; the wealth of flowers and the numerous visitors reminded those present of the Vin-

sen difficulties seen to hinder the progress which is being made, and although fewer novelties received recognition on this occasion than was the case last autumn, many fine seedlings were forthcoming. The groups of Roses displayed both by nurserymen and by amateurs were beyond praise, not only for the fine development and excellent culture of the flowers themselves, but also for the tasteful manner in which they were staged.

Besides the awards to the Dahlias, the Floral Committee made an Award of Merit to a beautiful Crab, shown by Messrs. J. C. Munn and Sons. The principal groups in the Floral section were composed of Dahlias, ornamental foliage, and

THE ORNAMENTAL DAHLIA, COMMANDEUR, CRAB, AND PEACH, ALL ON YELLOW. THE SEARBY CRAB ON.

(See Article in the October Issue of 1917.)

cent Sparte exhibitions in previous days. All sections of horticulture were represented, but the chief exhibits were Dahlias and Roses. At the last meeting, the new Dahlias submitted for award were judged by a joint committee of the R.H.S. and the National Dahlia Society. A very large number was considered of sufficient merit to be given the joint award. The Dahlia classes, although not so important as in former days, were well represented, and the exhibits, though few, were of a high order of merit. The display revealed the direction in which modern taste seems to be tending, namely, towards the more decorative garden types, such as the Colorette, Paeony flowered, and "Star" sections. With regard to the Roses, not even the pre-

vious pot shrubs and climbers, and Ferns. Mr. J. B. Rivers, showed many beautiful decorative varieties in a general collection of Dahlias, which included Exmouth Glory, at which the flowers were amber and white, tipped with gold; Pierre Ledebur, a handsome mignon flower, with white-tipped florists; Godfrey's Crimson; and Diana, classed as a decorative Paeony variety, with large, bold, wine red blooms. Messrs. Rivers made a very interesting display of berried shrubs and climbers, and a companion group to this, on the opposite side of the entrance, was a collection of autumn foliage and berries staged by Messrs. J. C. Munn and Sons. The ornamental fruited Crabs in this collection formed the chief feature of the group, a prominent place being

given to the new variety, Cheal's Crimson, which received an Award of Merit. The ALDER RIVER NURSERY Co. showed a fine batch of *Lilium speciosum rubrum* as the centre-piece of a general collection, the most interesting of the hardy plants being *Kirengeshoma palmata*, a member of the Saxifragaceae, native of Japan. The flowers are yellow, and just before they open, hang pendulous, suggesting a small yellow *Lapageria*. The texture of the petals is very stout, as in the last-named genus. The foliage is exceedingly handsome; the big lower palmate leaves are stalked, and the upper ones sessile. Messrs. H. B. MAY AND SONS contributed their usual excellent form of Ferns.

Several collections of choice Orchids were staged, and a number of novelties submitted for award, of which two received Awards of Merit.

Several fine groups of fruit were placed for adjudication before the Fruit and Vegetable Committee. Mr. J. C. ALLGROVE showed pot trees of Apples and Pears, and baskets of gathered fruit. The trees were magnificent specimens, and laden with fruits. One of Pear *Triomphe de Venne* bore a crop of twenty fruits, of exhibition size and quality, and the branches of bush trees of Apple Cox's Orange Pippin were weighed down with choice specimens. Perhaps the most remarkable were miniature trees of Apple the Rev. W. Wilks, bearing fruits almost as large as the pots in which the trees were planted.

JOHN A. NIX, Esq., Tilgate, Crawley, exhibited a collection of hothouse fruits comprising some thirty dishes, all of superb quality, and well arranged. The bunches of Grapes were of very fine finish, especially Muscat Hamburg, Madresfield Court, and Gros Maroc Peaches Grosse Mignonne, Thomas Rivers, Prince of Wales, Walburton Admirable; Nectarines Victoria and Humboldt; Plums Jefferson, Belgian Purple, and Coe's Golden Drop; Apples, Pears, and Brown Turkey Figs, were particularly fine. Mr. H. CROSE, Orpington, contributed hardy fruits, of which the most remarkable were the culinary Apples. Mr. E. A. BUNYARD showed bunches of Grapes of the Frontignan type grown in a small, unheated greenhouse. The flavour was excellent, especially of Primaviv Frontignan, Early Saumur, White Frontignan, White Sultana, and Ascot Citronelle.

Floral Committee.

Present: Messrs. H. B. May (chairman), E. H. Jenkins, H. Jones, J. Dickson, E. Dixon, W. P. Thomson, E. F. Hazleton, C. B. Fielder, J. F. McLeod, John Heal, J. T. Bennett Peck, G. Reuthe, E. A. Bowles, S. Morris, W. G. Baker, J. Green, W. A. Cranfield, A. Turner, J. W. Blakey, and W. Howe.

AWARDS OF MERIT.

Crab Cheal's Crimson.—A beautiful form of *Prunus prunifolia* var. *coccinea*. The long branches were crowded with red fruits about the size of Cherries; the stalks were about an inch long. The colour of the fruits is vermilion, with a delicate pinkish bloom. The foliage resembles that of the common Plum. Shown by Messrs. J. CHEAL AND SONS, Crawley, Sussex.

DAHLIAS.

Alma.—A large, pure white, decorative Paeony variety, with florets from 1 inch to 1½ inch broad. The massive blooms, each with a neat golden centre, are held well erect on stout stems. The variety is semi-double, and large without being coarse.

Pendule.—A single, decorative variety of fair size, and distinct in colour. The light green stems are unusually long, bearing the flowers well above the foliage. The colour is old rose and white, the latter occupying the central portion and apex of each segment, while the rich, old rose colour appears at the base and along the sides. Both shown by Messrs. J. BURRELL AND CO.

Dominion.—A Cactus variety of full exhibition size and excellent form. The slender tips of the flowers incurve slightly, but not sufficiently to spoil the shape in the smallest degree. The colour is deep amber—a distinct shade.

Guardian.—A large and solid-looking garden Cactus variety; the blooms are borne on stout

stems and held well erect. The colour is deep, and dark orange-scarlet, with a flush of maroon. Both shown by Messrs. J. STRELDWICK AND SONS.

Unfold.—A decorative variety, the bold blooms of which are about 8 inches across, and of fine, regular form. The broad segments shorten gradually towards the centre, and overlap. The colour is deep, soft orange-salmon.

Sea Horse.—A solidly-built decorative variety, very double, and with long stems. The colour is soft yellow with white tips.

Miss Louis.—A neat Pompon Cactus variety, that appears to be very free in flowering and of great garden value. The modest flowers, borne on wiry stems, are rosy mauve with a suspicion of salmon at the bases of the florets. These three shown by Mr. J. T. WEST.

Joy Belle.—A Collette variety of good size and form. The colour is crimson maroon, with a white, crimson-streaked collar that seems to spread too far and is rather irregular. Shown by Messrs. DOBBIE AND CO.

Moussé Star.—Dainty in pose and colour, this variety has all the finest attributes of its class. The shade of colour is soft mauve, fading almost to white in the centre. Shown by Messrs. J. CHEAL AND SONS.

St. Ewynn.—A large but refined decorative variety, some of the blooms measuring 8 inches in diameter. The flowers have broad florets and are of good shape. The colour is rich pink flushed with salmon. Shown by Mr. CHARLES TURNER.

Royon de Rouge.—A charming decorative variety, about 4 inches in diameter and almost a single. The stems are good, and, as the variety appears to be very free-flowering, it should prove a useful garden Dahlia. The colour is a rich shade of rose-pink, with a bright golden centre from which the golden hue shades out into the pink colouring. Shown by REGINALD COVE, Esq., Duffryn, Cardiff.

Messrs. ALEXANDER DICKSON AND SONS, New-towards, showed a novel Sunflower named *Cactus Star*. The flower bears a striking superficial resemblance to some of the new Star Dahlias, but has a large black disc in the centre. The colour of the ray florets is lemon yellow passing to brighter yellow at the base. The florets are narrow, and have a tendency to reflex, as in some of the Star Dahlias.

GROTES.

The following medals were awarded for collections of fruit:—

Silver Flora Medals to Mr. J. B. RIDING, Chingford, for Dahlias; and Messrs. PIPER'S, for berries and shrubs.

Silver Banksian Medals to the ALDER RIVER NURSERY Co., for Lilies; Messrs. J. CHEAL AND SONS, for ornamental foliage and berries; Messrs. H. B. MAY AND SONS, for Ferns; Mr. G. REUTHE, for hardy plants; and Mr. CHARLES TURNER, Slough, for Dahlias.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. secretary), William Bolton, Arthur Dye, C. J. Lucas, Gurney Wilson, J. Charlesworth, Walter Cobb, Fred K. Sander, S. W. Flory, J. E. Shill, Stuart Low, R. A. Rolfe, J. Wilson Potter, Frederick J. Hambury and T. Armstrong.

AWARDS OF MERIT.

Laelio-Cattleya Commander-in-Chief (see fig. 39) (*C. Iris* × *L. C. Miss Evelyn Norton*), from Messrs. ARMSTRONG AND BROWN, Orchid-hurst, Tunbridge Wells. A most effective hybrid, remarkable for the strong contrast of colour between the light-coloured petals and very dark lip. The flatly-arranged, and partly overlapping, sepals and petals are clear citron-yellow, the lip claret crimson, with thin, gold-coloured lines from the base to the centre. The column is fleshy and white.

Laelio-Cattleya Bronze King (*L. C. Anacantha* × *L. C. luminosa*), from Messrs. ARMSTRONG AND BROWN. A large and handsome flower in which the *Cattleya Dowiana Rosita* in *L. C. Anacantha* shows prominently. The sepals and

petals, which are 7 inches across, are yellow, lightly tinged and veined with rose on the outer halves. The lip is magenta-crimson with fine gold veining from the base; the front has a narrow, lilac-coloured margin.

OTHER EXHIBITS.

Messrs. CHARLESWORTH AND Co., Haywards Heath, were awarded a Silver Flora Medal for an effective group of hybrid *Cattleyas*, *Laelio-Cattleyas* and *Odontoglossums*, with interesting species. New and specially fine plants were *Cattleya Aeneas* (*Venus* × *Dowiana aurea*), with bright yellow sepals and petals and glowing claret-crimson lip; *C. Adula Vesuvius* (*Hardyana* × *bicolor*), a grand addition to the *C. Iris* section, with large apricot-yellow flowers flushed with rose and deep purplish-crimson lip; and *Laelio-Cattleya luminosa* var. *Rosita*, a noble flower with yellow sepals and petals and large purple lip.

Messrs. ARMSTRONG AND BROWN were awarded a Silver Flora Medal for an interesting group of hybrid *Cattleyas*, including several good white forms, *Laelio-Cattleyas*, and others. The *Odontoglossums* included several finely-blotched seedlings. The best of the *Odontiodas* was *Oda. Sentation* var. *roseum*.

Messrs. SANDERS, St. Albans, were awarded a Silver Banksian Medal for a group, in the centre of which was their new *Cattleya Thebes* var. *Britannica*, with bronzy yellow sepals and petals and dark crimson lip. Others in the group noted were three good *Cattleya Adula*, a very dark *Miltaria Morebiana atro-purpurea*, and the new *Cypripedium Robin Hood* (*bingleyensis* Charltonii × *Gaston Bultel*).

Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. Collier), showed the new *Laelio-Cattleya Helene* (*L. C. blotchyensis* × *C. Adula*). The plant carried a good spike of flowers, which have bronzy rose sepals and petals and purple lip. The exhibit included three species of *Anguloa*.

Messrs. HASSALL AND Co., Southgate, showed several excellent varieties of their fine strain of *Cattleya Adula*, three good *Brasso-Cattleya Home*, and a good form of *Cattleya Regina*.

Messrs. FLOREY AND BLACK, Slough, showed several novelties, including *Brasso-Cattleya Lotus* (*B. C. Digbyano-Mossiae* × *C. Rex*), with a fine silver-white flower tinged with rosy-lilac, the lip reddish purple at the base and the centre marked with rose colour, and *Laelio-Cattleya Raiah* (*L. C. Ettrick* × *C. Dowiana Rosita*), with flowers of the *C. Octave Doin* class, with crimson white sepals and petals tinged with light purple.

Fruit and Vegetable Committee.

Present: Messrs. A. H. Pearson (in the chair), W. Wilks, A. Imbick, John Hamson, W. H. Divers, P. C. M. Veitch, H. S. Rivers, J. C. Allgrove, E. Beckett, W. Pompart, J. Cheal, and E. A. Bunyard.

GROTES.

The following medals were awarded for collections of fruit:—

Silver-gilt Knight Medals to Mr. J. C. ALLGROVE, Langley, Slough, and Mr. J. A. NIX, Tilgate, Crawley.

Silver Knight Medal to Mr. H. CROSE, Orpington.

COMPETITIVE ROSE CLASSES.

The National Rose Society's Competitive Classes, in conjunction with the B.H.S. meeting last Tuesday, were arranged on rather a different plan from that familiar to the members of the Society, no money prizes being awarded, and no directions given as to how the flowers were to be shown; the prizes awarded consisted of medals and certificates. A fine lot of Roses were collected together, particularly those of the decorative section; but they were sadly crowded in one side of the hall, the centre and opposite side being devoted to other exhibits.

The nurserymen's groups of Roses were undoubtedly the feature of the exhibition, and Silver Medals were awarded to five groups: To Mr. Hicks for a very bright and cheerful collection; to Messrs. A. DICKSON AND SONS, for a group in which Red Letter Day, Margaret Dick-

son, Hamill, and Kent, were conspicuous; to Messrs. FRANK CANT AND CO. for an excellent group, in which Lady Greenall and the single pink, Mrs. J. E. Salmon, were particularly noticeable; to Messrs. B. R. CANT AND SONS, who showed a fine vase of the Lyon Rose; and to Messrs. W. AND J. BROWN, for a group of excellent Roses, over which baskets of leaves were hung at intervals. The blooms shown in this exhibit were very fresh and clean, but the very confined space hardly allowed for the inspection of the group, which doubtless the exhibitor had not noticed when arranging his stand. This particular exhibit showed to much greater advantage from the gallery of the hall.

Bronze Medals were awarded to Mr. F. LITTLE for a group in which a large central arrangement of Mme. E. Herriot looked very well; to the Rev. J. H. PEMBERTON, Mr. G. PRINCE, and Messrs. WM. PAUL AND SON. The group of the last named firm was noticeable for a fine stand of the China Tea Titania, which is of quite a unique colouring of a shade of coppery pink; another of their new Rose, Mermaid, and two lovely groups of Mme. Léon Pain and W. A. Richards.

Certificates of Merit were awarded to Messrs. T. HARRISS AND CO., H. BERRY, GUYERS TURNER, G. W. AND H. BROWN, and D. PINNOR AND SONS, the two last named exhibitors using dispensing boxes of exhibition Roses amongst their flowers. A like award was made to Mr. J. C. ALLIBROVE for a show of Rose hips. In the centre was a complete plant of Rosa Mayasi carrying its large pear-shaped berries (see fig. 50), flanked by R. Fargesii, and R. setipoda, which were scarcely less brilliant; while the front of the stand was filled with vases of R. magosa, R. rubrifolia, and others carrying fruits.

Turning to the amateurs' exhibits, the First Award for a group of Roses fell to Mr. S. W. BURGESS, who received a silver medal, and he may be congratulated on the success of his first entry in the decorative classes. The Rev. F. R. BURNSIDE and Mr. D. H. DAVIES came next with bronze medals. Mr. DAVIES' group was decidedly the most tastefully arranged of the three, though in quality of flowers Messrs. BURGESS and BURNSIDE excelled.

For baskets of Roses Mrs. COLEMAN HALE was awarded the 1st prize, and Miss CHRISTINE HALE the 2nd, the basket of the latter, though less ambitious than the 1st prize exhibit, being very tastefully arranged. In the case of baskets of Roses the judges evidently found a difficulty in deciding between the competitors, and awarded a silver medal to Mrs. COLEMAN HALE, and another to Mrs. OAKLEY FLEMING. Each lady showed two large bouquets, Mrs. C. PEAR having, in the one case a charming arrangement of Malindi, and the other a mixed bowl; while Mrs. FLEMING'S best bowl contained blooms of Irish Edouard, and a silver vase of Mrs. J. E. Salmon.

For 12 exhibition Roses Mr. R. DE V. PRYON was placed 1st and Mr. W. SANDERSON 2nd.

SEEDLING ROSES.

Some twenty six new Roses, some related and attracted, as they always do, considerable notice and discussion among the visitors. The task of judging these new seedling Roses is a thankless and almost impracticable one, for the prizes are asked, not to compare one Rose with another, but to compare each Rose staged with their ideal of what a Rose of the character before them ought to be. It is small wonder that their decisions are frequently unannounced, and often given to Roses which fail to obtain favour in gardens, or that the Society is constantly endeavoring to find more satisfactory methods of doing the work. At one time reliance was placed on collecting a large number of judges. Then the number was reduced to a smaller panel, and at present a system of pointing prevails, which will, in all probability, come up for reconsideration before long.

Mr. EASTEA showed a pretty quintet of new varieties, two of which seem likely to prove of considerable merit, in the decorative section. These were Lania, a beautifully shaped little Rose of bright orange, and Mrs. H. D. GREENE, a variety resembling a pinker Joseph Hill. The latter had previously received a card of recommendation, and some thought might have had a higher award on this occasion. The spray at the top of the stand showed that it possessed beautiful dark bronze foliage. Lania

is decidedly attractive, but suffered somewhat on this occasion from being arranged in a stand with another Rose, Iphigenia; the other two shown by this raiser were the white Polyantha Little Abg, which is evidently very free in flowering, but has been seen before, and Vesta, a single flower of obscure colouring, very sweetly scented. Mr. PEMBERTON showed another of the series raised by him, with which the public is becoming familiar, the novelty being of a soft yellow colouring, called Dyaltrak.

Messrs. S. McGRATH AND SON showed nearly a dozen new varieties, which, regarded as a whole, were remarkable for their fine colouring. Perhaps the two most notable flowers were Miss Willmott, a fine Rose of soft lemon colour with a shade of flesh or pale pink in the centre, and Queen Alexandra, a flower of curious colouring, the petals being bright scarlet with a trace of orange, and the reflexes old gold, reminding one of a brighter-coloured Juliet. Both these Roses had previously obtained the N.R.S. (2nd) Medal. In shape, the variety Miss Willmott is to be preferred, and the softness of the colouring upon one as it was examined; but Queen Alexandra is quite unique in colour, and gained much by being examined from a little distance, where the two rather startlingly distinct shades of colour in the petals bleached together, giving the flower and group a very bright appearance. Its defect lies in its form, the centre being too much rounded by the incurving of the petals; it is a striking Rose, but lacks the fragrance of Juliet.

The variety Mrs. Bedford received a Gold Medal. The flower belongs to the decorative section, and is of a brilliant orange. J. H. DAVISON and J. de ESCOFFET each received Certificates of Merit; the former is a crimson Rose of no great distinction, but the latter is a remarkably deep crimson shaded with purplish black, from which one might surmise that it had Etolle de France among its ascendants. Though not a particularly large flower, the form is good, and it may perhaps attract an exhibition prize.

Among the other Roses shown by this raiser were Emma Wright, a semi single orange flower of the decorative type, which had already won a Certificate of Merit; Mrs. R. F. Felt, a single flower of pale coloured crimson pink with cream centre, resembling Isabel, and Mrs. Hall Inglis, very similar but a little deeper in colour and with an extra row of petals, making it only semi-double. Good H. Wals of Galley, not unlike a bright Savoy from Ami; Canton Clark, light crimson; and Mrs. L. de Rothschild.

Messrs. ALEXANDER DICKSON AND SONS showed several new varieties. Clive Goodaire received a Certificate of Merit. This is a rather thin Rose of a pale cream colour, perhaps a little after the style of G. de la Reine, but pale. We may expect that when it comes to this country it will require to be shown in the bud, as it seems likely to open somewhat quickly. A like award was obtained by Francis Gaunt, a pale orange-buff flower. Alexander Emble is a fine cherry crimson flower, and, though not so valued by the judges, impressed me as the best of the crimson flowers staged among the new Roses. Other flowers staged by these raisers were Charmelle, a pretty orange-pink; Lady Doreen Stewart, a crimson Lady Dickson; and Mrs. Helen Rosenblath, a pale pink flower.

The premier award at this exhibition was the City Cup. This is given to the best autumn-flowering climbing Rose of the year, and was won by Messrs. WM. PAUL'S Mermaid, a hybrid from R. bracteata, and undoubtedly the most distinct new Rose of the year. It is a large single flower with lemon-cream petals set off by its central collection of yellow stamens. The plant recommending the exhibitor showed robust growth and had beautiful dark, shiny foliage.

Mr. BATES showed a little vase of hips of a Rose he states he grows under the name Rosa anglica. Perhaps R. arvensis (Præ) is correct. If it be this Rose it recalls an old controversy between P. de Coubin and Dr. Christ which led to an elaborate dissertation in *Journal de Botanique Helvétique*, in which he examined the numerous forms allied to R. arvensis of the San Gothard and connected it with R. corifolia and R. abdita. *White Rose*.

COMPETITIVE DAHLIA CLASSES.

The competitive classes held by the National Dahlia Society in conjunction with the R.H.S. fortnightly meeting on Tuesday last, took the place of the Society's annual exhibition. Competition was not keen, and practically everyone who showed gained a prize. The quality of the flowers, and especially single and Pompon varieties, was remarkably good.

In the leading open class for Cactus varieties, eighteen bunches of six blooms each, Messrs. J. STREDEWICK AND SON were the only exhibitors, and they were awarded the 1st prize. The outstanding varieties were the new amber-coloured Dominion, Sir Douglas Haig, Miss Stredwick, Harry Crabtree, and F. W. Fellowes. Messrs. STREDEWICK AND SON were also awarded the 1st prize in the class for four dozen Cactus blooms shown on stands.

Mr. S. J. E. PRYOR, The Laburnums, Preston, Hitchin, led in the class for six Cactus blooms of one variety, with W. E. Peters. He was followed by Mr. A. F. TORRELL, The Viney, West End, Southampton, with Buccanear. Messrs. J. CHEAL AND SONS were the only exhibitors of a dozen garden Cactus Dahlias arranged in vases with suitable hardy foliage; they were awarded the 1st prize.

This firm also won the 1st prize for twenty-four single Dahlias, ten flowers of each, with clean, shapely blooms of Miss Roberts, Beacon, Nympha, Leslie Seale, and others. Messrs. CHEAL had no competitors in the class for twelve fancy single Dahlias, ten blooms of each; their variety Leander, Owen Thomas, and Wm. Parrott being of outstanding merit. The same firm excelled in the class for twelve varieties of Colletted Dahlias.

Mr. J. A. JARRETT, 184, Anerley Road, Anerley, was the only exhibitor of (a) six vases of Paenony-flowered Dahlias, and (b) six vases of decorative Dahlias, six blooms of each variety being shown in each case.

In the amateurs' classes, Mr. S. H. COOPER, The Hamlet, Chippenham, led for two dozen show and fancy blooms, with clean specimens, although some flowers were not yet at their best; 2nd, Mr. R. BURGESS, St. Mary Street, Bedford, for twelve show blooms, Mr. C. LUCKIN, Paulborough, Sussex, gained the 1st place, and Mr. JAS. WATTE, Wood Lane, Chippenham, the 2nd. In the class for six show Dahlias, the prize winners, in order of merit, were Mrs. MAY, Hunt Cottage, Dial Post, West Grinstead; Mr. A. P. INOSSON, and Mr. S. T. WHITE, North End, Eastleigh.

Mr. C. LUCKIN led in the class for six vases of garden Cactus Dahlias, the blooms associated with suitable foliage, including grasses. In a similar class for two varieties, six blooms of each, Mr. S. T. WHITE was the only exhibitor, and was awarded 1st prize. Mr. PRYON showed a capital exhibit in the class for nine Cactus varieties, three blooms of each, and secured the 1st prize; 2nd Mr. INOSSON. Mr. LUCKIN secured the premier award for six Cactus Dahlias, three blooms of each. Mr. PRYON had Mr. LUCKIN in the class for a dozen Cactus blooms staged on boards. For six varieties, similarly staged, Mrs. MAY, Mr. S. T. WHITE, and Mr. S. H. COOPER won in the order of their names. In the class for twelve Cactus blooms in four varieties, three blooms of each, Mr. LUCKIN was placed 1st, and Mr. BURGESS, St. Mary Street, Bedford, 2nd.

Mr. H. BROWN, Luton, won the challenge bowl offered for twelve varieties of Pompon Dahlias, six blooms of each, with clean, bright blooms; 2nd Mr. INOSSON. In the class for six Pompon varieties the awards were made to Mr. J. WATTE, Wood Lane, Chippenham; Mr. S. H. COOPER, and Mr. D. B. CROSS, Highgate, in this order. Mr. A. BROWN, Langrave, had Mr. LUCKIN in the class for six blooms each of six varieties of single Dahlias.

Mr. JARRETT had matters almost all his own way in the classes for (a) four vases of decorative Dahlias, (b) six vases of Paenony-flowered varieties, (c) six Collette varieties (six blooms of each), (d) six Collette varieties (three blooms of each). In the three former classes he was the only exhibitor; in the two last named classes Mr. S. T. WHITE was placed 2nd.

CORY CUP.

There were two entries for the Cory Cup, which was offered for the best group of decorative garden Dahlias arranged on a space 25 feet by 5 feet. Hardy foliage and grasses were allowed for decoration. Messrs. GARDNER PAPE AND CO., London Wall, won the Cup, and Messrs. CHALM were second. The former firm had a bright and attractive exhibit, in which almost all sections of the flower were represented.

BRITISH WHOLESALE FLORISTS AND HORTICULTURAL TRADES.

SEPTEMBER 11.—At a joint meeting of members of the British Wholesale Florists' Federation and the Horticultural Trades' Association, held at Essex Hall, Essex Street, Strand, W.C., on Tuesday last, it was decided, in the event of a general imposition of duties on goods imported after the war, that these two trade associations would support the Government in placing duties on imported bulbs, plants, etc., and recommend that such duties should be on the *ad valorem* principle, and that the amount be 25 per cent. Mr. G. W. Leak was chairman. The B.W.F.F. advocated *ad valorem* duties and 25 per cent.; the H.T.A. as represented by those chiefly interested in the distribution and production of bulbs, advocated duties by number, on the American method, and suggested 10s. per 1,000 on Daffodils and Tulips. Mr. R. W. Wallace was the advocate-in-chief of the latter method of collecting duties, but his case for duties by number was rather spoiled by the fact that the H.T.A. subcommittee dealing with trees and shrubs advocated the *ad valorem* method.

CROPS AND STOCK ON THE HOME FARM.

WINTER OATS.

IN the southern counties winter Oats form a profitable crop. In the north they are not so popular, owing to their inability to withstand very severe weather. Even in the south many plots were much damaged last winter and were ploughed up.

In ordinary seasons, however, winter Oats possess distinct advantages over those spring-sown. Owing to their early ripening, they enable a beginning to be made with the harvest at least ten days or a fortnight earlier. Furthermore, winter Oats weigh more per bushel than the Tartarian varieties; and Charlock does not affect the crop, owing to the sowing taking place in the autumn. On many farms Charlock is a terrible pest to spring-sown corn, necessitating much additional labour in cultivation and spraying.

Grey and Black winter Oats are the varieties most usually grown. The former bears the heavier crop, and has stiffer straw. September is the best month to sow the seed, so that the roots may get a firm hold of the soil before winter sets in. Winter Oats may follow a Wheat crop, especially if the latter has left clean stubble. No manure will be required before sowing, but stimulant may be given in the spring if the plant displays signs of weak growth. Deeply plough the stubble once during dry weather, buy some all weeds. Drill, or sow broadcast, four bushels of seed per acre, harrowing once afterwards.

HARVESTING THE CROPS.

The Corn harvest is much retarded this year owing to high winds and rains. The yield may be considerably diminished by "britting," especially in the Oat crop. In many instances, where the corn is laid, weeds and Clover are growing through the straw. Cut all such corn, even if it is wet, but do not tie the sheaves—leave them in crips to be carted loose, as they dry more quickly thus than when bound up.

It is wise to make Oat ricks small, say 3 yards wide and 7 yards long if oblong, or 12 feet in diameter if round. In all cases build them with a ventilator in the middle; an ordinary sledion has rack as used for sheaves, will do this leaving an air passage through the rick. It is not wise to thatch Oat ricks too quickly if there is the slightest suspicion of their becoming heated. Wheat and Barley ricks, if built dry and free from weeds, should be thatched at once,

even if showery weather prevails. A little moisture on the top will evaporate before threshing is done. In the case of Wheat required for seed in October, the straw should be delayed, and the corn will be "cold," which depreciates its value for seed. "Cold" Wheat does not germinate so well as that which is thoroughly dry. E. Molyneux.

Obituary.

ROBERT THORBURN ONEY.—We regret to record the death, on the 1st inst., of Mr. Robert Thorburn Oney, senior partner of the firm of Messrs. T. H. Oney and Sons, seed merchants, Dumfries. Mr. Oney served his apprenticeship with his father; after gaining further experience in a London house, he went to New York and Chicago, in each of which cities he remained seven years. Returning to Dumfries on the death of his father twelve years ago, Mr. R. T. Oney, in conjunction with his brother, Mr. Thomas H. Oney, continued and largely developed the business at Dumfries.

JAMES LAING.—We regret to record the death on the 9th inst., at his residence, Harriotfield, Kilsno, of Mr. James Laing, senior partner of the firm of Messrs. Laing and Mather, nurserymen and seedmen, Kilsno, now incorporating Messrs. Stuart and Mein. Mr. Laing gained considerable experience with the firm of Messrs. Little and Ballantyne, Carlisle, and, in conjunction with Mr. R. V. Mather, established the firm of Laing and Mather at Kilsno about thirty-five years ago. Some years afterwards they purchased the long-established business of Messrs. Stuart and Mein, Kilsno, with which their own firm was incorporated. Mr. Laing had a special knowledge of the agricultural seed trade, and his business capacity was recognised by his neighbours, as was testified by his appointment to various public offices. Some years ago he became tenant of the farm of Harriotfield, Kilsno, where he died on the 9th inst., as stated above.

Correspondents are asked to note that in sending Peaches or Nectarines for identification it is necessary to send also a shoot from the tree, bearing leaves, as the glands at the bases of the leaves assist in determining the varieties. It is also a help if it can be stated whether the tree bears large or small blossoms; the difference between the different varieties in this respect is very marked. It should also be noted that the fruits will be embryoed, however well packed, if they are fully ripe when gathered. Two specimens of each variety should be sent.

BOUL ON VINE-GROWING. E. E. D. *Vines and Vine Culture*, by A. E. BRIDON, 5s. 5d., post free from our publishing department.

CIDER. C. R. M. Ordinary Apples of mixed sorts can be used in making cider. They must be thoroughly ripe and sound when used. As they have but little tannin, they require admixture with astringent sorts, known as bitter-sweets; moreover, many are too acid, so that an addition of bland sorts will be needed. Probably there is no single variety of Apple which will make satisfactory cider. Reckoning at one ton per acre yield from trees about 10 to 15 years' growth (according to soil, exposure, etc.), you will need about 1½ acres of standard trees. You do not state whether grass orchard is intended; probably you will not want to wait so long, and inter-planting with bush trees for earlier yield will be the best plan. For bitter-sweets, Médaille d'Or is early to give heavy yields; 1 to 10 would be about the proper proportion for mixing (as must be a fruit). White Norman is another good cropper (blend also 1 to 8). With regard to bland sorts, Morgan's Sweet and Royal Wilding may be mentioned. Plant also some of the Pommes

à deux fins, such as Gondreville, Gros Locard, and Fenouillet Gris, the last of which is obtainable in this country. You can obtain further information by writing to the National Fruit and Cider Institute, Long Ashton, Bristol.

GARDENERS' BENEVOLENT SOCIETY: C. B., *Khar-toun*. United Horticultural Benefit and Provident Society; secretary, Mr. A. C. Hill, 35, Alexandra Road, West Kensington Park, London.

LUCERNE IN ORCHARDS: *Bledloe*. Lucerne is a nitrogen-accumulating crop, and would fertilise an orchard, if cut two or three times in a season, and left on the ground. The crop would smother weeds to a great extent, and save the expense of hoeing and digging. Planting with Lucerne is better than allowing an orchard to become covered with grass.

MARKET GARDEN: J. L. You do not state the nature of the soil you purpose to cultivate for market produce. If it is light in texture deep ploughing or digging would suffice. But if heavy in character it would pay to trench the ground, especially for planting fruit trees. The drainage and rooting medium will be much improved by trenching, and, once done, the benefit accruing would justify the labour expended. Moreover, the crops, especially of Apples, would be much increased. The use of plenty of manure would be an advantage in assisting the trees to grow quickly. If the glasshouses are to be devoted to Tomatoes or Grapes the amount of labour you mention would suffice, but if such subjects as Carnations and Chrysanthemums are to be grown to take the place of Tomatoes in winter additional help might be required at times. The class of vegetables grown would also affect the question of labour. A variety of kinds is the most remunerative, although Potatoes, for example, would be the least expensive to cultivate.

NAMES OF FRUITS: G. W. Nectarines (1), Viollette Hâtive; 2, Harlowe Seedling; 3, Pine Apple; 4, Elmore; J. H. Dutch Godlin.—*Schaffner*. 1, Hawthornick; 2, Winter Quatzen; 3, Primes Bismarck; 4, Wyken Pippin; 5, Beauty of Kent; 6, Pile's Russet; 7, Jargonelle; H. C. P. 1, Chas. Russ; 2, Bramley's Seedling; 3, Cox's Orange Pippin; 4, Sturmer Pippin; 5, Noneseuch; 6, Lane's Prince Albert; 7, Worcester Pearmain; 8, Irish Peach; 9, Lord Suffield; 10, King of the Pippins; H, not recognised.

NAMES OF PLANTS: E. T. 1, Euphorbia, an unnamed, new species, certainly not *E. lactea*; 2, *Samborivivum* Funckii; 3, *S. tetorum*.—*T. J. L.* *Francoa appendiculata*. The species varies in colour, and your plant seems to be the darkest variety.—*G. H.* *G.* *Hibiscus syriacus* (syn. *Althea frutes*).

PLUMS DISEASED: G. W. The Plums are attacked by Brown Rot disease. Some of the fruits are also "gumming," probably as the result of punctures made by some insect. A note on Mr. Wormald's investigations on Brown Rot disease was published in the issue for August 25 last, p. 76.

ROSE SCARLET RAMBLER: L. W. H. This variety was raised by Messrs. W. Paul and Son, Waltham Cross, Hertfordshire.

SEEDLING POTATOES: *Palmas Green*. Raising new varieties of Potatoes from seed, though fascinating work, requires much experience and knowledge. The seedlings often crop surprisingly well in their first year, but unless you have wide experience you will find it difficult to make a useful choice between them. Probably your best plan would be to consult one of the firms which specialise in Potato-raising with the view to getting promising new varieties taken up by the trade. Otherwise you must arrange for tests of promising varieties to be made on soils suitable for Potato-growing.

MARKETS.

COVENT GARDEN, September 12.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—E.B.S.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing prices for various plants in pots such as Aralia, Asparagus, Aspidistra, Cacti, and Ferns.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing prices for cut flowers and other items like Asters, Arums, Carnations, Chrysanthemums, and Gladioli.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing prices for cut foliage items like Aspidistra, Asparagus, and Canna.

REMARKS.—There is an abundant supply of Aspidistra, including some good rough varieties. The supply of all other leafy plants is abundant, and they are generally ready to sale for them. Muscivora, Dieris, and Phyllis are foremost among the leafy flowers available this week. Forests are getting scarce, and the prices of these plants are rising. Crotalaria are in flower on the whole, of good quality, and the few better quality blooms are soon bought at a high price. Chrysanthemums show little change from last week, but bushy specimens, white varieties are most plentiful, and have a few in price. Coloured double varieties consist of Amaranth, Hovea, Martin, Dorothy, Ashley, and Belle. Spark Canna's double blooms are more plentiful, but white ones are scarcely available for the present, and the red and yellow variety, Sepiamotis is almost over, and Tuberosa are only obtainable in small quantities. Orchids are exceptionally scarce, and many orders have had to be cancelled during the fortnight, the most being those of English Asclepias, which reached the market this week.

Vegetables: Average Wholesale Prices.

Table listing prices for various vegetables like Artichokes, Beans, Beetroot, Brussels, Cauliflowers, Carrots, Cabbages, Cucumbers, Garlic, Greens, Herbs, and Potatoes.

Fruit: Average Wholesale Prices.

Table listing prices for various fruits like Apples, Apricots, Blackberries, Currants, Figs, Grapes, Lemons, Peaches, Pears, Pineapples, and Raspberries.

SITUATIONS WANTED (Continued from page 11)

GARDENER (good Single-handed); Life experience good in good establishments, highly recommended, excellent references. Army discharge, age 31, married (1 child). Please state wages. BUCHER, 41, Westing Road, Walthamstow, Essex.

GARDENER (unmarried) seeks situation; single-handed, age 30 years, two sons, age 16 and 12, years, aged to all outside work—W, 5, Lane Terrace, Cusden Road, Cusden Team.

SITUATION required as THIRD GARDENER, where one or two are kept. Kitchen Garden and Lawns, age 47; single. A HOLLAMBY, 42, Wellfield Road, Streatham, S.W.

FOREMAN (INSIDE), in good establishment, age 42, single, disarmed Army discharge, 10 years' experience, thoroughly practical, good Fruit and Plantman, Propagator, and Decorator, in Italy, entire charge. State wages. FOX, Chiswick Colony Gardens, St. Albans.

LADY GARDENER seeks post as Head, where several are kept, near London preferred, first-class diplomas, good references. F. H., Box 8, 41, Wellington Street, Covent Garden, W.C. 2.

EXPERIENCED WOMAN GARDENER seeks Post as FIRST, under good Foreman, in Glass Pottery, decorative if needed, good references. Please state wages. A. B., Box 6, 41, Wellington Street, Covent Garden, W.C.

THE WEATHER.

THE WEATHER IN SCOTLAND. A. H. B. GARDNER, Glasgow. The weather in Scotland during the last 24 hours has been generally fine, with a few showers of rain, and a light breeze from the west. The temperature has been in the range of 45 to 55 degrees Fahrenheit. The wind has been variable, but generally from the west. The sea has been calm, and the weather has been generally pleasant. The sun has been out for most of the day, and the sky has been clear. The clouds have been light and wispy. The temperature has been in the range of 45 to 55 degrees Fahrenheit. The wind has been variable, but generally from the west. The sea has been calm, and the weather has been generally pleasant. The sun has been out for most of the day, and the sky has been clear. The clouds have been light and wispy.

TREES AT TORTWORTH COURT.

ON the occasion of a recent visit to Tortworth Court, Gloucestershire, I was glad to find that little damage was done during the late severe winter to the numerous rare trees there. It is always a source of pleasure to me to see there, in a flourishing condition, many trees which I have introduced during the last fifteen years, but which will not thrive at Colebourne. However often I go to Tortworth, I always find something new, and learn something about trees which I did not know before, and the care with which the trees are planted, staked, pruned, and attended to for years after planting makes the place a model to arboriculturists. The lowest temperature recorded during the last winter, according to Mr. Banting, the head gardener, was 7°, and neither the heavy snow, which did so much damage at Colebourne in March, 1916, nor the gales, seem to have seriously injured the trees. One of the newly planted species which has come through successfully, and which may now be looked upon as hardy in the warmer parts of England, is the Giant Cypress of Formosa, *Cupressus formosensis*, which shows a remarkable peculiarity in the swellings at the base of the branches, which I did not notice in its native country. My own plant at Colebourne was killed by frost (32°), and the new (?) species of Alder which grows with the Cypress in Formosa, and is probably the largest and finest Alder in the world, shared the same fate. A plant of *Cupressus sempervirens*

raised from seed sent to me from Cyprus, which has the most narrowly fastigate habit of any that I have seen, is flourishing just outside the kitchen garden at Tortworth, while at Colebourne it has been killed, together with older plants of the same species which I raised from seeds gathered in the English cemetery at Rome. A *Cryptomeria*, raised by me from seed sent from the Akita forest in North Japan, which is illustrated on plate 38 of *The Trees of Great Britain and Ireland*, is thriving remarkably, and convinces me that in the west of England, on suitable soils with good shelter, this may prove a valuable forest tree, as I had already suggested on page 140 of our work, after seeing it mixed with Larch and Corsican Pine in a plantation at Tany-jwleh in Merionethshire. I must add that the Japanese system of raising this tree from cuttings has proved as successful at Colebourne as it is in Japan. The large tree of *Fagus obliqua*, which was raised from the seed that I collected in Chile in 1902, is now over 25 feet high, and is producing seed freely. It may therefore be looked on as a safe tree to plant in the south and west of England, where the soil is suitable. Tortworth is one of the few places in England where the American White Ash grows well, and Mr. Banting assures me that it is dioecious; but a tall, well-shaped tree of *Fraxinus pubescens* has many striking branches, this may be due to its being in too dry a situation.

I saw here for the first time a group of three trees of *Zelkova acuminata*, the Keaki tree of Japan, which are perhaps the finest in England. They grow in a grass field outside the park on the road to the Example Farm, and are 30.40 feet high, with boles 5 feet 10 inches to 6 feet 2 inches in girth, dividing at 8.9 feet into many spreading branches. One of these trees was bearing plenty of seed, which, though now unripe, looked as if it would mature before winter. The North American Beech, a rare tree in England, was also bearing nutlets in which the seed seemed mature, and *Juniperus excedas*, also a very rare tree, had berries which I have not seen before. In 1906 I saw on the Isola Bella in Lago Maggiore what I believe to be the finest Camphor tree in Europe, which was planted in 1820. When I saw this tree it was about 75 feet high by 13 feet 8 inches in girth. From its seeds I raised two or three plants, one of which I gave to Lord Ducie without much hope of its proving hardy. It was cut to the ground last winter, but is now throwing up from the root strong shoots which are already three feet high. In 1911 I saw a Camphor tree—the only one I know of in England—about 30 feet high, at Pen-jerick, in Cornwall, and shall be glad to know if this has survived the winter, or if the tree exists anywhere else in England or the south of Ireland. *Aesculus indica* has borne fertile fruit at Tortworth, but it seems a slow grower, and not so happy here as it was at Barton, near Bury St. Edmunds, though I am now told that that fine tree has been cut down. Wilson's

Chinese Paulownia, which until it flowers I suppose we must call *P. tomentosa*, is growing with great vigour at Tortworth, and has been quite un hurt by the winter at Colebourne, where it is now over 29 feet high by 3 feet in girth at only eight years from seed.

Among the numerous rare Oaks is one which Prof. Sargent thought one of the finest trees at Tortworth. This is *Quercus serrata* of Thunberg, a Japanese species also found in China and the eastern Himalayas. It is now 38 feet by 2 feet 2 inches. *Quercus libani* is growing fast and produces acorns freely, but *Q. conferta*, though it is a very fine and healthy tree, produces few or none. *Q. Aegilops*, the Valonia Oak, which I raised from acorns sent from Patras in 1909, though hardy, seems a very slow grower. *Quercus grosseserrata*, from North Japan, is not very thriving, as it has been planted in a rather exposed situation, but when moved to a moister and more shaded soil it will, I hope, recover.

Juglans cinerea, the North American Butternut, is bearing fruit, but does not seem able to make a fine tree in England, as is also the case with *Ulmus racemosa*, the Canadian Rock Elm. *H. J. Elms, Colebourne, Gloucestershire.*

ORCHID NOTES AND CLEANINGS.

BRASSO-CATTLEYA CATHERINE.

A FLOWER of this new hybrid, raised between *Brassavola Dobyana* and *Cattleya Mrs. Myra Peeters* (*Gaskelliana alba* × *Warneri alba*) is sent by Mr. J. E. Shill, gardener at The Dell, Englefield Green, where it is now flowering for the first time. The flower is silvery white, with a slight tinge and veining of pale rose on the petals and lip. The disc of the lip is greenish primrose, and there are light purple markings at the base. The front is finely fringed and tinged with pale rose colour.

ORCHID SALES.

THE first of the autumn Orchid sales will be held at Messrs. Protheroe & Morris' Sale Rooms on Friday, October 5. The catalogue will contain a varied and choice selection of hybrids, and some rare forms of *Odontoglossum crispum* from the collection of C. J. Phillips, Esq., and other raisers. During the war the importations from abroad have been stopped, but efforts of the hybridists have rendered the trade independent of outside supplies, the accumulation of hybrids in the country being equal to the requirements of the present and near future.

ONCHODAS

IN their groups of Orchids exhibited at the R.H.S. meetings Messrs. Charlesworth and Co. usually include their elegant hybrids of *Oncidium* and *Coeloboda*, which, while not so showy as the *Cattleyas* and *Laelio-Cattleyas*, always attract attention. The showiest is the large, dark scarlet *Oncidioda Cooksoniae*, raised between *Oncidium macranthum* and *Coeloboda Noezliana*; and the most graceful the profusely flowering *Oncidioda Charlesworthii* (*O. incurvum* × *C. Noezliana*), with pretty light mauve-colored flowers. At the meeting on September 11 a fine example of *Oncidioda Cybele* (*O. sarcodes* × *C. Noezliana*) was shown with an elegant spike of flowers larger than those of *O. sarcodes*, but with similar, though denser, markings. The ground colour is light yellow, the blotching Indian red. *Oncidiodas* are very easy to cultivate, and most floriferous.

LINUM SALSOLOIDES VAR. NANUM.

The dwarf variety of *Linum salsoioides* illustrated in fig. 40 is rarely met with in gardens, selected forms of the typical plant often doing duty for it. It is quite prostrate in habit, clinging closely to the stones, and producing a profusion of its charming white and purple striped flowers in the spring. Planted between pieces of rock in a sunny position, it will make a tuft some 18 inches in diameter. During the past winter the plant at Kew was killed, and the species suffered a like fate, although they had both been in the same position for several years. They are somewhat difficult to propagate by means of cuttings, although with care they may be increased in this way if cuttings are taken as soon as the young growths are long enough to handle. Seeds do not ripen on the dwarf variety, and even if they did it is very doubtful if the seedlings would come true. W. I. (See also *Gard. Chron.*, July 19, 1913, fig. 22)

out of the question to use the finished chemical products. Santonin itself is very sparingly soluble in water (less than 500.00 in hot). It is obtained from the flower-buds of *Artemisia maritima*, and possibly other species of the genus; not being volatile, it is not suitable for soil fumigation, except by its accompanying volatile oils, and would be effective only as a contact poison when using a decoction of the crude drug. Thymol and menthol offer the advantage of volatility, so that they might be of service as fumigants. Menthol is obtained from the fresh plants of *Mentha arvensis* and *M. piperita*, at first in solution of the volatile oils; thymol similarly from *Thymus vulgaris*, *Monarda punctata*, and *Carum copticum* (Squire's Companion). With the exception of the last-named there is no difficulty in growing these plants, but there would be objection to growing them on the ground and digging them in, especially in the case of the Mint, for it would not easily be eradicated. It would be neces-

AUSTRALASIA.

A NEW ZEALANDER'S REMINISCENCES OF MESSRS. ROLLISON'S NURSERY.

WHEN one leaves the Old Country, and removes to a most distant part of the earth, the pleasure derived from perusing the publications from home connected with one's trade or profession is wonderful. The notes which appeared in the *Gardeners' Chronicle* about the old-time catalogues, and the references to Rollison's old nursery, revived in my mind a flood of memories, for I worked in that nursery in 1872 and again in 1875.

At Mr. Gardner's request I will give what details of the staff my memory still retains. In 1869-70 I worked for Mr. Liversage, florist and landscape gardener, 'Selhurst, Croydon, who rented the triangular piece of ground enclosed by the railways from the L. B. & S.C. Railway Company, and engaged a man named Dan Bryant, from Rollison's nursery, as propagator. Bryant was incensed at the low wages I was getting, and told me to hold on during the winter, and he would get me into Rollison's nursery in the spring. Instead, however, he introduced me to R. Neal and Sons' Nursery, Wandsworth Common, where I stayed till autumn, afterwards removing into the Springfield grounds at Rollison's nursery, under Mr. Dane—or Kane. Later I was transferred to the hardwood department under glass, where I attracted the notice of Mr. W. Buckley, the manager.

In the following spring I was sent to Battle, Sussex, to take charge of the glass in Mr. B. W. Knight's nursery. After eighteen months I returned to Rollison's nursery, and assisted to decorate Victoria Station on the occasion of the return of the Prince of Wales—afterwards King Edward VII.—to London, to take part in a Thanksgiving Service at St. Paul's for his recovery from a severe illness. Shortly afterwards I was sent as foreman to Mr. H. Burnham, gardener to J. S. Walker, Esq., Hunsdon, Bury, Hertfordshire.

The following are the names of a few of the principal men I remember: Mr. William Rollison and his sons George and Tom; Mr. W. Buckley, manager, and expert in aquatic plants; Mr. Van der Mersch, a Belgian, clerk; Mr. Skelton, stove foreman; Mr. Easton, hardwood foreman; Mr. Dane (or Kane), outdoor foreman; Mr. Gould, expert budder and grafter; Mr. Tom Gardner, head packer; Mr. Garvie, packer; Mr. F. Chettleburgh, carpenter; and the night fireman, known as "The General."

I have pleasant memories of the packing shed. I volunteered to assist during busy seasons, as I could make overtime, and the lessons I learned in packing from the "Great Tom," as Mr. Garvie called him, have been of great service to me since. F. Fuller, *New Zealand*.

HARDY FLOWER BORDER.

PHLOX IRIS VERSICOLOR.

SOME of the older variegated-leaved Phloxes are of weak constitution and difficult to retain in severe winters, but within the past few years new varieties of better constitution have been raised. One named *Iris versicolor* has variegated leaves, and is of vigorous growth. The flowers are violet-blue with a deeper centre, and the foliage is beautifully variegated with silver and green. S. Arnott.

FORESTRY.

STUDENT FORESTERS IN SCOTLAND.

IN many of the Scottish forests, students from the various colleges are spending their vacation in tree-felling. The work done has been pronounced satisfactory, and the students themselves have derived much physical benefit from the open-air life.

FIG. 40.—LINUM SALSOLOIDES VAR. NANUM. FLOWERS WHITE, WITH PURPLE VEINING

TYLENCHUS OR EEL-WORM INFECTION: A SUGGESTION.

IN *The Gardeners' Chronicle* for May 26, 1917, p. 217, Mr. J. K. Ramsbottom sums up the modes of remedy and prevention of eel-worm infection in the four categories: 1. Rotation; 2. Treatment of infected ground; 3. Treatment of bulbs; 4. Trap or crop curing.

With regard to treatment of ground, on the lines of active attack rather than the passive method of aiding the growth of the plants by manure, there are some possibilities beyond the use of the chemicals (formaldehyde, toluol, carbon bisulphide, and naphthaline) which are mentioned. In the treatment of man for ascariid parasites, santonin for ascariid, and thymol or menthol for ankylostoma seem to be the most approved agents for directly affecting the worms, and the question arises whether substances of this nature may not be worthy of trial in the case of eel-worm. I believe my garden is free from infection, and so cannot try experiments. Except for pot trial, it would be, of course,

say to harvest and dry them before use. This would add considerably to the expense of treating large areas, even provided that a good result were obtained on the worms, and no bad effect on the plants to be cultivated. It is therefore desirable to find some annual plant which will give the desired products and not be liable to the disadvantage of the readily-rooting perennials. The genus *Satureia* appears to be a possible source, though I have no analytical reference of their constituents; the scent of the plants is suggestive. *S. montana* is an easily rooted perennial, and therefore out of count; on the contrary, *S. hortensis* is an annual which forms fine little bushes when well spaced out. My suggestion, then, would be to crop the latter plant and dig it in about blossoming time; this would hardly amount to following for a season, so far as concerns Daffodils, for they are dormant during the cropping of the Savory. Thymol is an active antiseptic, and has considerable bactericidal power at a dilution of 100/00, so that it may be anticipated that a good many of the soil bacteria would perish in the process. H. E. Durham.

NERINES.

NERINES are among the most striking of all the autumn bulbous flowers that require the protection of a greenhouse. They are all natives of South Africa, and consist of about a dozen species, with some well-marked varieties. Beside these there are numerous garden forms, of which more than a couple of dozen have been given Awards of Merit by the Royal Horticultural Society within the past two decades. It will, however, be a long time before some of them are in general cultivation, as the bulbs are slow of increase. The true species may be divided into two groups; firstly, those in which the segments of the flower are regularly disposed, or nearly so; secondly, those in which there is a marked space between the two divisions. While these last are very ornamental they are in beauty surpassed by the more regular flowers, one of which, *Nerine curvifolia* Fothergillii, is generally known as *Nerine Fothergillii*. The production of flowers of this type has been the aim of most raisers, hence the majority of new varieties are of regular shape. The flowers of *Fothergillii* are of a deep scarlet colour, while in *Nerine corusca*, which is by some authorities regarded as a variety of *Nerine sarniensis*, they are vermilion-scarlet. The beauty of this tone is enhanced by the concavations which over-spread the entire bloom, and thus, when viewed from different standpoints, present the appearance of dew. All the forms of *N. corusca* are not of equal merit, and to the best form—the varietal name of major has been applied. *Nerine sarniensis* (the Guernsey Lily), the blossoms of which are of a carmine-rose tint was formerly sent over in considerable numbers from Guernsey. Formerly, the bulbs were lifted just as the flower-stems made their appearance potted and placed in the greenhouse for the blossoms to develop without check. Of late, however, this practice appears to have been discontinued. *N. Boydii* (see fig. 41) is a comparatively new species with large flowers of rose-pink colour with a darker stripe down the centre of each segment. Of this there is a variety with bluish-coloured blossoms. In some, the divisions of the flower are extensively crisped, notably in the pink flowered *N. flexuosa* and its pure white variety *alba*, as well as the distinct *N. undulata*, or *crispa*, as it is often called. This species has grass-like leaves, and will often flower comparatively late in the season. The pale pink segments are exceedingly narrow. From the fact that the original species are all natives of South Africa it will be understood that they do not require very much warmth, indeed, freedom from frost is all that is necessary for their successful culture. They all very much resent being disturbed at the roots, and re-potting should not be done before it is absolutely necessary. For this reason the compost employed should be of a lasting nature, and consist mainly of loam and sand. Should the loam be of a very heavy consistency a little leaf-mould may be mixed with it. The leaf-mould should be sterilised before use. Different opinions prevail as to the best time to repot the plants. I prefer to do the work as soon as the flowers are over. An essential point to bear in mind in connection with the culture of *Nerines* is that they make their growth throughout the winter and spring. At that time they should be grown in a light position in the greenhouse and regularly supplied with water. When the plants are dormant the pots should be exposed fully to the sun, and water should be withheld in order that the bulbs may ripen. Towards the end of August or in September the flower-spikes develop, after which the soil should be kept moist. Sometimes the narrow-leaved sorts will show leaves before the flowers, in which case they may be watered. B 7

ON INCREASED FOOD PRODUCTION.

POTATO YIELDS.

THE following results of part of a Potato growing competition arranged by the local horticultural society for cottagers and allotment-holders may be of interest to growers generally. In one class prizes were offered for "the heaviest crop of sound tubers obtained from 1 lb. of seed cut into twelve sets." The variety selected was Great Scot, and the seed was carefully weighed by the secretary of the society and myself, put into bags and handed to the competitors early in spring. Where the growers gave their sets every chance, the variety yielded

works out at nearly 40 lbs. per twelve sets, clearly proving that the variety deserves all that was claimed for it by your correspondent in the issue for April 14, 1917, p. 152. When we judged the early variety class in July we found Midlothian Early and Sharpe's Express to be favourite varieties. Growers, however, state that the former sort since then has become badly diseased. The 1st prize was won with a local variety called Short Top. Perhaps a touch of sentiment has induced me to still grow a few Myatt's Ashleaf, but it has done so badly the past year or two that it is waste of ground to grow it any longer. *Colonist*, in the spring, gave a splendid crop in frames; First Crop was good both under glass and in an early border,

FIG. 41. NERINE BOYDII. COLOUR OF FLOWERS PALE ROSE.

very heavily. The crop was lifted and judged on August 29. The winner of the 1st prize, Mr. G. Powell, had 104 lbs. of sound tubers, and 5 lbs. small with just a trace of disease; the twelve heaviest tubers weighed 151 lbs., the largest one 1 lb. 9 oz.; the winner of the 2nd prize had 55 lbs. of sound tubers and 1 lb. of small Potatoes; the third, 51 lb. of sound and 1 lb. of small tubers. As the day was wet some allowance must be made for the damp soil adhering to the tubers, but, even then, the results are remarkable, and I shall be interested to know if the 1st prize result has been equalled this season in similar competitions. The total weight grown by the twenty-nine cottagers who competed in this class is 1,107 lbs. of sound tubers, 444 lbs. of small and diseased ones, which

but Sharpe's Express, for cooking qualities, is still hard to beat. The wet weather is having a serious effect on the Potato crop; the rainfall for August in these gardens was 7.10 inches. The varieties Up-to-Date, Factor, and King Edward, seem to become yearly less resistant to disease. Arran Chief is not promising a heavy crop locally, though, as the haulm is still quite green, if the weather improves, the crop will benefit accordingly. The unsettled weather in July interfered with spraying so much that it hardly had a fair chance; sufficient spraying, however, was done to demonstrate its value, except on Potato-sick ground. In a fruit district like this crops suffer a good deal from the shade and drip of fruit trees, which are a feature of cottage gardens in

Worcestershire, and for a long time I have questioned the wisdom of planting so many fruit trees in gardens to the detriment of other crops. Would it not be better to grow fewer trees in the vegetable quarters in private establishments, and give the fruit trees a place to themselves, especially those grown as bushes and pyramids? *James J. Graham, Howell Gardens, Redditch.*

POTATO DISEASE PREVENTED BY DEEP PLANTING.

As a practical gardener my experience is that if Potatoes are planted deeply late blight disease does not affect them. It has only occurred when the Potatoes have been planted shallow. It has been stated that if seed tubers planted near the surface are afterwards covered by soil no disease will hurt them, but it is much better to plant deeply and prevent disease. That, at any rate, has been my experience. *A. Newson.*

RECUPERATIVE POWER OF CABBAGES.

Being impressed with the value of every leaf to any plant of the Cabbage tribe, I lifted and

a second period of hot, dry weather, about the third week of June, the land was manured, ploughed, and rolled firm. Large plants of Cabbages (9 to 12 inches long) were planted, and during the day leaves and stems lay flat on the ground. All but the youngest leaves turned yellow and withered away, yet in the course of a few weeks there was a splendid field of Cabbages, showing the wonderful capacity of Cabbages to recover from this rough treatment. No doubt the plants would have been much larger if they had been prevented from flagging by the private gardener's method. Nevertheless, they were of large size, covering the ground, and commencing to heart by September 15. *J. E.*

FINGER-AND-TOE IN TURNIPS.

This pest spreads rapidly if measures are not promptly taken to suppress it. Finger and toe is also known as Club Root. It is spread from the first point of attack in various ways; it may be borne in soil that sticks to the plough, to wheels of carts or other agricultural implements, or to the feet of workers, horses or sheep.

THE KITCHEN GARDEN.

By J. DUNN, Foreman, Royal Gardens, Windsor

LETTUCE.—Another sowing of hardy Lettuce may be made on a sheltered border with a view to obtain heads in spring. The border on which the sowing is made should face south and be well raised at the back. Brown Cos, Stanstead Park, and Maximum are suitable varieties. The plants should be ready for transplanting in early spring in a sheltered position, or if cold frames are available, good results may be obtained by growing them in frames in rich soil, placed to within 15 inches of the roof-glass.

FRENCH BEANS.—The latest plants of French Beans in the open should be afforded protection from early frosts by a covering of light material, to be drawn over them without touching the foliage, as often as required. Wires may be strained over the border at a distance of 2 feet from the plants to carry the protective covering.

FRENCH BEANS IN POTS.—If Beans were sown in pots a month ago, they will now be ready for top-dressing. Good, rich soil should be used, pressed firm on the surface. A few twigs should be placed round the plants, to keep them in an upright position. Water freely with weak liquid manure, and keep the plants fully exposed to the light. No fire-heat will be necessary until the weather becomes cold, but the house should be closed in the afternoon. Ventilation may still be freely given during sunny days. Another sowing should be made in 7-inch pots at intervals of 8 or 10 days during the autumn, in order to maintain an unbroken supply of pods.

LEEKS.—The soil between the rows of Leeks should be broken lightly with a hoe, and a liberal supply of manure-water given, especially on light soils. Leeks respond well to liberal feeding during the autumn.

CUCUMBERS.—Plants from which Cucumbers are expected in November and December should now be making rapid progress, and will require very careful treatment in order to promote stocky, short-jointed growth, capable of carrying a crop during the winter. Stop the shoots frequently, and tie them regularly over the trellis, leaving sufficient space between them to admit light to all parts of the house. Remove rough leaves as it becomes necessary, to make room for young growth; decaying foliage is almost certain to become infested with red spider. Overcrowding should be prevented by frequent attention to stopping and tying; if neglected for a few days it becomes necessary to remove large quantities of foliage at one time, which causes a check to the plants. Top-dressing is important during the autumn and winter, and by frequently applying a small quantity of fresh soil to the roots they are kept in a healthy condition. Avoid strong heat, and ventilate with great care. Maintain a moist atmosphere by frequently damping the floor and walls of the house; the foliage may be lightly syringed twice daily during sunny weather. Another planting should be made as soon as possible to produce a supply in January and February. These plants must be grown in a moderate temperature, exposed fully to the light.

TOMATOES.—All unnecessary foliage should be removed from Tomato plants in the open so that the fruits may receive the full benefit of the sun. Remove the fruits as they begin to colour, and place them in a dry vinery until they are ready for use. Plants which are ripening their fruits indoors should be allowed plenty of ventilation and a good supply of manure water. Do not trim the plants too severely; it is necessary to allow a little more freedom of growth at this season in order to encourage root action.

FIG. 42. —NERINE FLEXUOSA VAR. ALBA.
(See p. 117)

transplanted Cabbages, Caul flowers, and Brussels Sprouts, with a trowel, during the great heat and drought of June. This was done during the evening and each plant watered in only once. Practically, not a leaf withered, and there was very little flagging. If this care and time can be given the Cabbage tribe in transplanting, I consider the operator's far better repaid to do it in dry, rather than wet, weather, because the plants grow away immediately without failure, whereas in dull, wet weather there are many failures owing to slugs, especially in heavy or rich soils, and blanks may have to be filled up several times. Bearing these things in mind, I was interested in the remarks of Mr. James A. Paice, in the issue for July 21, p. 24, also Mr. E. Beckett's remarks on p. 68. In contradiction to this case I may mention an observation I made on a market garden in an district where the large numbers and severity of slugs make it impossible to transplant with a trowel. A crop of Lettuces had just been cut. During

Finger-and-toe can be checked by the application of lime, preferably common burnt limestone, applied at the rate of from two to four tons per acre six months (or preferably eighteen months) before the Turnip crop is sown. The lime should be slaked, and either spread by a manure distributor or shovelled direct from carts on to the fields. Forms of lime other than burnt limestone may be used; but if gas lime be dressed the land must not be sown or planted for some months. Chalk has also a preventive influence, but is not so effective as lime.

Bad drainage is a contributory cause of finger-and-toe; so is the neglected growth of Charlock and other cruciferous weeds; and acid manures in wet climates seem to encourage the pest, whereas basic slag, bone meal and precipitated phosphate have an opposite tendency. All whose crops suffer from finger-and-toe are advised to obtain free Leaflet No. 77 from the Secretary of the Board of Agriculture, 3, St. James's Square, S.W. 1.

FRUITS UNDER GLASS.

By JAS. HUDSON, Head Gardener at Gunnersbury House, Acton, W.

FIGS IN POTS.—The pot trees of Negro Largo Figs should be yielding a good supply of fruits. For some weeks past we have been gathering from pot plants, and I do not think there is any other Fig at this season to equal this variety. The fruits are of the highest quality; they keep well, and have a fine appearance. Very rarely indeed do we get a cracked fruit of this Fig. Close the houses whilst there is still plenty of sunshine to raise the temperature to 85° or even 90°. Do not, however, damp down after mid-day. Look closely to the watering early in the day. Keep the night temperature at least as high as 65° when banking up the fires. If the plants suffer a check through low temperatures some leaves may fall and the late fruits be delayed in ripening.

THE RE-POTTING OF FRUIT TREES.—Fruit trees in pots intended for first early forcing should be repotted or top-dressed as early in October as possible. The loam used should be from a stack that has stood at least six months, calcareous, tough and fibrous. If it seems retentive or close, some sandy grit should be added. Two-thirds of the compost should be loam, and the rest made up of well-decomposed manure and mortar rubble. Turn the compost over three or four times, taking the precaution to cover it in case of heavy rains.

NEW STOCK.—If the trees are planted, it will not be advisable to disturb them for at least another fortnight. If not planted, continue to pay close attention to watering. If it is desired to add to the stock of trees, they can conveniently be moved. They should be well established trees, grown in pots from the beginning; such trees will answer better than trees from the outside quarters. Those in 9 to 10 inch pots will be the best to choose, as they are easy to move.

POT TREES IN BEARING. Fruits can be left upon Plum trees in pots until they are required, and the flavour is enhanced thereby. Late Nectarines also hang well, but very late Peaches are disposed to become woolly if left upon the trees too long. As soon as these trees are all cleared of their crops, stand them out side, in full sunshine. If not planted, see that they are secured against damage by winds, and do not let them suffer from want of water at the roots.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Garton Park, Reigate.

TROPICAL ORCHIDS. Owing to the damp, unsteady weather during September and the greater part of August, the growth of most tropical Orchids is softer in texture than usual. Every effort should therefore be made to induce the thorough ripening of the growths and pseudo-bulbs of the inmates of the East Indian, Cattleya, and Mexican houses.

SHADING AND WATERING. It is impossible to give precise directions at this season on the subject of shading. There should in any case be a gradual reduction to harden the foliage, and little shade will be necessary after the first two weeks of October. If, in addition to blinds, shading has been provided by roofing the glass, it should be washed off at once, first stopping the pipes leading into the tanks, so as to prevent sediment from passing into the rain-water. The permanent blinds should be allowed to remain in position, as shading will still be necessary during bright sunshine, but they must be used with discretion; the plants should be exposed to all the sunlight possible without causing damage by scorching. The amount of moisture in the atmosphere must be regulated with extra care until fire-heat is more extensively employed. The cooler houses will require damping the least, as there is less evaporation in these structures. In the warmer divisions sufficient atmospheric moisture must be promoted to counteract the effects of fire-heat,

The East Indian, Cattleya, and Mexican house will require to be damped morning and afternoon, while the cool houses, in which very little fire-heat is employed, should be damped only in the mornings, except on bright days, when the paths and stages should be sprinkled again in the afternoon. Watering must be carried out with due regard to the weather, the conditions of the plants, and the compost used. Plants with pseudo-bulbs nearly completed should receive a gradually diminishing supply, but water must not be withheld to such an extent as to cause shrivelling. As the nights become colder it will be necessary to provide extra fire-heat; on warm days the ventilators should be opened sufficiently to prevent scorching, but retaining as much sun heat as practicable.

THE HARDY FRUIT GARDEN

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVELY, Abbots Wood, Godalming, Surrey.

GATHERING FRUITS.—Continue to gather the fruits as they become fit. Several varieties both of Apples and Pears will now be ready. Among Pears, Marguerite Marillat, Souvenir du Congrès, Beurre d'Amalins, and the later fruits of Williams' Bon Chrétien, will require watching, as the fruits do not all ripen at once. The fruits on walls should be carefully lifted to the horizontal if they are ripe they will readily part from the stem, and should be gathered. Early ripening Apples should be treated in the same manner. James Grieve requires very careful handling or it will show bruises. When the fruit is gathered, take it to the fruit room and store it carefully, arranging for plenty of ventilation.

PEACHES AND NECTARINES.—Late fruits of Princess of Wales, Sea Eagle, and Victoria should be kept in full light, away from the leaves. If the weather is wet or stormy, a few lights placed over them will assist in ripening the fruits. Place a strong rope or wire across the lights to keep them in position, and make them safe against winds.

PLANTING FRUIT TREES.—If a piece of ground has been selected for planting it should be trenched, and if young trees are to be planted in the place of worn-out specimens, or to replace worthless varieties, the old soil should as far as possible be cleared away and replaced by new. Use at least one third of new loam and add to it old hot-bed refuse, or the burnt earth and ashes from the garden bonfire. After the old trees are rooted out, trench the soil to the depth of 2 feet 6 inches or 3 feet, after which fill in with the new soil and material as described. In preparing the ground for Peaches, Nectarines, and all stone fruit, mortar rubble should be incorporated. It is not a good plan to use much manure at the time of planting, unless the ground is very poor, and then the manure must be in a well-rotted condition. Apple and Pear trees grafted on dwarfing stocks are the best for small gardens. All fruit trees should be ordered and planted as early as possible.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTHCOLE, Eastwell Park, Kent.

RAISING CYCLAMENS FROM SEED. If plants of Cyclamen are required to bloom early in the season the seed, if not already inserted, should be sown at the earliest opportunity. Fill seed pans or seed boxes to within half an inch of the top with porous soil. Give the soil a thorough watering, and leave the pans for a time to drain thoroughly. Sow the seeds thinly, and cover them lightly with fine soil, pressing in the seed with a flat piece of wood. Place the seed pans in a house or frame, where a minimum temperature of 55° to 60° is maintained. Shade the seed pans from sunshine; the best plan is to lay sheets of paper, or moss, over the pans until the seeds germinate. Be careful to keep the soil always moist, but do not make it sodden by over-watering.

SCHIZANTHUS.—Sow seeds of Schizanthus now to obtain plants for flowering next

spring. Sow thinly in pans or boxes, and keep the pans well shaded until the seed germinates. Gradually accustom the seedlings to full light, and grow them in cool conditions. Prick the seedlings out into 60-sized pots when sufficiently large to handle. *S. Wislizenensis* is excellent for flowering in pots, and hybrids in various shades are procurable. The same applies to *S. retusus*, of which seed is offered in great variety, from pure white and yellow to rosy pink. Schizanthuses are excellent plants for the amateur grower, as they are kept quite cool from the seedling to the flowering stage. They are valuable for cutting, as well as for decorative use in the conservatory.

HUMEA ELEGANS.—Seeds of *Humea elegans* should be sown now, to provide a succession of decorative plants. Young plants grown on from seed sown earlier in the season will now be growing freely, and should be potted on as required. Pot firmly, using a compost of three parts turf to loam to one each of leaf-soil and manure from a spent Mushroom-bed, adding a 6-inch potful of soot to a barrowful of the compost. Be careful not to bury the stem lower than it was in the previous pot. *Humeas* resent over-watering more quickly than most plants, often collapsing altogether if the roots are allowed to become too moist. They thrive best in a cool frame, standing on ashes, and require very little water during the winter. Fertilize liberally at intervals to keep the plants free from aphids.

THE FLOWER GARDEN.

By W. J. GUNN, Gardener to Mrs. DEMPSTER, Keele Hall, Staffordshire.

PROPAGATING STRUBS.—Many varieties of strubs may be propagated at the present time, if frame accommodation is limited, and spare lights are available, a temporary frame may be erected in a partially shaded position. The frame should be about 2 feet deep; place a thick layer of fine ashes in the bottom, and fill up the space with a sandy compost to within 12 inches of the glass. The bed should be made quite flat, and the half-timpened shoots (with a heel for preference) inserted very firmly. After watering the cuttings through a fine rose to settle the soil, tilt the lights a little for a few hours to dry the foliage. The frames must be kept quite close, only admitting sufficient air to dry the moisture after the usual sprayings on fine days. Apply a light shading during very bright weather, and gradually admit air directly root action commences.

HARDY FUCHSIAS. Hardy Fuchsias are now at their best. They thrive in light, sandy soil, but they are not exacting in this respect. In cold districts a little protection is necessary during winter, such as long litter or bracken placed round the base of the plants. To increase the stock, cuttings should be inserted at once in a cold frame, using a sandy compost. Protection is necessary for the young plants in frosty weather. The following is a selection of the best species and varieties: *condita*, *Ericaumont*, *Mme. Cornclison*, *gracilis* Thompsonii, and *soziniana* microphylla.

HELIANTHUS. The perennial Sunflowers are useful for decorative purposes. The flowers of the variety Miss Melish last a considerable time in water. The variety Miss Willmott is also very fine, the deep golden-yellow flowers and nearly black centre showing up well in the herbaceous borders. The small double yellow flowering variety Solid Four is very free in flowering, and useful for cutting. The best results are obtained from this variety when it is grown in rich soil. If the faded flowers are continually removed a succession can be obtained from the side-shoots. Keep the plants neatly staked and tied to prevent damage by wind.

EREMURUS. Plants of *Eremurus* should not be lifted unless the young shoots are over-crowded. In such cases the plants must be lifted, pulled apart, and replanted at once in a rich, porous loam. Well-decayed manure or leaf-mould mixed with the soil is beneficial.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher. — Our correspondents to avoid obtruse delay in obtaining answers to their communications should state as much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Special Notice to Correspondents. — The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, SEPTEMBER 25—

Royal Horticultural Soc. Coms. meet and special Vegetable Classes.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 55.2.

ACTUAL TEMPERATURE—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, September 20, 10 a.m. Bar, 29.5; temp, 60.5; Weather, Fine.

SALES FOR THE ENSUING WEEK.

MONDAY AND FRIDAY—

Narcissus, Tulips, Anemones, &c., at 67 and 68, Chesapeake, by Protheroe & Morris, at 1 o'clock.

WEDNESDAY

Trade Sale of Home-grown Bulbs at 67 and 68, Chesapeake, by Protheroe & Morris, at 1 o'clock.

The Rose season of 1917 has been an extraordinary one. The winter was severe and prolonged.

The Rose Season.

Only in May did the weather suddenly alter to something like summer. June, however, was fine and warm, and Roses, though very late in starting into growth, developed vigorously, and, contrary to expectations, their flowering season began decidedly earlier than in most years. The blooms, when they appeared, seemed both finer and cleaner than usual, notwithstanding the fact that most growers were obliged to restrict, or even dispense with, the usual spring dressing of manure. Even the shows followed the usual character of the year. There was no metropolitan summer show of the National Rose Society, and very few exhibitions in the provinces. The National Rose Society managed, however, to get together a very fair autumn exhibition on September 11, as well as a display of seedlings at the Royal Horticultural Society's meeting on July 17.

The severity of the winter caused many Rose-growers to fear for the safety of their plants, more especially of those which had been transplanted, or newly purchased. In the North and Midlands many losses occurred, the most serious, because the most noticeable, being among the rambling Roses having a preponderance of Tea blood, such as Francois Juranville and Joseph

Lamy. Some at least of these had most of their top growth affected, and in some cases they were cut to the ground level, though we believe few were killed outright. In the London district and southwards no serious casualties resulted.

"White Rose" tells us that in his garden, a few miles from London, only some of the tips of the ramblers were affected by the frost, with the exception of a pillar specimen of Silver Moon, which flowered poorly, and has since died. Another pillar of Ards Rover, though not so badly affected, failed to make any new growth from the branches, but is throwing up good new growth from the base. Among garden Roses other than climbers, the chief sufferers have been standards, and those, for the most part, plants which were previously not in the best of health. With these exceptions, even the standards came through the ordeal of the severe winter fairly well, and the only plants previously in good condition which have been injured are a few standards of the variety Madame Hoste, all upwards of ten years old.

Among the dwarf Roses, it is only in cases where there was some disease in the previous summer that any serious disaster has occurred. Thus a bed of Mme. Abel Chatenay that had suffered from black spot, and another of Dr Campbell Hall that had been affected with rust in the summer of 1916, have both done so badly that they will require to be replaced; but otherwise there is little to complain of.

It is most cheering to find that the variety Mme. E. Herriot has proved so hardy. We had felt doubts as to the hardiness of M. Pernet Ducher's new varieties, and feared that a very cold winter might clear them out of our gardens. These doubts have proved quite groundless in the case of Mme. E. Herriot, for not even the tips of the shoots were touched, and Louise Catherine Breslau seems equally satisfactory. Rayon d'Or had all the last year's wood destroyed, but shot up well from the old wood, and is now none the worse. Arthur R. Goodwin was rather cut by the cold, but most of the plants are recovering fairly well; none was actually destroyed, but a few have failed to grow as well as could be wished, and may have to be replaced this autumn.

Pruning was certainly difficult this year, and although it was carried out by cutting back rather harder than usual, there were many instances in which later in the summer shoots which had grown to some extent died back, indicating that a piece of frosted wood had been overlooked.

The warm weather of May and June brought on the young growths with great rapidity, and the early blooms of most of the H.T.'s and Teas were exceptionally good. This illustrates an observation of the late Mr. Mawley, that, provided June is fine, the weather during the rest of the year is of comparatively little importance to the summer blossoming of Roses. An exception to this satisfactory state of things was the colour of the crimson H.T.'s, which, save in the

cases of Mrs. Edward Powell and Red Letter Day, was extremely poor, and the old Hybrid Perpetuals were the only kinds which gave crimson flowers of any tolerable colour. Richmond, General McArthur, Liberty, Dora Van Tets, and even Avoca, were all more or less affected by the hot sun, and came with that unsatisfactory tinge of bluish-pink in the crimson which we are accustomed to associate with the August flowers. Few rosarians in hot countries have a good word to say for Richmond, which in a normal year is so charming in its first and again in its autumnal flowering. To compensate partly for this, there were lovely flowers of Victor Hugo, Horace Vernet, and Hugh Dickson, and twice in the year, early July and again in September, the garden gave us beautiful flowers of Edward Bohane. This is undoubtedly a fine Rose, but it is to be hoped that older plants will prove more free in flowering than young ones. National Emblem has given good crimson flowers, but the habit is too spreading to display them to advantage. Augustus Hartmann has, on the whole, done well as a bedding Rose; the colour is bright and attractive, an important point in a bedding Rose; the plants are generally in flower through the season, and are vigorous growers. Some of the plants of this variety succumbed to the severe winter, causing unfortunate gaps in the bed. A bed of Edith Part, however, planted at the same time, showed no gaps. This is a bicolor Rose of rose colour on the face and creamy flesh on the reverse of the petals, which are characteristically crimped at the edges. It is free and continuous in flowering, but in its first year has produced too many poorly formed flowers to be altogether satisfactory, while its growth has not been quite vigorous enough for a bedding Rose. It will be allowed to remain for another year to amend its ways. If it does not, it will have to make way for a better variety.

Ophelia is altogether charming, and one of the most free in flowering in the garden. The growth is good, the flowers are carried well on their stalks, and nearly all the blossoms are well shaped.

Mrs. W. E. Vanderbilt has proved satisfactory. The colouring is pinkish-apricot, resembling a flower of Lady Mary Ward, but the growth is more vigorous, and seems up to the present to be less subject to disease. The blooms are rather larger, but not so prettily shaped as those of Lady Mary Ward, which is so lovely a Rose, when at its best, that we cannot help regretting that it is not more vigorous and disease-resisting.

The flowering season of the Wichuraiana and Multiflora Roses in 1917 may be characterised as good while it lasted, but it was rather short. The heavy rains and storms of August scattered the petals of all the early flowering climbers and much injured the blossoms of the later varieties. It proved an unfavourable season for the sweet-scented Evangeline, which may be classed among the later climbers, usually scenting the garden in July and August.

THE MARKET FRUIT GARDEN.

A WET SUMMER.

IN all but two divisions of the United Kingdom the rainfall of the three summer months, as recorded by the Meteorological Office, was considerably over average, the exceptions being North and West Scotland. In the south-east, my own division, the total was 11.65 inches, or a small fraction over 5 inches above average, the greatest excess shown for any division. Only in S.W. England and South Ireland were the totals greater, and in them the excess over average was much less. At my own station the total was 11.88 inches, nearly half of which, or 5.66 inches, was for August, when rain was measurable on 20 days. The effect of such a wet month, in which urgent work in fruit picking was going on, was deplorable. Hoeing was out of the question, even when other work did not prevent it, as the land was continuously in very wet condition. Consequently, weeds grew unchecked in orchards, which were in a worse condition in this connection than they had ever been before. As for the effects of the two violent gales of August, reference has been made to them previously. The sequel is a great quantity of Apples rotting and shrivelling in every place of shelter in which they could be stored. This refers not only to the Apples tucked up off the ground, but also to a large proportion of the gathered fruit, for the quick despatch of which not a quarter enough of empties were procurable. Moreover, the markets were so glutted with windfalls that prices fell to a very low level. The wet weather of the latter part of August, as well as the gales, caused a great loss in Plums also, and the markets for that fruit too were overdone with supplies, much of which consisted of over-ripe and partly rotten fruit. Altogether, the early part of the tree fruit season has been one of the most worry-
ing times that growers have known.

A SPOT DISEASE OF APPLES.

In the annual report of the Research Station at Long Ashton, Bristol, for 1916, recently received, Mr. G. T. Spinks, returns to this subject, first noticed in the report for 1914. The spots appear around the "lentil-like" structures which occur in the skin of Apples. At first they are so minute that they can be seen only with the aid of a lens; but the spots grow, sometimes before the fruit is gathered, but more commonly after it has been stored, until they become quite large in some cases, and even meet each other. Incubations with cultures of seven different fungi have caused the formation of spots, a result so curious that it seems to indicate that the original cause of the rotting was a minute puncture by an insect, followed by the introduction of one of many fungi which cause rotting. The summing up of the information acquired at present is as follows:—The fungus enters the Apple through a "lentil" some time before the first sign of a spot appears, but the actual time of entry is not known. It may be after the Apple is gathered or before, or even when the "lentil" is first formed. The fungus for a time makes very little growth, and only produces a noticeable spot when the Apple has reached a suitable state of ripeness. The spot then grows rapidly. In November and December Apples, as a rule, can only be infested through injuries, and not through uninjured "lentils."

As in some previous recent seasons, I have found a good deal of this rot spotting among a few varieties of Apples. In packing a remarkably fine lot of Worcester Pearmain, many hundreds, if not some thousands, of Apples, including some of the finest, have had to be thrown out as unmarketable. In a large proportion of instances there was only one rot spot on an Apple, but even biggers who will buy the smallest of dessert Apples readily

shall be clearly stated on each ear, box, bale, or other container, which shall also bear a declaration of the nature of the contents. All shipments made in accordance with these regulations will be entirely at the risk of the shippers or consignees. Under Regulation 7, the importation of all Currants and Gooseberry plants, and European Potatoes, is prohibited. The importation of all nursery stock, including trees, shrubs, plants, vines, grafts, scions, cuttings or buds through the mails, is prohibited, except greenhouse-grown florists' stock, cut flowers, herbaceous perennials and bedding plants, which will be admitted provided that a certified declaration of the contents is attached to such parcels.

CORY CUP FOR DAHLIAS AT R.H.S. SHOW.—We are informed by the Royal Horticultural Society that at the meeting of the Society held on September 11 the judges placed Messrs. CARTER PAGE & Co. first in the Dahlia Competition for the Cory Cup. Messrs. CARTER PAGE & Co. having, however, won the cup in 1916, and the same winner being only eligible to compete in three years, the cup was awarded to Messrs. J. CHEAL & SONS, and a special award of a Silver gilt Flora Medal was granted by the Council to Messrs. CARTER PAGE & Co.

WAR ITEMS—Captain CHARLES DIGOY, of the 14th Regiment of French Infantry, who, we are informed, has been killed in the war, lived for a time in England, working in Kew Gardens. He died up as a sergeant on the outbreak of war, was wounded several times, and mentioned five times in Army Orders. Although only 27 years of age Captain Digooy had been awarded the Cross of St. Anne of Russia, besides being a member of the Legion of Honour.

—M. ALFRED NOMBLOT, secretary of the National Horticultural Society of France, who has been at the front since the beginning of the war and has been wounded, has recently been promoted to the rank of lieutenant colonel.

—M. LOUIS PISCOTET, son of M. PISCOTET GUYENON, of Tours, after being incapacitated for service in the infantry, joined the Air Service, and has recently been mentioned in Army Orders for bravery in face of enemy aviators.

BORDEAUX MIXTURE VERSUS LIME SULPHUR FOR POTATOES. The latest comparative tests* of Bordeaux mixture and lime sulphur for Potato spraying show the marked superiority of the former specific. Whereas Bordeaux mixture gave an increased yield as compared with the control plot of 63.6 bushels of marketable tubers per acre, lime sulphur resulted in a decreased crop of 25.3 bushels.

NEW ZEALAND GRAPE INDUSTRY.—It appears from a report by the United States Consul General at Auckland that Grapes are not grown very successfully in the open in New Zealand, since the climate is too moist and cool to allow the fruit fully to mature. There are about 390 acres of vineyards under cultivation, located in the most favourable spots of the Dominion, where limited quantities of middle-quality Grapes have been grown; but the Grape is not considered a very profitable crop. During the year 1915 there were 89,800 gallons of wine manufactured in New Zealand. The vineyard Grapes retail at from 4d. to 6d. per lb. Some excellent table Grapes are grown in the Dominion, but in vine houses instead of in the open air. There are about 800 of these vine houses, and all seem to be doing a thriving business, especially in the South Island, where practically no Grapes are grown in the open. Grapes grown under glass retail in New Zealand for 1s. 6d. to 2s. per lb., and find a ready market.

PUBLICATIONS RECEIVED. *Pig Keeping in War Time*, by C. J. Davies. (London: Geo. Newnes, Ltd.) Price 7d. net.—*The Effect of One Plant on Another*, by Spencer Pickering. (Reprint from *Annals of Botany*, April, 1917.)

* Bull. No. 428, New York Agric. Exp. Station, Geneva, N.Y.

The last half of the Rose season has, in fact, been a good test for Roses that will stand rain in the garden. Mrs. Edward Powell and Mrs. E. G. Hill have come through the test better than most. Madame Ravary and Red Letter Day have also done well, so have Mr. Pemberton's Moonlight and Mrs. Herbert Stevens, while Mme. Léon Pain, though slightly affected by wet, recovers so quickly and flowers so freely that it may almost be classed with "rain-proof" Roses.

Alexander Hill Gray is still the best bedding Tea of recent introduction, though Lady Plymouth is a first-rate variety in fine weather. A pretty little Rose somewhere between the Teas and the Chinas, called Rosomane Narcisse Thomas, may almost be added to this class. It has admirable foliage, and is a vigorous grower. The flowers are small, of a pleasing pinkish apricot colour.

ROYAL VISITORS AT FRIAR PARK. Their Majesties the KING and QUEEN have recently visited Friar Park, the beautiful estate of Sir FRANK and Lady CRISP at Henley-on-Thames, making a tour of the grounds, in which they were much interested.

DAHLIA "REV. JOHN HAMLET."—Mr. REGINALD CORY writes us as follows in regard to this charming new Dahlia: "You record in your last issue that an Award of Merit has been awarded to my Dahlia Rayon la Rouge, which, indeed, was the case, and which happened through the labels of the two varieties I sent up getting changed. The name of the one which received the award is the Rev. John Hamlet. I spoke to the officials of the Royal Horticultural Society on the matter, which was thereupon adjusted, and the variety Rev. John Hamlet has been duly entered in the books as having received the Award of Merit."

PARIS CHRYSANTHEMUM SHOW.—The National Horticultural Society of France will hold an exhibition of Chrysanthemums on November 8 next.

CANNED PINEAPPLES FROM QUEENSLAND.—According to a Queensland journal a shipment of 10,000 cases of canned Pineapples has been despatched to this country from Queensland. This is the second large shipment during recent weeks, and it was despatched from the various canneries in and around Brisbane. The canned fruit is for the use of troops in England and on the Western Front. The cases were subjected to a careful and close investigation by the officers of the Queensland Department of Agriculture, and the fruit found to be of excellent quality. Thousands of acres are available in Queensland for the culture of Pineapples, and a big trade in them should be built up after the war.

EXPORT OF NURSERY STOCK TO CANADA.—A number of the Regulations under the Canadian Destructive Insect and Pest Act have been recently amended and some of the changes will affect English nurserymen exporting trees and plants to Canada. Regulation 4 requires that a declaration of the nature of the contents of shipments of nursery stock subject to fumigation or inspection shall be attached to the container. Nursery stock subject to fumigation or inspection shall not be included in cars, boxes, bales, or other containers with plants that are exempt from fumigation or inspection, but shall be shipped in separate containers. The port by which it is intended that nursery stock subject to fumigation or inspection shall enter Canada

enough at very low prices, do not care to take rot-spotted fruit. In some cases the rot spot is found in the eye of the Apple, but much less commonly than in some other part of the fruit. It seems to me that the disease named "eye rot," first noticed extensively in Worcester Pearmain, particularly two years ago, is the same as the rot spotting of other parts of an Apple. In some cases there are rot spots in the eyes and on one of the sides of the same fruits, and no difference in the appearance of the spots is noticeable. In the Long Ashton Report for 1914, Professor Baker suggested that the fungus causing rot spots obtained entry through cork spots in the skins of Apples, and such cork spots are likely to be found in or close to the eyes as in other parts of the fruits. No preventive or remedy for this wasteful malady has been even suggested hitherto. *Southern Grower*.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

NOVELTIES IN CLIMBING AND PILLAR ROSES (see p. 95).—I note that Mr. Easlea is not yet satisfied as to what is truly a climbing Rose. In the same way the terms "bush Rose" and "pillar Rose" are somewhat confusing. As no definite rule exists, I conclude that it is a matter of personal opinion. In the case of climbers, I trust that varieties which run up 12 feet high and in a few years bear only a few blossoms on the top of the support will not be included. The Wehrhahn section yields the best of climbing Roses, varieties that produce growth in such a manner that the support is clothed from the base to summit with foliage and blossoms. The Rev. J. H. Pemberton describes Madame Alfred Carrière as a bush. Here it grows as a climber, and it covers a wall 20 feet high. After several years' trial I find Dr. J. Van Fleet one of the best of climbers. It flowers here profusely in clusters of soft, pink, shapely blossoms. *E. Molyneux, Swanmore Farm, Bishops Cleeve*.

ROSA MOYESSII. Instead of propagating the best forms of this beautiful Chinese Rose by budding, as suggested on p. 106, I would suggest layering. With banded specimens a watch has always to be kept for suckers, and while their removal is comparatively easy in varieties that are pruned each season, suckers are not so easy to detect or remove in free, natural grown bushes of the Rose species. *J. O.*

CONTROL OF SLUGS. In your last issue Dr. Durham, writing on p. 103, in respect of slugs, states: "Now that I know more about controlling this pest," I should be grateful if he would impart this knowledge through the medium of your pages, and probably there are others who would rejoice to hear of any successful method of dealing with slugs. I caught 5,000 in my garden this spring by hand, or rather with an iron spoon, and dropped them into a small tin containing some paraffin. I have tried various soil fumigants, but I confess that up to now the slugs have the upper hand. *A. H. Pearson.*

DEGENERATION IN POTATOS. (see p. 100). I am a doubting Thomas regarding this. I see no reason why, given good treatment, a Potato should not go on for ever. I have had the pleasure recently of accompanying Mr. John Small, of the Board of Agriculture, in a visit to the Lothians and Dumfriess, and we had many opportunities of comparing notes. Mr. Small told me that in his work in Lancashire he had this season come across some fields of Potatoes which behaved very badly at the start. He made as full an inquiry as possible, and came to the conclusion that this arose from the seed tubers having been badly kept. In fact, he came to the conclusion that the sets had been chilled, i.e., had been so nearly frozen as possible without being actually frozen. He asked me if I had any similar experience. I said yes. This spring the

shovest tubers to start were some pedigree seedlings which ought to have been the strongest of all. I found the boxes containing them had been kept all through the winter in a store, next to an outside north wall, where they would several times be on the verge of freezing. Thus our experiences seemed to tally. At Dumfriess town on our tour we met Mr. McAlister, of Potato fame, and together drove out to Finghall, to see Sir Matthew Wallace, who grows over 200 acres of Early Potatoes for seed. In the course of conversation Sir Matthew told us he had been puzzled this last spring by the behaviour of some of his fields of Potatoes. The plants in these fields began to grow very badly, and I looked for a few weeks as though the crop would be a failure but they ultimately picked up. He made a searching inquiry, and found that the "seed" they were planted with had been stored in a building which was the least secure from frost of any of his buildings, and he had come to the conclusion that the "seed" had been "chilled." This was rather remarkable confirmation from so great an authority. I think the Witley authorities ought to make a searching inquiry into the conditions under which the tubers of Malsham Early were stored; and may I appeal to others to give growers, through your columns, the benefit of their observations if they have had similar experiences? *W. Cuthbertson, Duddington.*

BULBS.—The prohibition of the importation of bulbs during the war has caused growers at home to give more attention to their cultivation. The development of the Narcissus is now cultivated, in its endless variety of form and tint, should encourage those taking up the cultivation of other classes of bulbs. Home-grown bulbs of this class are better than imported ones, and are said to force with greater certainty. So great is the quantity now in this country that the best decorative varieties are sometimes offered in bags of 500 and 1,000, and find ready purchasers. Tulips are now also grown well in the British Isles. Cottage and Darwin Tulips are the kinds principally grown. The early forcing varieties have yet to be successfully handled in quantity by English growers. The British Tulips so far fall mainly in the appearance of the bulb, but the rougher skin does not interfere with the production of good flowers. The Hyacinth seems to be the most difficult subject for home cultivation. Some large dealers declare that we shall never approach the Dutch product either in quality or price. It is probably a question of finding the right soil, situation, and method, rather than of climate conditions. Gladioli can be grown well in the British Isles and Channel Islands, and there seems to be no reason why they should not be produced at home in sufficient quantities. The question of after-the-war trade is needing much attention, and it should not be difficult to provide for an extensive development of the British bulb trade. *James O'Brien, Harrow-on-the-Hill.*

POTATO SPRAYING. Much useful information might be gathered if growers would give the results of spraying Potatoes this year. In this neighbourhood no benefit is apparent. The local society sprayed many of the allotments, yet the disease spread rapidly through the plants, both sprayed and unsprayed. In private gardens where there were not unsprayed Potatoes, the effect was the same. One grower I know sprayed his crop three times, yet his Potatoes were as badly affected with disease as others. I sprayed twice, making the wash from fresh materials, and doing the work myself. I also washed my seed Potatoes with clear water, then sprouted them, and sprayed them with Bordeaux mixture after sprouting and before planting. Yet it all seems to have been in vain. The only green haulm I have at this date, August 30, is on a vast row of Supreme, whilst the foliage of Potatoes had generally withered. Both varieties had precisely similar treatment, and were fresh "seed" bought from the same source. This strengthens the belief that relief from the deadly blight is more likely to be found in resistant varieties than in chemical washes. *William J. Harford, Ashurst Lodge Gardens, Sunninghill.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

SEPTEMBER 11.—*Present:* Mr. E. A. Bowles, M.A. (in the chair), Messrs. W. Hales, W. Fawcett, G. Baker, E. J. Allard and F. J. Chittenden (hon. sec.).

Tachycarpus acedius fruiting.—Mr. Cory sent from his garden at Duffryn a fruiting shoot of this hardy Palm.

Rust on Black Currant.—Mrs. Shaw sent from Kentschurch Court, Hereford, foliage of Red and Black Currants bearing the teliospores of the rust fungus *Cronartium ribicola*. This fungus is very prevalent this year and does great damage to young plants of the five-leaved Pines, and especially to *Pinus Strobus*.

SCOTTISH HORTICULTURAL.

SEPTEMBER 4.—The monthly meeting of the Scottish Horticultural Association was held on the 4th inst.; Mr. Phillips, the president, occupied the chair.

A paper by Mr. Charles Webster, Gordon Castle Gardens, Forchabers, on "Hardy Fruits," was read by the secretary. Mr. Webster said that there was no reason why we should not be self-supporting in some of our home-grown fruits, especially Apples. Although our uncertain climate might militate against the production of the fine colour of the imported fruit, culinary Apples could be grown superior to those which were imported. The larger part of the paper dealt with details of cultivation.

The exhibits were: Collection of Apples, Plums and Apricots, from Mr. WEBSTER (awarded a Silver Medal); collection of Apples, Plums and Pears, from Mr. R. STRAWARD, Panshanger Gardens, Hereford (awarded a Cultural Certificate); Tomatoes, from Miss BURTON, New Saughton Hall, Polton (awarded a Cultural Certificate); collection of Dahlias, from Messrs. DOBBIE AND CO.; seedling Single Chrysanthemum, from Mr. A. Innes, Dean Cemetery, Edinburgh. A Certificate of Merit was awarded to a new Peach, Lord Desborough, exhibited by Mr. STRAWARD; a First class Certificate to dwarf Collette Dablia Lona; and Certificate of Merit to Collette Dablia Mountaineer and Gaillardia, exhibited by Messrs. LEITCH AND CO.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

SEPTEMBER 5, 6.—The annual show of the Glasgow and West of Scotland Horticultural Association was held in the St. Andrew's Halls, Glasgow. The number of entries was almost as large as last year, when a sum of £750 was then raised in aid of the Red Cross funds. A similar sale took place this year, and it is hoped that the profits will exceed those of 1916. The quality of the exhibits was fully equal to that of any previous year, and the displays of fruit and vegetables—grown for the most part by amateurs—were of the highest excellence.

FRUIT.—For a collection of 12 dishes of fruit the 1st Prize was awarded to the Rt. Hon. A. J. BALFOUR, M.P., Whittinghame, East Lothian (gr. Mr. Geo. Anderson), for superbly grown produce. 2nd, ERNEST BEWLEY, Esq., Rathgar, Co. Dublin (gr. Mr. D. McIntosh). The Thomson Challenge Trophy for eight bunches of Grapes was won by WM. MCKAY, Esq., Acoig, Rothaysay (gr. Mr. David Holliday), who was successful last year. JOHN G. THOMSON, Esq., Norwood Alloa (gr. Mr. James Small) and Lord ERINSMORE were the other successful winners, in the order named. Mr. MCKAY was also placed first for the best exhibit of four bunches of Grapes. ERNEST BEWLEY, Esq., exhibited the best collections of Apples and Pears.

VEGETABLES. In the principal class for vegetables the Earl of HOWE, K.T., Bothwell Castle, Bothwell (gr. Mr. W. P. Bell), was placed 1st.

followed by Mr. JOSEPH DEVOY, Stranraer. The entries in the vegetable classes were unusually numerous, and so even was the produce that the judges experienced considerable difficulty in placing their awards. The Earl of Howe and Mr. JOSEPH DEVOY were the principal winners in the other classes. There were numerous classes for pot plants and cut flowers.

The following awards were made to honorary exhibits: *Gold Medals*—Messrs. AUSTIN AND McCASLAN, Messrs. BLACKMORE AND LANGDON, Messrs. SUTTON AND SONS, Mr. WM. LEIGHTON, Messrs. STORRIE AND STORRIE. *Silver Medal*—Mr. JOHN FORBES. A First-class Certificate was awarded to Mr. JOHN SMELLIE for a seedling Sweet Pea named Private Jack Smellie. It is an improved form of Rosabelle.

WOODFORD HORTICULTURAL.

August 25.—On Thursday, August 25, the Woodford Horticultural Society held their forty-fifth annual exhibition. There were numerous exhibits, and the show was attended by many visitors. As in the case of most shows this year, prominence was given to exhibits of vegetables, but there were also horticultural groups, including a fine display of Roses (not for competition) sent by Messrs. CHAPLIN BROS., Waltham Cross.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

SEPTEMBER 6. *Committee present:* Rev. J. Crombholme (in the chair), Messrs. D. A. Cowan, J. C. Cowan, J. Cypher, P. Foster, A. R. Handley, J. Howes, A. Keeling, D. McLeod, F. K. Sander, W. Shackleton, H. Thorp, and H. Arthur (secretary).

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya Veana, var. *Princess Mary*, a large, well-formed flower of good colour and with a brightly coloured lip; from W. R. LEE, Esq.

AWARDS OF MERIT.

Cattleya Prince John, var. *Dorothy Sharp* (*Hardyana* var. \times *aurea*), and *C. Thiba*, var. *Rev. J. Crombholme* (*Adula* \times *aurea*), from Messrs. SANDER AND SONS.

C. Nihil, var. *Reine de Saba*, from R. ASH WORTH, Esq.

The *Odontoglossum* exhibited at the last meeting by J. J. Bolton, Esq., and which received an Award of Merit, should read *Vaha*, and not *Zulu*, as was stated in the report.

CULTURAL CERTIFICATES.

A First-class Cultural Certificate was awarded to Mr. E. ROGERS, for three plants of *Panda coccinea*, each carrying two spikes of well-coloured flowers, and to Mr. C. BRANCH, for *Odontoglossum crispum Etna*, carrying three spikes; *Cattleya Harrisoni alba*, with seven large flowers; and *C. Veana*, var. *Princess Mary*.

A Second-class Cultural Certificate was awarded to Mr. DAVENPORT, for *Bulbophyllum barbigerrum* and *Mastocallis muscosa*.

VEGETABLE SHOW AT SOUTHEAD.

SEPTEMBER 14, 15.—An exhibition was held in the High School, Southend, on the 14th and 15th inst., under the auspices of the local Food Production Society. The show was a magnificent demonstration of the success of local efforts to increase food production in and round this well-known seaside resort. By far the greater number of exhibits staged in the classes consisted of vegetables from the allotment gardens of Southend and its suburbs, and the display was an exceptionally good one, showing the result of skilful cultivation. There were several domestic classes, for bread, pies, wartime cakes, non-intoxicating beverages, rabbits, etc. The exhibits of vegetables filled the greater part of the spare in the large School Hall and two other rooms, as well as the lobby of the building. The moving spirit of the show

was Mr. G. E. Tinley, and the excellence of the arrangements was due to him. During the afternoon of the opening day, Mr. W. H. DIVERS gave a lecture on Food Production, and a lady representative of the Food Production Department gave demonstrations on fruit bottling during the two days. The vegetables were first-rate, and there was an absence of the coarseness which so often characterises the produce at local shows. Owing to the liberality of tradesmen and others the prizes were sufficient to attract keen competition. Many famous exhibitors would be proud to have grown some of the Potatoes staged. One dish of King Edward was especially fine in size, form and colour. Beet, Parsnips, Carrots, Tomatos and Marrows were splendid, but Onions were a little below the average of exhibition quality, while, owing to the plague of caterpillars in the neighbourhood, Cabbages, Savoys, and other greens were sparingly shown.

VEGETABLE SHOW AT BRENTFORD.

SEPTEMBER 15.—A somewhat unique exhibition was held in the Rothschild Schools, Brentford, on Saturday, the 15th inst., when the members of the Brentford Allotment Association held their first show of vegetables. A schedule of

the late Sergt. F. J. King, Lance-Corporal W. J. Eagle, Privates W. L. Crook, F. Hills, C. Bowden, H. R. Castle and A. V. Waldoek, and the sum of £265 9s. 3d. was passed for payment to their respective nominees. The sick pay for the month was £45 lbs. 11d. (ordinary). The special general meeting respecting the proposed Juvenile section will be held in the R.A.S. Hall on October 8.

Obituary.

JOHN PHILLIPS.—We learn with regret that Mr. John Phillips, nurseryman, Granton Road, Nin-series, Edinburgh, died on the 14th inst., after an illness of only five days' duration. Mr. Phillips was born in 1853 at Ross Priory, on the side of Loch Lemond, Dumfriesshire, where his father was head gardener, and it was there that he commenced his gardening career. After a time he moved southwards, and for a time he served under the late Mr. Barron at Chiswick, and while in the London district he had charge of the laying-out of the grounds at the White Lodge, the residence of the late Duke of Teck. He afterwards spent some time in Birmingham, and, returning northwards, was given charge of the glass department of the late firm of Ireland and Thomson, at Edinburgh. About thirty years ago he took over from this firm the glass-houses and adjoining ground at Granton Road, formerly part of the area occupied by the Lawson Seed and Nursery Company, Ltd., and there he carried on an extensive market nursery business. Mr. Phillips took much interest in the affairs of two horticultural societies which have their head quarters in Edinburgh the Royal Caledonian Horticultural Society and the Scottish Horticultural Association, in both of which he held office as a councillor. In January of this year he was, with unanimous approval, elected president of the Scottish Horticultural Association, and it may be mentioned that during the forty years of its existence this is the first occasion on which a president of the Association has died whilst in office. Deceased was also a member of the Royal Scottish Arboricultural Society, the Nursery Trades' Association, and the Edinburgh Market Gardeners' Association. He was a frequent visitor to the Ghent and other exhibitions, and he was one of the party of the Nursery Trades Association which visited Germany on the eve of the outbreak of war. To the objects of the Association of which he was president, he was a liberal contributor, and to those of a charitable kind he rarely resisted an appeal. Mr. Phillips left a widow, three sons, all of whom are serving in the Army, and one daughter. His second son, Mr. Malcolm Phillips, is following the business of his father. The funeral took place at Comely Bank Cemetery, Edinburgh, and was attended by office-bearers and members of the horticultural societies, and other horticultural friends.

THE LATE MR. JOHN PHILLIPS, PRESIDENT OF THE SCOTTISH HORTICULTURAL ASSOCIATION.

thirty-five classes was arranged, and in not one of the classes was a prize offered. The lack of encouragement in this direction did not, however, deter the members from staging their best produce, with the result that a capital exhibition of food material, chiefly from war-time gardens, was provided. This interesting and educational exhibition was due to the initiative of Mr. CHAS. H. CURTIS, who recently became the chairman of the Association, and his enthusiasm inspired the rest of the members to exhibit without the incentive of prizes. The show was judged by Mr. Bates, of Syon House Gardens, and Mr. Pooley, formerly of Syon. Onions, Potatoes, Beet, Carrots, Runner Beans, Marrows for table use and Marrows for winter use, were shown in first-rate style.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

SEPTEMBER 20.—At the meeting on this date three members were elected. Two members were allowed to withdraw interest amounting to £5 14s. 6d., and two members were allowed to withdraw from their deposit sums amounting to £3 9s. 5d. The Army forms were received of

JOHN A. SIMPSON. We regret to announce the death, from heart failure, on the 10th inst., of Mr. John Alexander Simpson, for thirty years in the service of Messrs. Dobbin and Co., Edinburgh. He was an apprentice when the firm was at Robbessay, and became the manager of the seed department at a comparatively early age. Deceased was in his 44th year.

TRADE NOTE.

Mr. C. H. Beck, nurseryman, Ipswich, Suffolk, is retiring from business owing to failing health.

GARDENING APPOINTMENT.

Mr. T. Hunter, for 5 years Gardener to C. C. W. Simpson, Esq., Langmuir, Broughton, Glasgow, to A. E. Tixer, Esq., Minto, Edinburgh, Liverpool.

CROPS AND STOCK ON THE HOME FARM.

PREPARING FOR WHEAT.

DIRECTLY the harvest is finished, next season's crops have to be prepared for. The best preparation for Wheat by way of a previous crop is Clover, not mixed with Italian Rye Grass or Bents, but pure. If the Clover crop was not eaten off by sheep, a good dressing of farmyard manure at the rate of 20 tons per acre should be applied.

Sheep-fed Rape, or Rape and Turnips, will prepare the way for excellent Wheat, perhaps of higher quality than that from a Clover ley. In this case added manure is not necessary, especially when cake is fed to the sheep. Mustard growing at least 2 feet high, ploughed in and firmly pressed, is another of the best of Wheat preparations, and an easy method to adopt where sheep are not kept, and where manure is scarce. Some feed off the Mustard to sheep, but it is not generally considered good food for sheep.

Potatoes provide another excellent preparation for Wheat, mainly owing to the manure left in the soil after the cultivation necessary for that crop.

Wheat also successfully follows Tares, Peas, and Beans.

Mangolds are perhaps the least desirable of crops to be followed by Wheat, owing to the greedy nature of the Mangold, and to the lateness of the removal of the crop, which sometimes delays the sowing of the Wheat until the middle or even the end of November.

Rotation grass leys are good; newly broken up pastures, too, are used with success, although wireworms are sometimes troublesome. Farmyard manure should be freely employed, or its equivalent in artificial manures.

Of all details in the cultivation of Wheat, none is more important than early sowing. From the third week in September until the end of October is the proper period to sow.

Push on as fast as possible all details for getting the seed-bed ready. Wheat sown later than the time above mentioned lies too long inert in the ground, owing to the cold conditions, especially if there is much rain. *E. Molyneux.*

FARMING SCHOLARSHIPS FOR WOMEN.

The Food Production Department is offering 15 Scholarships, tenable at South Eastern Agricultural College, Wye, Kent, for a combined practical and theoretical course in farming of about 22 weeks' duration. The Scholarships will cover the cost of maintenance and tuition. Preference will be given to candidates over 21 years of age who will be suitable for the positions of forewomen, under-bailiffs, and instructresses. Only women who have had considerable practical experience on the land and will undertake agricultural work for the duration of the war will be eligible. The course will commence early in October.

ANSWERS TO CORRESPONDENTS.

BECCOLI ROOTS CURLED: *W. E. P.* The trouble is probably due to injury by an insect at the root, which has set up a condition similar to that of galling. In the winter, dress the ground well with slaked lime, and do not plant Brassicas on it for at least a year.

BUTTERFLY: *J. E.* This is the small Tortoise-shell Butterfly, *Vanessa urticae*, one of the commonest in this country. The perfect insect appears in June, and often lives through the winter. With the exception of the common white butterfly, it is the only one which penetrates into the heart of London.

CATTLE DAMAGING AN ALLOTMENT: *W. J. C.* The owner of the cattle is liable to pay for the damage done to your crops. The cattle were trespassers, and the fact that they were able to stray upon the allotment shows negligence on the part of their owner in not keeping them under proper control or properly fenced in. If you have not already informed him that the damage has been done you should do so at once. As soon as the value of the damaged crops has been ascertained an application should be made to the owner of the cattle for payment of the amount, accompanied by an intimation that unless such

payment is made legal proceedings will be taken. With reference to your enquiry for a society for you to join, you should apply to the Secretary, War Agricultural Committee, Hertford, for further information.

CELERIAC: *H. E. D.* The first week in March is the best time to sow Celeriac, and if it suffers no check when young it should not prematurely run to flower. Liberal treatment should be given from the time the young seedlings appear. Though the plant is fairly hardy it is not improved by being left in the ground after severe weather sets in.

CLASSIFICATION OF FRUITS: *W. J.* Apples and Pears are termed hard fruits; soft fruits include Raspberries, strawberries, Currants and such like, whilst stone fruits—in relation to jam-making—are Cherries, Plums, Damsons, Bullaces and Apricots.

CLUB ROOT: *J. M. C.* See article on "Finger-and-Toe" on p. 118.

NAMES OF FRUITS: *J. M.* You send more than six fruits for naming, which is contrary to our rules. No. 7, Scarlet Pearmain; 8, not fully grown; 9, Scarlet Golden Pippin; 10, not fully grown; 11, Cellini; 12 and 13, Malster; 14, Grenadier. The Plums were crushed; they should not be packed with hard fruits like Apples and Pears.—*W. B. and S.* 30/1. Pitmain Duchesse; 3, Cox's Orange Pippin; 8, 17 and 6, too small, do not recognise; 7, Allington Pippin; 10, Doyenné du Bouschou; 9, Williams' Bon Chrétien; 20, Warner's

FIG. 43. PEAR AFFECTED WITH SCAB DISEASE.

King; 29, Tower of Glamis.—*E. W.* No. 1, Mabbott's Pearmain; 2, Deau's Codlin; 3, Scarlet Nonpareil; 4, Small's Admirable; 5, English Codlin; 6, Belle de Pontoise; 7, Northern Dumpling; 8, Golden Pippin.—*F. G. Mackereth.* No. 16, Pears Williams' Bon Chrétien; 14, Beurré Rance.—*W. E. J. Leicester.* Red fruit, Red Astrachan; green fruit, Duchess of Oldenburg.—*J. H. H.* 1, Sandringham; 2, Round Winter Nonesch; 3, James Grieve; 4, King of the Pippins; 5, Bess Pool.

NAMES OF PLANTS: *A. G.* The Purple-podded Bean.—*H. G. P.* 1, Polygonum japonicum; 2, *Veronica salicifolia*; 3, *Escallonia rubra*; 4, *Peruetia mucronata*; 5, *Sibcormia herbacea*; 6, *Sedum album*; 7, *Mesembryanthemum mutabile*.

OAKS MOSS-GROWN: *W. J. H.* It is probable that the raising of the ground to such a considerable extent on one side of the Oaks has led to the condition you describe, partly because the roots are now covered to so great a depth, and partly because the shut in position prevents the air from circulating round the stems of the trees and drying the moisture resulting from rain and dew. It would be well if you were to dig away the bank for a distance of a few

feet round the roots of the Oaks, and endeavour to manage so that the moisture descending the sloping bank passes into the stream a little distance away from the roots, instead of, as at present, being discharged directly on to them. This will both enable a little more air to circulate, and also do away with the excess of moisture at the roots.

OVA ON CURRANTS: *S. G. B.* These are the ova of one of the Lace Wing Flies (*Chrysopa*, sp.). The larvae, known as "aphis lions," do much good by devouring aphides and scale insects.

PEARS AND APPLES DISEASED: *W. H. P.* Both the Pears and Apples are badly affected by Scab disease (see fig. 43). The first symptom of the fungus is to be found in small, roundish, dark-coloured spots on the upper surface of the leaves; the disease develops on the leaves and stems, and attacks the fruits, with the results you have observed. Cut away all diseased shoots just below the point of the previous year's growth, and also older branches, if they also show signs of being affected. Gather all diseased fruits and carefully burn them, together with the shoots you have removed, as the fungus spreads very rapidly. This work should be done during the winter; then, in the spring, just when the leaf-buds begin to swell, but before they expand, spray the trees with full strength Bordeaux mixture. Spray again with half-strength Bordeaux mixture after the leaves have opened, and once again if there are signs of disease on the leaves. Keep a keen watch for the brown spots, and cut off and burn any shoots on which the leaves are thus disfigured.

POND WEED IN LILY POOL: *W. F. H.* Drain the pond, if possible, and rake out all the weed which can be got at without injuring the Water Lilies. If you cut the weed frequently, and drag out as much as possible, it can be kept down. You can, however, use copper sulphate at the rate of 1 lb. to 100,000 gallons of water without fear of injuring the Lilies, but do not break it into lumps smaller than a marble, and be careful to cut out all the weed possible before using it.

PRESERVING EDIBLE PODDED PEAS: *J. N. C.* The pods of these Peas may be salted down in the same manner as Runner Beans; the pods should not be too old when they are gathered, or they will be tough.

PRESERVING WALNUTS: *A. G.* Dig holes in the open ground, and sink Seakale pots up to the rims. Place a piece of slate at the bottom, to prevent worms getting into the pots. Fill the pots with Walnuts, and put on the lids. Another method is to keep the Walnuts in tubs or boxes buried in white sand.

RABBITS AND FRUIT TREES: *Miss A.* The most effective, safest, and least expensive method of preventing rabbits eating the bark of your fruit trees is to thrust into the ground, a few inches away from the stem, quite close together, short, twiggy Pea-stakes 1 foot high. Quickset hedge-trimmings would also do if the shoots were stiff enough. The twigs prevent the rabbits from getting near to the stem, and if they are occasionally sprinkled with cold tar it will do much to prevent the rabbits approaching the trees.

VEGETABLES UNDER GLASS: *H. W.* The most profitable vegetables for growing in cool houses during the winter and very early spring are as follows. Cauliflowers. These should be sown immediately. Suitable varieties are Early Forcing, Magnum Bonum, and Walcheren, coming into use in this order. Lettuce, both Cos and Cabbage, are useful; Superb White Cos, All-the-Year-Round, and Tom Thumb are suitable varieties. Sow at intervals of a fortnight during the next six weeks. Parsley is often scarce during the winter, and finds a ready market; seedling plants should be pricked out where they are to remain by the end of the present month.

MARKETS.

COVENT GARDEN, September 19.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots and their prices, including Aralia Sieboldii, Asparagus plumosus, and various ferns.

REMARKS. Erica gracilis and E. hybrid are being offered at reduced prices. Good quality plants are being sold in pots, 90s., and thimblepots. Chrysanthemums in pots are better in colour, but Asters in 80s. and boxes are at their best. Linnam longiflorum and L. laetum rubrum are also on sale.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers and their prices, including Asters, Arums, Chrysanthemums, and Gladiolus.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage and their prices, including Adiantum, Asparagus, and various ferns.

blooms on the market are Mme. Abel Chateaux, Melody, Liberty, Sultanet, and Ophele. Asters and Carnations are fairly plentiful. There is only a limited supply of Fibrous, Stephanotis, and Lily-of-the-Valley. Phyllostachys is arriving in first-class condition. Several varieties of Medionema Russos are on the market, including the large blue variety, Astré Anellus King George, which is selling well. Violets are arriving in excellent condition, but there is not much demand at present.

Vegetables: Average Wholesale Prices.

Table listing vegetables and their prices, including Artichokes, Beans, Carrots, and various leafy greens.

Fruit: Average Wholesale Prices.

Table listing fruit and their prices, including Apples, Grapes, Lemons, and various berries.

REMARKS. Apples, Pines, Pears, Damsons, Blackberries and Nuts are all plentiful. The market is well supplied with Peaches, and with Grapes of all varieties. Walnuts and Chestnuts are available in increasing quantities. English Tomatoes are not quite so plentiful, but Dutch and Channel Islands varieties are plentiful. Melons are almost in supply. All varieties of outdoor vegetables are plentiful. E. H. B., Covent Garden Market, September 19, 1917.

THE FLOWER-GROWER'S GUIDE.

This superb book should be on the shelves of everyone who loves flowers and cultivates them. Not only is it a complete guide to the making of a perfect flower garden, but it is a work of art without which no garden library is complete. It is in three volumes, beautifully bound, each volume containing full-colour illustrations, many of them exquisite reproductions in colour from Mr. Hamilton's paintings. Such a book makes winter evenings delightful.

Price £3 3s., postage 1s. 6d. Send for it.

THE LIBRARIAN, 41, Wellington Street, London, W.C. 2.

LAXTON BROTHERS, BEDFORD.

A menace to our Food.

THE "nibbling" of the millions of Rats and Mice means in the aggregate a huge food wastage. It is a patriotic duty to kill them.

"LIVERPOOL" VIRUS EXTERMINATES RATS AND MICE

Safe and sure. Harmless to human beings and domestic animals. No risk of an unhealthy disfigureable smut for the pests come out of their holes to die.

In tins prepared with bait; for Rats 2 G & 6 - for Mice 1 G. Of all Chemists. Full particulars from **EVANS, SON, LEICHER & WEBB LIMITED, 56, Hanover St., Liverpool.**

BLACK CURRANT BUD MITE.

Are your bushes free of this incurable pest? If not Plant **"SEABROOK'S BLACK"** Currant, the only proved mite resister.

This variety has also every other good quality, being the heaviest cropper and stoutest grower, producing large, firm berries.

Young Bushes 6 and 8/- per dozen.
W. SEABROOK & SONS,
Fruit Tree & Rose Nurseries, CHELMSFORD.

FLOWERING BULBS.

A large and comprehensive Stock of

Choice Home Grown Bulbs

Descriptive Catalogue Free.

DICKSONS (Limited)
Bulb Growers and Merchants,
CHESTER.

ORCHIDS,

Clean, well-grown and cheap; also Many Rare and Choice Varieties.
STOVE and GREENHOUSE PLANTS of ALL KINDS.

NOTES FROM A GALLOWAY GARDEN.—XI.*

THE war has caused horticulture to take such a utilitarian turn that one almost feels it frivolous to gossip about merely ornamental plants. With the flower-beds in front of Buckingham Palace devoted to the cultivation of Potatoes, an apology seems due from anybody who occupies a column with anything less momentous than the treatment of French Beans or the vicissitudes of the Onion crop. However, such matter is too high for me; and being unable to attain into it, I can but meander through the September borders.

They are very gay just now, and their gaiety is enhanced by Red Admiral butterflies in such flights as I never saw before. The chief attraction for them lies in the purple tassels of *Buddleia variabilis*, the late-flowering variety magnificent. Be the shrub in the near borders or far off in the woodland rides, these splendid insects find it out and revel on its sweets. The type is out of flower before they get on the wing, and it is a puzzle to know how they passed these autumn days before the late-flowering variety was first raised in the "himitses." The gardener may regard the presence of these butterflies with equanimity, for their caterpillars, like those of their kinsman the Peacock butterflies, feed exclusively on Nettles.

Several years ago a plant arrived here under the name of *Aconitum volubile*, appropriate enough, for it is a vigorous climber; but in the *Kew Hand-List* that name appears as a synonym of *A. meibotium*. In the *Kew list* of new plants for 1908 it is entered as *A. volubile latisetum*, but in the list for 1909 it is stated that the correct name is *A. Vilmorinii*. It is a decided acquisition, climbing to a height of 10 feet and producing clusters of flowers in autumn varying in colour from dark

to light blue. The stems are herbaceous; it is perfectly hardy, and ripens plenty of seed. It possesses one peculiarity: It is well known that the great majority of climbing plants (as distinguished from those which climb by tendrils, sensitive petioles or rootlets) turn away from the sun, that is, from left to right as you view them. Of such are *Convolvulus*, *Wistaria*, *Berberidopsis*, *Stephanotis* and *Aristolochia*. The Hop, the *Lapageria*, and a few others turn with the sun, from right to left. In all these cases, the plant never varies from the hereditary habit. *Aconitum Vilmorinii* is one of the very few climbers that twine both ways. I have to-day examined one of several plants that all show the same indifference to direction. It has risen to the height of 8 feet on climbing *Caroline Testout Rose*, and, as that is the full height of its support, it cannot get any higher, and is just coming into profuse bloom. The first two turns of the main stem are against the sun, from right to left; the next five are from left to right, then follows a straight internode, after which come two turns from right to left, and the spiral finishes with one turn from left to right.

Turning up Darwin's *Climbing Plants*, I find he paid considerable attention to this matter, and found only three plants to behave in this abnormal manner:

"*Solanum dulcamara* revolves and twines in two directions; this plant, however, is a most feeble twiner. *Loasa aurantiaca* offers a much more curious case. I raised seventeen plants; of these, eight revolved in opposition to the sun and ascended from left to right, five followed the sun and ascended from right to left, and four revolved and twined first in one direction, and then reversed their course. . . . Another plant in the same family, *Scyphanthus elegans*, habitually twines in the same manner. I raised many plants of it, and the stems all took one turn, or occasionally two or even three turns, in one direction, and then, ascending for a short space straight, reversed their course and took one or two turns in an opposite direction. The reversal of the curvature occurred at any point in the stem, even in the middle of an internode. Had I not seen this case, I should have thought its occurrence most improbable." (*Climbing Plants*, p. 31.)

Both the plants observed by Darwin belonged to the order Loasaceæ; it is interesting to find a member of the Ranunculaceæ behaving in the same manner.

Judging from the generality of gardens, the merit of late-flowering species of *Wolfsbane* or *Aconite* for autumn display has not been fully recognised. A japonicum, 6 feet high, with deep blue flowers on branching sprays, passes with August; but its place may be taken by the Chinese *A. Wilsonii*, whereof the blue has a purplish tinge, and the North American *A. Fischeri*, bright light blue, contrasting admirably with the gold of *Hypericum Hookerianum*.

A problem in the effect of latitude on vegetation presents itself. *Euryphia*

cordifolia (see fig. 14) is a beautiful object here just now (September 21), sheathed with chalk white blossoms, each with a dense ring of terra-cotta anthers. It is in exactly the same stage to-day that I saw one in at Abbotsbury on August 26—just four weeks ago. Similarly, *Clerodendron trichotomum* was in full bloom at Abbotsbury, whereas here it opened its first fragrant flowers on September 15. In normal seasons we are content to lag far behind southerly latitudes in the production of flowers and fruit; but this has been an abnormal summer. We in Scotland have enjoyed warmth and sunshine while Midland and Southern England has been drenched with cold rains; yet vegetation has complied with the floral calendar of the respective countries rather than with the climate.

Talking of *Euryphia cordifolia*, it flowers too late with us to ripen seed, so we have had recourse to cuttings for propagating it. Those we set some years ago behaved in a singular manner. They remained green as when put in, but it was not till the third year that they struck, after which they grew vigorously.

I have read somewhere that it is unusual for *Anemone japonica* to set seed in this country. We have, however, raised some fine varieties from seed ripened here, some of which are equal to, though varying in colour from, Queen Charlotte, finest of pinks, and Honorine-Louise, most perfect of whites.

No autumnal flower is more greatly to be prized than the Swiss Wood Gentian, *G. asclepiadea*, not only for its beauty and profusion, but for its long succession of bloom, one plant taking up the running as another fades. It begins to flower in July, and some clumps have deferred their display till mid-September. It sows itself freely in the woodland; indeed, that is the best place for it, rabbits leaving it severely alone. Seedlings vary a good deal in colour, from deep, pure blue to pure white. Those with a purplish tinge, though very pretty, we extirpate, and the best of all are clear sky blue.

In a note on *Morisia hypogaea* on p. 105 Mr. Arnott remarks that he has never seen seeds produced. Neither have I seen them; the plant is of such crouching habit and such dense leafage that I have never examined the fructification; nevertheless, we have convincing evidence that seeds are produced and ripened. A thriving plant of *Morisia*, now measuring 9 inches across, has grown for seven or eight years on a flat border near the top of a retaining wall. It has for a neighbour a carpet of *Raoulia australis*, in the midst of which seedlings of *Morisia* have appeared. Unluckily, the first of these paid the penalty of its resemblance to a seedling of the common Groundsel; but we know better now. *Morisia* is one of the brightest and earliest of Alpines, and we have found it to do best when the ground about it is spread with old mortar, which, if it does not contribute to its nourishment, is more comfortable as a couch than the cold soil. Herbert Maxwell, Mourville.

ORCHID NOTES AND CLEANINGS.

LÆLIO CATTLEYA OPAL.

From the gardens of Sir Alex. Butler, Bart., Bloombill, Stratton, Mr. C. Keich sends the first flower of a new cross between *Cattleya Caduceus* (granulosa) × Gaskelham and *Lælio Cattleya Wellsiana* (*Cattleya Trianae* × *Laelia purpurata*), taken, it is said, from a very small plant. The flower, in size and form, resembles *Cattleya Percivaliana*, and little trace of the *C. granulosa* ancestor appears. The flower is salmon-pink with a bronze shade and slight tinge of rose; the lip purple in front and veined with yellow at the base.

THE MARKET FRUIT GARDEN.

CULTIVATION OF LUCERNE ORCHARDS.

SOME objections to my plan of sowing Lucerne in mature Apple orchards after bottom fruit has been grubbed up, appear to me to call for attention. The first is that Lucerne, as a deep-rooting plant, will draw water from the soil, and thus lead to the injury of the trees in dry seasons. As to this, it is true that Lucerne will absorb water from the subsoil, but this is desirable where the subsoil is one to hold water. It seems to me that the crop will draw water from the subsoil, where it is in superfluous quantity, store it, and keep the surface soil

the worst the orchard will have been fertilised by the growth of a nitrogen-accumulating crop for a season or two, and this will prove beneficial, even if the land has to be dug, or allowed to grass itself over. It is suggested that ordinary or wild White Clover would be preferable to Lucerne, but the former is not perennial, and the seed of the latter is extremely expensive, while neither is a weed-smothering crop, as Lucerne is to a great extent. Further, it is urged that, if Lucerne is grown, the cut crops should be taken off the land and used as food for live stock. This, however, would be impracticable, unless the stuff were all carried off by hand, as there is no room between trees with

FIG. 44. *EUCRYPHIA CORDIFOLIA*.

(See Sir Herbert Maxwell's "Notes from a Galloway Garden," p. 125.)

BRASSO CATTLEYA VIRGINIA

MR. JAS. SMITH, Orchid grower to the Duke of Marlborough, Blenheim, Woodstock, sends a large and handsome flower of a cross raised at Blenheim between B. C. Madame Chas. Maron and a seedling *Laelio Cattleya* recorded as having a very dark lip, a character which does not appear in the hybrid. The flower, which is 7 inches across, is clear silver-white tinged with light mauve at the edges of the petals and front of the fringed labellum, which has a chrome-yellow disc. It is desirable to introduce deeper shades of colour into the *Brasso-Cattleyas*. In crosses between *Cattleya Dowlana* and varieties in which rose and purple predominate it is known that colour vanishes with the cross made one way and is intensified by the reverse cross.

most in summer after the crop has been cut and left to rot on the ground as a mulch. Although all my orchards are more or less completely drained, trees suffer from excessive moisture in wet seasons, particularly in connection with attacks of fungous diseases, and I greatly prefer drought to flood, if we must have one extreme or the other. The second objection is that if the cut crop is left to rot on the ground it will be probably found that a fungous disease, such as *Botrytis cinerea*, will attack it and spread to the living plants, killing them. Whether or not there is any risk of such results experience alone can determine, but, seeing that a Lucerne crop grown for cutting when green for horses must always leave a little on the ground to rot, and no such results have been noticed by me or reported, so far as I have seen, the danger does not strike me as serious. At

overhanging branches for loaded carts or wagons. Besides, the fertilising effect to be obtained by growing the crops, and leaving them on the land, would be mainly lost. It is to be admitted that the plan is only an experiment, which, so far as I know, has never been tried before. My critic says that Lucerne is commonly grown in orchards in the United States, but this, I believe, is an error. I have read much about "cover crops," and the "sod and mulch" system in American publications, but have never seen Lucerne mentioned. Cover crops are grown to be ploughed up annually, and there would be no use in growing a perennial like Lucerne, which, moreover, does not produce enough for the first cut in the year of sowing to suit the plan; while the "sod and mulch" system is that of allowing an orchard to run down to grass and cutting the crop to use as a mulch around the widely separated trees.

other materials grown outside being sometimes added. At present the chief difficulty in my Lucerne orchards is that the crop gets trampled down by workers engaged in spraying or picking fruit off the trees or off the ground. Wind falls are preserved from injury by falling on to the crop of Lucerne, but are more difficult to find than where they fall on to cultivated ground. The crop of the first season had to be cut a first time just as it was about to blossom, for the benefit of the plants. Next year this necessity will not arise, and each cutting can be arranged so as to prevent, as far as possible, the objectionable circumstances just mentioned. The expense of cutting the first crop by hand and spreading it was only a little less than having all the ground would have been. That expense, however, has been about halved by using a one-horse mower, without the swather, between the rows of trees where there is room for it. *Southern Grower*.

HARDY ARISAEMAS.

I do not think it is generally known to lovers of rare and curious plants that several species of the genus *Arisaema* from the Himalayas are perfectly hardy in England if planted in a shaded bed of vegetable soil deep enough to prevent the large, fleshy tubers from being frozen in winter. Many of them have been introduced in the last 50 years by Mr. Gamme and myself, but they do not seem to remain healthy under pot culture for long.

I have now in cultivation the following: *A. speciosum* (Bot. Mag., t. 5964), a very beautiful plant with large spathe striped with purple and a long filiform tail to the spathe. This is one of the commonest and most ornamental in the forests around Darjeeling, but I have not yet proved it to be hardy. It has, however, ripened seed in a cold, shady frame this season. *A. galathea* (Bot. Mag., t. 6457). I have lost my plants of this species. It is a handsome and curious species well worth growing. *A. tortuosum*, Schott (Bot. Mag., t. 5951) as *A. curvatum*, Kunth. Though not so beautiful as some others, this species is curious, and so hardy that it has ripened its seeds under a north wall and seedlings have come up naturally. *A. flavum*, Schott (Bot. Mag., t. 7700). A species more curious than beautiful, introduced from Hazara, N.W. Himalayas, by Mr. Duthie to Kew, where it flowered in 1899. It also grows in the Trans-Indus Curran valley at 7,000 feet. Sir Joseph Hooker said that he could see no difference whatever between Indian specimens and the plant discovered by Forskal in Arabia in 1763, though it has been found in no intermediate locality. The plant has proved perfectly hardy at Colchester. *A. nepentholoides*, Mart. (Bot. Mag., t. 6446), *A. affine*, Hook. (Bot. Mag., t. 6474), and *A. Griffithii* (Bot. Mag., t. 6491), were all introduced by me more than thirty years ago, and I believe will prove hardy, as they come from high elevations in Sikkim and most of the plants of that region do not start into growth here until all risk of summer frosts is past. All of them have large and beautiful leaves and flowers.

A. Walliichmanii, Hook., of which I send a photograph (fig. 35), was collected by me in Sikkim four years ago. I believe the plant will prove hardy, though I have not yet established it.

A. consanguineum, Schott (fig. 46), which is now in flower, was described from the Himalayas, but was introduced from China recently. I think by Wilson. Both the flower and foliage are very ornamental, as may be seen in the illustration, and the plant seems as hardy as any of its congenere. *A. conicum*, Schott (Bot. Mag., t. 5914), has flowered in my garden for several years and has never been injured by cold.

I have also another species, collected by Forrest, with foliage quite distinct, but I have not yet flowered it.

It must be remembered that these plants are

FIG. 35. ARISAEMA WALLIICHMANII.

grown in the forests in a deep bed of soil, and need planting in cool, damp places. H. H. Curson, C. S. Bours.

FIG. 36. ARISAEMA CONSAQUINEUM.

PUBLICATIONS RECEIVED.—*The Quince Borer and its Control*. By F. W. Pettew, B.A. (Union of South Africa, Department of Agriculture, Pretoria, Government Printing and Stationery Office.) Bulletin No. 2 of 1917. *Coccidiosis of the Fowl*. By H. H. Curson, M.R.C.V.S., Bulletin No. 3 of 1917. Address as above.

LETTERS FROM SOLDIER-GARDENERS.

GARDENING IN NORTHERN EGYPT.

In the public gardens and open spaces of Northern Egypt, very few ornamental foliage plants, such as *Codiaeum* and *Dracaena*, are to be seen, although fine shrubs of *Acalypha musaica*, *A. marginata*, and *A. rubra* are well established. *A. musaica* is used as a hedge, forming a partition between one part of a garden and the other. The specimen observed had dropped a few of its bottom leaves, but it was in an excellent setting, against the white, painted façade of a private residence, which effectively showed off the colour of the foliage. *Strobilanthes Dyerianus* did not look very striking, except the coloured terminal growth, which is attractive. *Hibiscus* is well suited to the Egyptian climate; the shrubs abound nearly everywhere, planted as single specimens, or grouped with other trees. They appear to do equally well in the shade or in full sun; one has large scarlet flowers which find a magnificent setting among the wealth of dark green, glossy leaves. *Hibiscus grandiflorus* was at its best in August, unfolding its beautiful white flowers early in the morning. These have the peculiarity of changing to rose colour during the day. The leaves of this variety are much larger than those of its congener, but it does not so readily form a symmetrical tree or shrub. *Lantana* are numerous. *L. delicatissima* is sometimes planted in beds and kept at a uniform height by clipping, sometimes allowed to grow naturally. In one place, planted at the base of a low building, it served the useful purpose of masking the structure. *Cestrum elegans*, and a species darker in colour which I took to be *C. Newallii*, were growing in association with *Lantana* and *Hibiscus*. They formed a screen in front of the masonry of a roadside wall which helps to enclose the Zoological Gardens at Giza, each species trying to rival the other in a struggle for supremacy, and both yielding a wealth of flower. *Duranta Plumieri* makes a formidable thorny hedge. I was disappointed at not seeing it in flower. In the Palace Gardens of Bulak Darwan, the plants were studded with buds on the current season's growth early in December. F. Gamble, formerly at Calbury House Gardens, Totton, Hants.

GARDENING IN "EDEN."

I am working in the Agricultural Department, Sheikh Sand, Basra, where we have a large vegetable farm of 50 acres, and at present we are very busy indeed. We hope to be able to grow a lot of vegetables for the troops, as they are very scarce indeed here. It is interesting work laying out the garden. Everything has to be grown by the irrigation system, which I find very different from the English style. Before coming to this place I was in charge of a small garden for supplies. They wanted a gardener, and mine happened to be the only name sent in, so that was my first attempt at gardening in this part. The garden at first sight would have disheartened almost anyone, being then a mass of weeds and bushes, and I was handicapped by not knowing much about growing vegetables by irrigation, but I learnt much from the Arab cultivators. We managed to make a success out of that small garden; it was 1½ acre, and I believe we grew the first Cabbages and Cauliflowers in this country. They were quite good, many weighing 5 lbs. each. During the months of January and February only, we supplied 20,000 lbs. of vegetables, and I hope we shall have greater success with the larger garden we have at present. So far we have supplied daily about 200 lbs. of produce to the hospitals, &c. Our crops are the following: Cabbage, Cauliflower, Lettuce, Spinach, Kale, Beans, and Peas, and all are doing well. The Peas are first favourites. I have never seen in England healthier looking crops. The soil is very rich.

and similar to the soil at Tongswood; very heavy, and there is not a stone to be found in it, so it requires a lot of cultivating.

The hot weather crops, which consist of the following kinds—Melons, Marrows, Cucumbers, Bhesi, Brujals (?), and Tomatos—promise to be very fine later. We simply sow the seed in a channel at certain distances and give water when required. It is not necessary to stop the plants, nor to do many of the things which we find usual in England. No doubt, with special cultivation, better specimens could be obtained, but this extra trouble seems unnecessary, as it is not difficult to get Melon fruits weighing 7 to 10 lbs. each. The Sugar Melon (Melon Battikh?) is the best I have seen. The acreage of the crops here is: Melons 8 acres, Marrows 5, Tomatos 5, Brujals 5, Bhesi 2, and Cucumbers 3 acres. I find this work very interesting indeed, and it will no doubt seem strange to start again in the English style. *Sergeant Edward Aldridge, formerly at Tongswood Gardens, Hawkhurst, Kent.*

ON INCREASED FOOD PRODUCTION.

THE ONION CROP.

In many parts of the country I hear poor accounts of this important vegetable, and many beds which have come under my own observation are distinctly poor where they have not failed altogether. This is much to be regretted, as we are not likely to get importations this year as in the past, and already prices are unusually high. We place far too much faith in merely doing as our grandfathers did—sowing the seed in the open and more or less trusting to luck. We have much to learn from our Continental friends in the art of taking a little more trouble in relation to many of our vegetable and fruit crops, but in no case is it more necessary than in the cultivation of Onions. The seed should be sown in early spring in boxes, raised in cold frames and planted out immediately the young plants are large enough; work which can very well be done by boys or women. Fortunately no cold will harm the plants. This crop may be grown on the same spot for a number of years. If well planted one may rest assured of a heavy yield of early ripened bulbs which will keep much better than later ones, and transplanted Onions are seldom injured by the Onion fly. This method is by no means a new one, but, having proved its advantage over the system of sowing in the open, I strongly advocate the practice for general use. *E. Beckett, Aldenham House Gardens, Elstree.*

DEGENERATION OF POTATOS.

(See also p. 132.)

MR. CUTBERTSON says, on p. 122, "I am a doubting Thomas regarding this." My experience leads me to the same conclusion. I have this year grown some Snowdrop Potatos from sets, the stock of which has been grown by me continuously for thirty-three years, and it still crops and grows as vigorously as it did when I first had it. During this time it has had one change of soil, viz., from oolite limestone, where it grew for the first ten years, to a soil overlying lias clay, but no difference could be seen in the crop, although the quality was not so good on the clay soil, which is not surprising. I have also a form of the old Ashleaf called Empress Eugénie which I have had for the same length of time; this almost disappeared four years since, owing to severe and successive attacks of the "curl" disease; it has since recovered from that disease by selection and liberal manuring each season. The chief point with early varieties is to select the seed sets before they get overripe, green them, and store them carefully; late varieties are not so liable

to suffer from overripeness, but they must be given careful storage if they are to retain their vitality and vigour. *W. H. Divers, Westdown, Hook, near Sudbton.*

—MR. CUTBERTSON'S conclusions (see p. 122) are probably correct. Seed Potato tubers are likely to be weakened by storage in too low a temperature, but there is another aspect of the subject which may be worthy of consideration. Seed tubers which have failed to start into growth after planting may have become heated in the clamp to such an extent that the eyes have been killed. Owing to the shortage of labour all growers cannot start their seed tubers into growth in shallow trays. Secondary eyes are often made, but these would not have the same vigour as those of the first formation. Over-heating in clamps may be guarded against by the insertion of agricultural drain-pipes as ventilating shafts, these being partly closed in severe weather by being filled with straw. When Potatos are growing in a wild state in their native habitats do they reproduce themselves more readily from tubers than from the seeds found in the berries? A small point, such as this, might be worth studying. But the degeneration of Potatos cannot be wondered at if the distribution of seed tubers is undertaken by District Councils, greengrocers and others having little technical knowledge of the profession in which they are allowed to dabble with indiscriminate. *Frank James, Miteham.*

PRESERVING RUNNER BEANS.

SCARLET RUNNERS may be preserved for winter use. To preserve by salting, pick the Beans when dry, or dry them before a fire. Clean with a dry cloth, and put them raw into a stone jar or wooden barrel—a layer of vegetables and a layer of salt $\frac{3}{4}$ inch thick alternately until the vessel is full. Cover with a cloth resting on the vegetables, and on the cloth place a piece of board or a plate, weighted so as to press down the Beans. After a few days the vegetables will have settled, and the vessel must be tilted up again. Every week it must be cleaned by lifting the cloth and removing the scum which will rise to the top. Keep in a cellar or other cool place.

BRACKEN

It should be borne in mind by persons having access to quantities of Bracken that the potash yield of Bracken ash may be considerable, and that in view of the present scarcity of fertilisers this source of supply is well worth attention. The best time for cutting Bracken for burning is from mid-July to the end of October. The ash from green Bracken is more valuable than from the old and withered plant. Potash from Bracken ash is very soluble and should not be exposed to rain. The ashes should be collected and kept dry until required for use. They can be mixed with superphosphate before distribution, and may be applied with the above at the rate of 3 cwt. per acre to bare land; they should not be applied to growing crops. Potash is a valuable fertiliser for Potato land, especially for light loams and gravels and sandy soils.

242 LBS. OF POTATOS FROM 1 LB. OF SEED.

LAST April the Lower Hardres Association offered prizes for "the most Potatos grown from 1 lb. of seed."

The rector distributed to each of the 24 competitors 1 lb. of small Potatos generally used for seed.

At the end of April I arranged mine in a shallow tray—one layer only; placed the tray on a stage in a greenhouse and syringed the tubers two or three times daily till sprouted. I took off these sprouts, leaving a small heel of the tuber, say $\frac{1}{2}$ inch cub., adhering to each; these I placed in trays containing $\frac{1}{2}$ inch of light soil, until well rooted; thence each plant was moved into a 3 inch pot full of light soil.

In due course the plants were hardened off and planted in the open in a row 15 inches apart. I applied manure moderately, hoeing and earthing as usual, and sprayed them three times with Bordeaux mixture.

They were planted on May 1 and lifted on August 29, the tubers weighing 242 lbs. The crop was free from disease.

Weight.	No. of Roots.	Six Heaviest.
1st Prize ... 242 lbs.	... 80	... 4 lbs. 14 ozs.
2nd Prize ... 126 lbs.	... 48	... 3 lbs. 12 ozs.
3rd Prize ... 57 lbs.	... 17	... 5 lbs. 4 ozs.

E. S. Pigg, Lower Hardres, Kent.

FRUIT NOTES.

FRUIT GROWERS AND MILITARY SERVICE.

CONSTERNATION was caused recently in the big fruit-growing districts by the statement that, although an arrangement had been entered into under which no man engaged whole-time on a farm or on agricultural work could be posted for service with the Colours, except with the consent of the County Agricultural Executive Committee, this arrangement did not include men employed on a market garden for the production of flowers or fruit.

The matter was brought to the notice of the Food Production Department, and the War Office was approached at once. As a result an explanatory instruction has been issued to the local military authorities to the effect that the intention of the War Office was only to exclude from the arrangement mentioned above any men engaged in the production of luxury fruit, such as Grapes, Peaches, etc. Ordinary fruit-growers' fears should be set at rest by the knowledge that the Army Council recognises the importance of the common home-grown fruits and the jams made therefrom not only for soldiers but for the civilian population as well.

It should be clearly understood now by all concerned that the War Office realises that a man whole-time employed on a large holding in the production of fruit for jam is doing work that warrants his being protected by his County Agricultural Executive Committee from service with the Colours. Similarly, a man engaged in producing from a market garden vegetables and other crops of an amount and character to constitute "national importance" will not be taken out of the arrangement simply because a portion of the garden is devoted to jam fruit or because part of the holding is an orchard.

BAKED DAMSONS.

BAKING Damsons to preserve them is a very old West Country practice, and should be made a great deal more use of in these times where there is a plentiful supply of fruits. As I have seen them preserved, the Damsons were put in earthenware jars and small pans—chiefly the latter, because they take more fruit. Stone-made receptacles would likewise do, I was told. No sugar is used. Enough room is left at the top of the pan to take a plate in an inverted position, resting on the fruit just below the rim of the pan. Put in the oven, bake slowly until cooked, and then run some mutton fat around the edge of the plate to effect a seal. The use of the plate is obvious—it saves a great deal of fat. If desired—to prevent risk of burning—a dash of water can be put with the fruit, scarcely enough to cover the bottom of the receptacle, but no water is needed if baking be slowly done. My parents, from whom I learned the method, do not use water. Of course, if jars are used, covering with plates is out of the question, and sealing must be done with fat alone in the usual way. *C. Turner.*

The Week's Work.

THE KITCHEN GARDEN

By J. DUNN, Foreman, Royal Gardens, Windsor

LETTUCE.—Young Lettuce plants may still be planted on a warm border with a view to obtaining early spring supplies. The ground between the rows of earlier plantings should be frequently stirred with a Dutch hoe, and careful attention given to the destruction of slugs. A very light dusting of hot lime is the best remedy for this pest. All available cold pits should be filled with young Lettuce plants as quickly as possible; the soil for this purpose should be light and rich, and brought up to within 18 inches of the roof glass.

TURNIPS.—Dust the crop of late sown Turnips with soot, and hoe the ground between the drills, as often as possible. Turnips which are likely to become overgrown should be lifted at once and placed behind a north wall, where protection from heavy rains can be supplied. These roots may be kept in good condition for some time if lifted before they are too old.

MUSHROOMS. Attend carefully to the watering of Mushroom beds in bearing. Examine the beds frequently, and if the material is found to be too dry, water the surface with rain water through a fine rose. A light covering of clean straw will serve to retain the moisture in the soil and reduce the necessity for frequent watering, which is sometimes the means of destroying many of the young Mushrooms. If the atmosphere of the house is kept cool and moist, and currents of cold air prevented from reaching the beds, very little watering should be necessary. But it must also be remembered that a dry atmosphere is very detrimental to this crop. In order to maintain an unbroken supply of Mushrooms, prepare materials for the making of new beds. If horse droppings are scarce, fallen tree leaves may be mixed with the dung to increase the bulk by one third. The dung and leaves should be thoroughly mixed together and allowed to remain for two or three days before turning them, which should be done several times.

POTATOS. The whole of the Potato crop should be lifted as soon as possible, and where it is intended to save tubers for seed next season, these should be selected and placed on one side at the time of lifting the crop. The sets should be laid singly on shelves or trays and placed in a well-ventilated structure, where they may remain until frost is imminent. If the ware tubers are quite dry when they are dug and free from disease they may be stored in a store at once; otherwise they should be placed under cover and the light excluded from them until they can be examined critically in order to remove all affected tubers before they are arranged in the store for the winter. It is a good practice to spread the tubers with lime at this stage; they must be kept in perfect darkness.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTHOTE, Eastwell Park, Kent.

VIOLETS IN FRAMES.—Preparations for lifting and transplanting Violets to frames for the winter should now be made. If the plants have been given thoroughly good cultivation from the time of planting out of doors in the spring, and the runners kept pinched back, the strong crowns will be already throwing up blooms, and if lifted carefully the plants will quickly recover from the disturbance, and start flowering. Choose a frame in a sheltered position, facing due south if possible; one that has been utilised for growing Melons during the summer will suit admirably, if on a hot bed so much the better, as the gentle heat still remaining in the material will stimulate root action. Supposing such a frame is selected, some leaf-mould and sand should be thoroughly mixed with the loam, and some crushed charcoal if this is at hand. Bring the soil up to a level 9 to 12 inches from the glass. If the weather is dry when lifting is contemplated, the plants should

be given a thorough watering on the previous day. When lifting, be careful to preserve the balls of soil, and get them planted again as quickly as possible, as the plants soon flag. As space under glass in winter is always valuable, the plants should be put in fairly closely—that is, so that the outside leaves just touch each other. A few of the older leaves are almost sure to decay, and this will give a little extra space round each plant. Work the soil nicely round the roots, keeping the crowns well above the surface soil. When the planting is finished, water the plants, and if the weather is hot and bright, the lights should be put on, and the plants shaded for a day or two. Remove the lights again as soon as the sun sets to give the plants the benefit of the night dews, and in a few days the shading may be entirely dispensed with, and the lights drawn off altogether for the present. Light showers are beneficial, but if cold weather with a heavy rainfall is experienced for several days, as is often the case at this season, the lights should be used and ample ventilation given. The chief requirements are abundance of fresh air, with all the sunshine and light possible. The plants will not remain healthy in anything approaching a close and stuffy atmosphere.

THE FLOWER GARDEN.

By W. J. CRISE, Gardener to Mrs. DEMPSTER, Keele Hall, Staffordshire.

LAVENDER.—To increase the stock of Lavender, Rosemary, or Thyme, insert cuttings at once in sandy soil under hand lights, or boxes or in shallow frames. Short, well-pruned shoots of the young growths, taken off with a back-saw, are the best. Wire the cutting through a fine rose to settle the soil, and keep the frame close. The old plants may be trimmed with shears, cutting off all dead flowers, stalks, and straggling shoots. This is a good time to prune below the present season's growth.

PLANTING BORDER CARNATIONS. By this time the great majority of Carnations should be well rooted. The soil will continue to keep up for several weeks, and if the layers are true, planted at once the young plants will become established before cold weather sets in. Autumn planting is much the best method, except in cold, retentive soils. Select a position for the beds well exposed to the sun and air. If the soil is of a light nature, apply a heavy dressing of decayed manure, leaf-mould and cow-slash, and trench the ground to a reasonable depth. Where heavy, retentive soil has to be dealt with, leaf-mould, sand, manure, &c., or any old peatling soil may be mixed with the staple, and the beds or borders well drained and raised above the ordinary level. Beds made about a foot wide to take six rows will be found most suitable, as they are more convenient for staking, feeding and layering. Plant firmly and deep enough to cover the lowest part of leaves. A distance of 12 inches should be allowed between the plants and the same space between the rows. Examine the beds after frost, and press the soil to the plants that have been loosened. It is advisable to lay a reserve stock to replace failures. Place a number of plants in frames, boxes, or singly in 3-inch pots, using a compost of loam, leaf-mould and sand. Keep the frame closed and shaded for a few days, then continue freely, imitating outside cultivation as much as possible except in dry weather.

THE HARDY FRUIT GARDEN

By W. A. COOK, Gardener to the Rev. ALBERT J. DAVIES, All Saints' Church, Glediford, Hereford.

INSECT PESTS.—Trees infested with American blight should be thoroughly cleaned after the fruit has been gathered. Rub an insecticide on the parts infested, using a rather stiff brush for the purpose. If the trees are large, apply a very strong mixture of paraffin and soap with the garden pump, and renew the operation every few days. If the bark is infested with Oyster Scale insects, remove them with a scrubbing brush dipped in a mixture of equal parts of soap and warm water. This pest spreads rapidly, so remedial measures should be applied as soon as it is detected. The Pear scum appears at this season on Pears and Cherries,

and does much damage to the foliage. Dust the leaves with tobacco-powder and afterwards syringe with insecticide. If Pears are still flowering use tobacco-powder only.

THE STORING OF FRUIT.—Carefully attend to the work of storing fruits as they become ready for gathering. They are now ripening in large numbers, and unless great care is exercised some of them may be ruined altogether owing to the pressure of work. In the case of Apples and Pears, trays are useful for small lots, as they can be stood on top of each other; a label with the name and date when gathered, and probable date of being ready for consumption, will be useful, as so many inexperienced hands are now employed in gardens. In storing the fruits it will be convenient if those now coming into use are placed in positions easy of access. The latest ripening varieties can be put on the top and bottom stages. Do not stock any specked or bruised or very small fruits. Soft Pears should be placed over a thin layer of wood wool, and each fruit should be lifted out of the basket by hand and carefully placed in position. I am speaking now of selected fruits, which will be used for dessert, and none but those should be given a place in the premier fruit room, and on no account should any other matter than fruit be stored in this room, which should be kept scrupulously clean and sweet. Do not gather all the fruits from one tree at the same time unless they are perfectly ripe, because some will continue to ripen and improve after others have been removed, and the variety will be available for use over a longer period. The dropping of fruits is a great evil, and it will probably be found that they are discarded or infested with grubs. The later varieties of both Apples and Pears will continue to increase in size and colour for some weeks to come. From a west wall protected with nets I have gathered good fruits of Glou. Moreau, Josephine de Malines, Passe Crassane, and New Plus Meuris, in November, and after bad frosts have been on them.

FRUITS UNDER GLASS.

By JAS. HENSON, Head Gardener at Ginnensbury House, Ason, W.

THE PRUNING OF PEACHES AND NECTARINES. In Peach houses, where early, or moderately early forcing is carried out, it will be advisable to give attention to this work early in October. It is best to prune whilst some of the leaves are still upon the trees, for their presence will give an idea of the amount of thinning which is necessary. In some soils and districts the leaves are somewhat larger than in other instances. I have had my attention drawn afresh to this fact just recently. Overcrowding is most undesirable. Some Peaches are notoriously bad croppers, such, for instance, as the American varieties, Anson's June and Waterloo, therefore do not thin these out too freely. Make a point of pruning short, stocky wood and any short, spiky growths. These growths often in early houses will set more fruit than can be got from long shoots. It is not essential to proceed at present with cleansing operations, or with tying in the growths, by cutting forward with the pruning room will be found for plants that have for a time to be stored in cold houses, such, for instance, as Chrysanthemums. Do not, however, let any plants be stood directly upon the soil; pieces of plate, tiles or bricks should be placed under these temporary occupants of the house. Watch the borders as to moisture, and if the soil is at all dry give one good watering. Keep the houses well ventilated at all times, and even if plants are in them do not sacrifice the interests of the permanent trees for the sake of such plants.

EARLY VINERIES.—Pruning may now be commenced in the vineries. First proceed by cutting away all sub-lateral and the ends of the shoots that have not ripened. This will admit more light and air. Leave the ripened wood and all large leaf growth until the leaves drop of themselves. See that the indoor borders are not permitted to become too dry. In neither Peach houses, vineries, or other fruit house allow any warmth in the pipes that will be detrimental to the permanent occupants.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would oblige by delaying in obtaining answers to their communications and save us much time and trouble, if they could kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction in articles, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any notices which it is desirable to bring under the notice of horticulturists.

Letters for Publication, as well as specimens of plants, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last 53 years at Greenwich, 53.7.

ACTUAL TEMPERATURE.—
GARDENERS' COMPASS OFFICE, 41, Wellington Street, Covent Garden, London, Thursday, September 27, 10 a.m. Bar, 29.6; temp. 60.0. Weather bright sun-shine.

SALES FOR THE ENSUING WEEK.

MONDAY.—
10000 Bunches at 67 and 74, Chespole, at 1 o'clock, by PROTHROE & MORRIS.
TUESDAY and WEDNESDAY.—
Sole of a portion of the Globe Collection and other Orchids, at 67 and 74, Chespole, at 1 o'clock, by PROTHROE & MORRIS.
WEDNESDAY.—
Tenth Sale of Bulbs at 67 and 74, Chespole, at 1 o'clock, by PROTHROE & MORRIS.

The Colours of Flowers.

It is interesting to notice how rapidly recent work has cleared up the uncertainties that have so long existed concerning the nature of the beautiful red, purple and blue flower and plant pigments—the anthocyanins—that contribute so much to the splendour of Nature's summer dress. Much has been done to capture these secrets of the plant world, and a considerable amount of matter of interest to horticulturists has been collected.

In the first place, the relationship that exists between the two chief series of sap pigments—i. the yellow sap pigments (flavones); and ii., the red, purple and blue pigments (anthocyanins)—has been satisfactorily settled, and the colouring matters of the latter series have actually been prepared artificially from those of the former. It is now known that the change from yellow to red, purple or blue, is caused by the addition of hydrogen to the molecule of the yellow sap pigments (flavones). Curiously enough, this quite reverses the ideas previously held concerning the relationship that exists between these two series of pigments. Thus science has succeeded—as the yellow sap colours had

been previously prepared artificially—in producing these beautiful products of Nature in the laboratory; but there remain many important points yet to be learned concerning the manner in which these pigments are produced in the living plant. Like so many of the methods whereby the more complex of natural products have been artificially prepared, the method used for producing these colours in the laboratory is both long and wasteful, and contrasts greatly with the apparent ease with which the Pansy (*Viola tricolor*) produces up to 25 per cent. of its dry weight of the purple colour which, in some varieties, gives it its almost black appearance.

It has long been known that among the yellow and white flowers, more than one yellow sap pigment may be found in one and the same flower, e.g., the Wallflower, hence, the question naturally arises, is this equally true for the red, purple and blue sap pigments, or does each plant, or kind of plant, produce but one of these colouring matters? At first it looked very much as though "one flower one pigment" were to hold good, but as the investigation of these flowers progressed it was first found that one kind of flower could produce different pigments of this kind; thus the blue, deep purple Cornflowers contain the same colouring matter (the colour differing on account of different conditions of cell sap)—cyanin—whilst the rose-coloured Cornflower (the flowers investigated were stray ones of this colour which appeared in a large field of deep purple ones sown for the investigation) contains the pigment that occurs in the scarlet *Pelargonium zonale*, viz. pelargonin. Following upon this it has been discovered that whilst the scarlet *Pelargonium zonale* contains only the colouring matter, pelargonin, the violet-red varieties of *Pelargonium* contain both cyanin, the Cornflower pigment (the larger portion of the total colour in the flower), and pelargonin (smaller portion); i.e., one flower contains two of these pigments. Later work has brought to light further instances of the same kind. In view of this it can no longer be assumed that one kind of flower can only produce a particular red, purple or blue pigment, or, indeed, that of necessity there is but one of these pigments in any one flower. These discoveries naturally make the problems connected with the crossing of such species liable to much greater complication than would have been the case had the relationship of plant to colouring matter produced been less variable.

The investigations have shown that these pigments all exist in the plant attached to sugars, and, indeed, in nearly all cases the whole of the pigment present is in this form of combination; a few very interesting exceptions have, however, been found, of which particularly the Graue may be cited. In general, some small percentage of the colouring matter present in Black Graues (North Italian or hot-house grown) is at present unattached to sugars, and, indeed, in one case it was observed that as much as 12 per cent. of the total colour was in this condition.

When these compounds of the pigments and sugars are boiled with acid, they yield the true colouring matter, and the sugar with which it was in combination. The true sugar-free pigments of the *Pelargonium zonale* (Meteor), of the Cornflower, and of the *Delphinium Consolida* (purple), have been given the respective names Pelargonidin, Cyanidin, and Delphinidin, and it is interesting to note that thus far these three compounds form the basis of all the different red, purple and blue flower colours examined (some 20 in number), and are very widely distributed in nature. The differences in the natural pigments are due to the way in which these three are attached to the sugars, to the kind of sugar, or to the addition of chemical groups, other than sugars, to them. It may be hoped that other fundamentally different anthocyan pigments will be found, and there is some reason to believe that further investigation of certain kinds of Poppy will give realisation to these hopes.

When the question of the colours of flowers in general comes to be considered, there appear to be four chief causes of variation, viz., (i.) presence of different red, purple or blue pigments (anthocyanins); (ii.) presence of various yellow pigments (sap or plastid); (iii.) the reaction of the cell-sap (acid, alkaline, or neutral); (iv.) variation in the amount of each pigment that is present in the flower; and a few instances of the effect of each of these factors may not be without interest.

Although the effect of the last of these is often very obvious—thus the bright red and the deep red garden Roses contain the same colouring matter, cyanin, but in different amounts—it is not always an easy matter to judge the effect of variations in quantity of pigment in flowers, particularly in cases where sap conditions are different; thus, whilst the fine deep blue Cornflower contains only some 0.7 per cent. of colouring matter, cyanin, the deep purple-red flowers contain about 14 per cent. of the same pigment, and Cornflowers of a deep violet-blue colour showed on examination a cyanin content about 3.6 per cent.

In respect of (i.) above, it is a very interesting fact that whilst such cases as the Dahlia—of which the deep brown-red sorts contain cyanin, the scarlet-red kinds pelargonin—show how marked is the contrast of colour which the change from one of these pigments to another may cause, evidence has been collected which shows that in suitable circumstances the colours produced by the different colouring matters of this series may be so very nearly alike that no casual observer can differentiate between them.

The presence of yellow pigments when alone give rise to yellow or white flowers; in combination with reds, purples or blues, to scarlet, orange-red, salmon, orange, and green colours; it should be noted, however, that it is almost entirely the plastids—carotin, &c.—that are the active principles in giving rise to the yellow portion of these effects, the yellow

sap pigments being but very feebly coloured unless they are present as alkali salts. An instance of this may be given in the case of the deep yellow *Viola*; in a case examined it was found that the petals contained no less than 25 per cent. of their dry weight, of yellow sap pigment (Rutin), and only 0.6 per cent. of yellow plastid (carrotin), yet, despite this it was the plastid pigment to which the flower owed its colour, for after complete extraction of the sap pigment the petals were still orange-yellow, differing but very little from their original shade.

This brings us to the consideration of the effect of condition of cell sap, which is of great importance in view of the fact that all the sap pigments are more or less sharp indicators (i.e., substances which change colour when their solution changes from acid to alkali, or vice versa), but on account of the fact, already mentioned, that in most cases the yellow effects in flowers are due to plastid colours—which are not changed by change in cell sap—and that the sap yellows are but pale, and become colourless if slightly acid, the effect of change in acidity of the sap is by far more striking in the red, purple, and blue flowers. The scarlet of the *Polygonium zonale* (Meteor) results from the presence in the sap of plant acids, in the violet flowers of the Larkspur the sap is almost neutral, whereas the blue of the Cornflower is due to the potash salt of the colouring matter cyanin—this same pigment, cyanin, being responsible in acid cell sap for the red of the *Rosa gallica*. In general these colouring matters are red in the presence of acids, violet when neutral, and purple or blue when present as alkali salts.

Instances such as the above could be multiplied, but sufficient has been said to show the bearing that recent work in this field has upon horticultural and botanical problems.

SEEDS FOR ALLOTMENT HOLDERS.—The Food Department has issued the following table, giving the approximate quantities of each kind of seed sufficient for the purposes of the average allotment holder:—

Kind.	To sow up to about.	Quant. of seed.
Best, long, say 2 rows	100 ft.	1 oz.
Globe, say 2 rows	100 ft.	1 oz.
Spinach, say 2 rows	100 ft.	1 oz.
Bean, dwarf (double row)	50 ft.	1 pint.
Broad (double row)	50 ft.	1 pint.
Runner (double row)	50 ft.	1 pint.
Cabbage, &c.	—	1 oz.
For spring use (say 125 plants)	—	1 oz.
For autumn use (say 125 plants)	—	1 oz.
Savoy (say 125 plants)	—	1 oz.
Broccoli—	—	—
Early variety (say 50 plants)	—	1 oz.
Late variety (say 50 plants)	—	1 oz.
Sprouting (say 125 plants)	—	1 oz.
Brussels Sprouts (say 125 plants)	—	1 oz.
Cauliflowers—	—	—
Early variety (say 50 plants)	—	1 oz.
Late variety (say 50 plants)	—	1 oz.
Kale—	—	—
Curled (say 125 plants)	—	1 oz.
Flat (say 100 plants)	—	1 oz.
Carrot—	—	—
Long	75 ft.	1 oz.
Intermediate	75 ft.	1 oz.
Celery (say 100 plants)	—	1 oz.
Leek	90 ft.	1 oz.
Lettuce—	—	—
Cabbage	60 ft.	1 oz.
Onion	60 ft.	1 oz.
For spring or autumn sowing, for harvesting	120 ft.	1 oz.
For pulling green or pickling	45 ft.	1 oz.
Parsnip	75 ft.	1 oz.

Peas—		
Dwarf (double row)	40 ft.	1 pint.
Taller (double row)	40 ft.	1 pint.
Spinach	120 ft.	1 oz.

RULHLEN HORTICULTURAL SOCIETY.—An interesting report on Ruhlleben Camp Horticultural Society has been received through the Dutch Legation at Berlin. The Society was inaugurated on September 25, 1916. A committee was formed and permission was obtained to use a piece of waste land containing 10 rods, which was formed into a nursery. Public gardens were formed in various parts of the camp, and were planted with bulbs. The subscription was fixed at 1 mark, and by August 4, 1917, the membership was 921. All the woodwork of the frame-lights and greenhouse were made in the carpenter's shop by interned workmen, the glazing and construction being carried out by members of the society. Annuals were sown in large quantities and pricked out for transplanting to the gardens, besides about 20,000 Lettuces, Cabbages, and Cauliflowers, 1,500 Celery plants, 150

August 20, 1917, the total expenditure, including rent, amounted to M5,700.80; less refund from flower garden account, as per August 13, M81.45; Making the net total M5,119.35; and the total income from May 29 to August 20 amounted to M4,613.95, showing a balance to be cleared amounting to M500.40.

SUPPLIES OF BASIC SLAG.—The production of basic slag at the present time is being affected by the production of steel for munition purposes, and the supply of high grade slag is much less than formerly. As no export is now allowed, however, the quantity available for home consumption is larger, though still below the demand. Growers should obtain their supplies from the manure merchants, dealers, or co-operative societies from whom they usually purchase. They are recommended to place their orders at once, and to take the earliest possible delivery. The Food Production Department has come to an arrangement with makers in regard to the maximum prices to be charged by them, and the prices given below indicate the rate at

FIG. 47.—BARE-ROOTED CELERY AT ALDENHAM HOUSE, ESSEX.

Showing Mr. Burt's use of paper mulch for early and mid season crops.

(Photograph by R. A. Maltby.)

Marrows and 650 Tomato plants for outdoor cultivation. In addition to the spring flowers and bulbs, 20,000 plants were supplied for the barracks and public gardens. A flower and vegetable show was held on August 3 and 4, at which about 2,000 plants were staged. Through the kindness of the Ruhlleben officials the society has been able to procure a small quantity of stable manure, and the frames are utilised for the cultivation of Melons and Cucumbers. The committee has obtained permission from the military authorities to rent half of the inner part of the racing track for a vegetable garden, the rent being M100 per month. Digging operations were commenced on March 29, and were carried out under the supervision of a permanent paid staff of twelve men. About 250 men were employed. The soil was covered with rough grass, and was very sandy, streaked in places with a sandy loam. As soon as digging was finished, lime and artificial manures were hoed in, and sowing operations commenced. Arrangements are being made to procure seeds and manure, and as soon as the crops are off the ground digging operations will be recommenced, thus ensuring the prospects of still better crops next year. Up to

which growers should be able to purchase basic slag, excluding cost of delivery: For lots of 1 ton and over, 5s. per ton; for lots of 1 ton, but less than 4 tons, 10s. per ton; for lots of 2 cwt., but less than 1 ton, 1s. per cwt.; for lots of 1 cwt., but less than 2 cwt., 2s. per cwt.; for lots of 23 lb., but less than 1 cwt., 3s. per cwt.

PALM COURT FOR SWANSEA.—Swansea Corporation Park Committee has accepted an offer of Baroness CHRISTINA (Madame PATTI) to present the Corporation with the Palm Court at Craig-y-Neu, erected with heating apparatus, at a cost of £5,500. Madame PATTI's gift will form the nucleus of a winter garden, and it will be erected in the Victoria Park. The superintendent of Swansea public parks is Mr. D. BUSS, an old Kew man.

WAR ITEM.—Private JOHN BROADLEY, who was wounded in the right arm and chest by shrapnel on August 27, and is in hospital in France, was formerly a gardener at the People's Park, Skirbeck Quarter, of which his brother, Mr. T. BROADLEY, is head gardener.

Mr. J. K. BUDGE.—Among prominent representatives of Dutch horticulture well known to many in our own country is Mr. J. K. BUDGE, Curator of the Botanic Garden, Utrecht, who has just completed 25 years' service in that capacity. Mr. BUDGE first entered the Botanic Garden at Groningen in 1896. From there in 1898 he came to London, and was grower in the nurseries of Messrs. REVELS and SON, of Acton, cultivating Ferns and Poinsettias. Thence he proceeded to LAIRD'S Nursery at Edinburgh, where among other plants he grew Calceolarias, Cordinines, Orchids, and Aralias, and was the winner of several first prizes and a gold medal for groups. At the same time he was an evening student at the Heriot-Watt College, under Professor PATRICK GEDDES. Leaving this country, Mr. BUDGE became "Chef de culture" to Messrs. ANT. ROOZEN and SON, of Overveen, near Haarlem. The Botanic Garden at Utrecht is the most interesting establishment, and during the years of Mr. BUDGE'S service it has conspicuously reflected the care of its curator. In 1912 Mr. BUDGE was President of one of the sections of the International Exhibition at Chelsea. He has been a member of the Juries at Ghent, Petrograd, Mannheim, Hamburg and Amsterdam, and has been an official expert under the Phylloxera Convention. He is editor of the *Gardeners' Chronicle*, of Holland (*Ozei Tanteen*), and is head of a school for young gardeners. Those who have met Mr. BUDGE will remember his keen interest and energy in all that pertains to horticulture.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE ORIGIN OF THE POMPON DAHLIA.—A year ago I gave in these columns an account of my investigations, which proved that the Pompon Dahlia could not have been raised from Dahlia coccinea by Hartweg of Karlsruhe in 1808, as stated by certain writers. An eminent horticulturist in a neutral country shortly afterwards wrote to me confirming my contention that this section of the Dahlia was raised in Germany about the middle of the 19th century. His communication contained particulars of some researches he had made in German periodical horticultural literature, which he promised he would at a convenient opportunity still further extend, from many causes, but no doubt directly or indirectly connected with the war, he has not yet been able to attend to. In the meantime, I think it is important to place on record the information he has given to me, that his researches show most conclusively that the first Pompon Dahlia was raised by the well-known Dahlia specialist, J. Seckmann, of Kostritz, and distributed by him in 1851. The dwarf plants were then known as Liliputians, and the first coloured figure of them appeared in *Gartenflora* for 1852. C. Harman Payne.

THE EARWIG.—In the issue for September 1 your article dealing with this garden pest finishes with a reference to the old flowerpot trap method of capture. Admittedly good as this trap is, I think an old hollow stem of the Broad Bean is equally effective. Certainly the Bean stems are less unsightly and more easily managed. I use lengths of 6 to 8 inches, placing them among the lowest branches of bush fruit trees, or the pots of Chrysanthemums, on the ground under Dahlias, and among the grass tufts of lawn if necessary. The insect can be destroyed by tapping the ends of the Bean lengths on a vessel containing a little water with a dash of paraffin. Incidentally, the most up-to-date method (i.e., varnish method) is to use spent gun cartridges instead of flowerpots. I saw a quantity of cartridges so used in a large garden in Hertfordshire in 1915. C. T., *Amphill Park Gardens*.

EUSTOMA.—The almost pure white variety of Eustoma which W. T. mentions on p. 111, flowered at Kew in 1915, and must be identical with the one that flowered here in 1912. I did not consider it a good white, and marked it all over, but it has the same maroon

zone as the rose coloured form *Ellisii*. I did not intend to increase the stock of this except for crossing. It would be interesting to know whether the one flowered at Kew has a maroon zone in the centre. The beautiful colouring in the rose form is maintained as long as the flowers last, and it matters little whether it is a hybrid or a sport. One thing is almost certain, that I shall get double or semi-double flowers on the blue or maroon *Bussellianum*, as on two plants I have already got almost a double ring of petals, and the seed pods are divided, quite distinct from all the others. The rose coloured form is fixed, as all have come true from this batch except two small plants not yet in bud. C. J. Ellis, *Weston Super Mare*.

DETERIORATION OF POTATOS (see also p. 120).—The following history of the Midlothian Early Potatos at Wisley will answer Mr. Cuthbertson's inquiry in your issue of September 22. The seed tubers formed part of the crop raised in 1916 from seed purchased in Scotland. In 1916 the growth was excellent, clean, and vigorous, and the yield a very satisfactory one, 28 lbs. of "seed" giving 599 lbs. The seed tubers were selected when the crop was lifted, greened on the ground, put into boxes,

and were partially frozen on the journey; two or three tubers had to be replaced on this account, yet they grew away well, as the following notes, made on June 30, show:—Height, 24 inches; spread of haulm, 40 inches, in full flower. The yield was fairly good, 56 lbs. from twenty tubers, when lifted on August 3. The failure was apparently due to the seed tubers being affected by what is sometimes known as the "won't grow disease." The cause of this trouble is uncertain. It is, however, a trouble by no means confined to this variety, but quite general in Potatos grown in the south east of England (although not often so marked as in the present instance), and because of it the Scotch and Irish trade in seed Potatos flourishes exceedingly. It does not necessarily mean deterioration of a variety, but it does mean deterioration of a stock, as many know to their cost. F. J. Chittenden.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 25.—The fortnightly meeting held in the Drill Hall, Westminster, on Tuesday last, was the occasion of a special exhibition of vegetables. There were classes for collections and for single dishes, and the response was fairly good. A large and praiseworthy exhibit of vegetables was staged by Mr. E. R. JAMES, University College Gardens, Reading, for which a Gold Medal was awarded. Messrs. SUTTON and SON showed a comprehensive exhibit of Pumpkins, Gourds and Marrows. A noteworthy exhibit of Potatos was staged by Messrs. DOBBIE and Co., for which a Gold Medal was awarded. There were also several collections of hardy fruits, the most important being that of the Marquis of Ripon. The dried vegetables shown by the ALLIANCE VEGETABLE CO., LTD., included every variety that can be dehydrated, and formed an interesting demonstration of the art of drying. On the whole, the exhibition was more concerned with food produce than with flowers.

The exhibits before the Floral Committee were mainly Roses and Dahlias. The National Dahlia Society again adjudicated on Dahlia varieties, and many new varieties were submitted for award. Eleven received the Award of Merit of the R.H.S. and the First-class Certificate of the National Dahlia Society. The Floral Committee also conferred Awards of Merit on *Comstockia Willmottianum* and a new variety of *Michaelmas Daisy*.

Several groups of Orchids were staged, and the Orchid Committee granted two Awards of Merit to Novelties.

Floral Committee.

President: Messrs. H. B. May (chairman), R. C. Notcutt, S. Morris, W. J. Bean, G. Harrow, G. Reuther, John Green, J. T. Bennett-Poë, H. J. Jones, R. Hooper Pearson, W. Howe, J. Jennings, E. F. Hazleton, C. E. Pearson, F. Price Roberts, W. P. Thomson, John Heul, A. Tunner, E. H. Jenkins, J. Hudson, W. B. Cranfield, J. W. Barr, E. A. Bowles, H. Cowley, J. F. McLeod, J. Dickson, W. Cuthbertson, and Thos. Stevenson.

AWARDS OF MERIT.

Aster Joan Vaughan.—This new variety of *Michaelmas Daisy* belongs to the *Novi Belgii* section. The flowers are double, and coloured pale mauve; the individual blooms are 1½ to 2 inches across. The plant is said to grow 6 feet high, and to have very rigid stems, needing little support. Shown by Messrs. BAKER'S, LTD.

Ceratostigma Willmottianum.—This plant, which was shown by Miss E. WILLMOTT, Warley Place, Great Warley, closely resembles the well-known species *C. plumbaginoides*, commonly known in gardens as *Plumbago* *Larpetata*. This plant is figured in *Gard. Chron.*, Nov. 6, 1847, under the name of "Lady Larpet's Leadwort," soon after it had been shown at one of the Horticultural Society's meetings. The flowers of *C. Willmottianum* are of a rather paler blue than those of *C. plumbaginoides*, the anthers are very little exerted, and the leaves are hairy

MR. J. K. BUDGE, FOR 25 YEARS CURATOR OF THE UTRECHT BOTANIC GARDEN.

(See p. 131.)

and stored in a shed until December. They were then stood on end in sprouting trays and put into a glasshouse, where the minimum temperature was 40° F. They sprouted well and appeared in every way satisfactory when they were planted on April 4. They never grew well, and the weak, yellowish shoots contrasted in a remarkable fashion with the strong growth of nearly all the varieties (about 100) grown at Wisley this season. On lifting some in early June to see whether any pest had been at work upon them, it was found that in no case had the seed tuber decayed; it was, whether it had been planted intact or cut before planting, as solid to the feel as on the day it was put into the ground. It may be noted that the soil temperature at one foot from the surface on the day planting was done was 57.6° F., and it gradually rose thereafter. Other Potatos planted at the same time in similar conditions grew away well. In contrast with this, in one of the experimental plantings this year twenty well-sprouted tubers of Midlothian Early grown in Scotland, near Edinburgh, in 1916, were planted. They reached Wisley during the very

on both surfaces as well as on the margin. Furthermore, the buds are protected by leathery scales. Both species are hardy and easy to propagate; Miss Willmott, who has grown *C. Willmottianum* at Great Warley, states that it has grown into a shrub 5 feet high. The flowering time is particularly long, lasting from July to December, and the blossoms are produced in great profusion. The colour of the flowers is plumbeous to blue, with rosy-red corolla tubes; the leaves are green and hairy, with reddish margins, and the stems are also reddish. Shown by Miss E. WILLMOTT.

DAHLIAS.

Dahlia Transport.—A decorative variety of large size, but lacking in refinement. The creamy-yellow colour of the florets changes to a pale blush at maturity.

Snow Cloud.—A pure white Colerette Dahlia of medium size with very long quills. This and the foregoing were shown by Messrs. J. STREB- WICK AND SONS.

Mrs. Edward Moss.—A soft-pink coloured, Paeony-flowered variety of great value for garden and house decoration.

Sincerity.—A handsome Paeony-flowered Dahlia. The vivid crimson colour of the florets is enhanced by a golden centre.

Mark.—A scarlet Paeony-flowered variety of unusual substance. Like the last variety, it is well worthy of a place in any collection of this decorative type.

Cambria.—An exceedingly large, well-formed decorative bloom of soft-pink colouring which passes to nearly white at the tips, and the centre undeveloped florets are also almost white.

Planet.—A compactly formed Colerette Dahlia of velvety-maroon colouring. The quills are straw-coloured, with streaks of maroon. These five varieties were shown by Messrs. J. BURRELL AND SONS.

Fire King.—A somewhat star-shaped Coler- ette Dahlia. The scarlet florets are lightly tipped with golden yellow, and the quills are yellow streaked with scarlet. Shown by Mr. C. TURNER.

Autocrat.—A Colerette variety of almost sim- ilar colouring to the last, but a rounder, fuller bloom, though equally valuable for garden decora- tion.

Mrs. J. A. Jarrett.—A dull crimson Colerette variety, the florets tipped with mauve. The quills are flushed with purple. Both were shown by Mr. J. A. JARRETT.

Blush Star.—Another of the well-known star type of Dahlia, which is so valuable for decora- tive purposes. This variety is rather larger than the others, and is of a bright bluish colour. Shown by Messrs. J. CHURCH AND SONS.

The following medals were awarded to col- lectors:—

Silver Flora Medal to Messrs. F. CANN and Co., for Roses; and Messrs. H. B. MAY and Sons, for Ferns; *Silver Banksian Medal* to Messrs. B. R. CANN and Sons, for Roses; Messrs. J. CHURCH and Sons, for Dahlias; and autumn-tinted foliage; Messrs. ALAN DICKSON and Sons, for Roses; Mr. E. J. HINES, for Roses; Messrs. PIERCE'S, for bulbs; and ornamental shrubs; and Mr. J. B. BROWN, for Dahlias. *Bronze Flora Medal* to Messrs. ALLWOOD BROS., for Carnations; the Rev. J. H. PEMBERTON, for Roses; and Mr. J. C. ATTWOOD, for ROSA MOSSII. *Bronze Banksian Medal* to Messrs. W. WELLS, Junr., for hardy flowers.

Orchid Committee.

Present: Sir Jerningham Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. secretary), J. Wilson Potter, Arthur Day, William Bolton, Walter Cobb, Fred. K. Sander, Frederick J. Hanbury, E. R. Ashton, T. Ann- strong, R. A. Rolfe, J. E. Shill, H. G. Alex- ander and J. Charlesworth.

AWARDS OF MERIT.

Cattleya Iris Orchid-hybrid variety (Anaba) × *Doriana aurea*, from Messrs. ARMSTRONG and BROWN, Orchid-hybrid, Tunbridge Wells. A hand- some variety, and the tenth of this favourite cross to receive an award from the Orchid Com- mittee. The small plant bore a large and well- formed flower, the sepals and petals of which

were pale yellow tinged with a purplish bronze shade. The broad front lobe of the lip is deep rosy mauve, with a freckling of yellow at the base.

Brassia Cattleya Bene. The Birds (B.C. Mm., Chas. Maron × *C. Downiana aurea*), from Messrs. HASSALL and Co., Southgate. A large and deli- cately tinted flower, of a clear peach-blossom shade, with a deeper rose tint on the lip, the sides of which bear oblong yellow patches on a white ground, distinctly reminiscent of *Cattleya Warszewiczii*, which, with *Brassavola Digbyana*, produced B.C. Mm., Chas. Maron.

GENERAL EXHIBITS.

Messrs. ARMSTRONG and BROWN were awarded a Silver Flora Medal for a group of *Laelia Cattleyas* and other Orchids. The *Laelia Cattleyas* included fine white forms, the best of which was *C. Lady Veitch*. A fine pure white, home raised *Laelia primula alba* was also shown, and novelties included *Laelia-Cattleya Maupeda Saturata* (C. Lord Rothschild × L.C. Geo. Woodham), a finely-coloured flower, the chief feature of which was the distinct yellow blotches on the lip;

McNabiana (M. Bleuma × O. Edwards), bore a tall, many-flowered spike of rosy-mauve flowers.

Messrs. FLORY and BLAYK, Slough, showed a fine form of their *Laelia Cattleya Soulangue* (L.C. Lestre × C. Downiana aurea); the rose coloured flower has a broad, rusky purple lip.

Fruit and Vegetable Committee.

Present: Messrs. A. H. Peatson, vice chair- man, W. Pope, H. Markham, A. R. Allan, F. Jordan, J. C. Allgrove, J. Harrison, W. Bates, Owen Thomas, W. Poupert, W. Wilks, E. A. Bunyard, A. Bullock, and A. W. Metcalfe.

A Gold Medal was awarded to the UNIVERSITY COLLEGE, READING, for a collection of vegetables, representative of most kinds in season. All the produce was of the best quality, but the most notable sorts were New Red Inter- mediate and Scarlet Intermediate Carrots, Parsnips, Cucumbers, Late Queen Peas, Eclipse Tomatoes, Black Beet, Prizetaker Leeks, and Cranston's Excelsior, Exhibition, and Ailsa Craig Onions.

Messrs DOBBIE and Co. showed fifty baskets

FIG. 46.—A BUDGET OF ONE BUSH OF WINDSOR CASTLE POTATO, CULTIVATED BY MR. EDWIN WOODMAN, SILWARD TO W. H. MYERS, ESQ., SWANMORE PARK, BISHOP'S WALTHAM. (The tubers numbered 497, 498, and their weight was 1 lb. 10.)

Odontoglossum W. E. Bissel (perispium Mossiae × *Mossii*), a large, bluish-white variety, with closely arranged purple blotches; and O. S. T. Wright, two-thirds of the inner parts of the segments of which were reddish violet, the margins and tips white.

Messrs. CHARLESWORTH and Co., Haywards Heath, were awarded a Silver Flora Medal for a group of showy hybrids; novelties included *Brassia Cattleya Solrano* (B. C. Mrs. J. Leeman × *C. tridesensis*), with primrose-coloured sepals and petals, and neatly formed fringed labellum with greenish-yellow disc; and *Cattleya Sirius* (Germania × *Tranee*), a great im- provement on *C. Germania grandulosa* (Hardyana), the flower being large, bright rose in colour, with ruby purple front to the lip, the shape of which indicates *C. grandulosa* but with more ample proportions.

Messrs. HASSALL and Co., Southgate, were awarded a Silver Flora Medal for a group of hybrids raised at Southgate. They had a fine *Cattleya Sabil*, several forms of *Brassia Cattleya Bene*, fine varieties of *Cattleya Regina*, good *Laelia Cattleya Romanica*, and L. C. Rhombus.

Messrs. SANDERS, St. Albans, were awarded a Silver Banksian Medal for a group in which the coming season of the *Cypripedium* was well de- monstrated by an excellent selection. *Odontonia*

of Potatoes, all of first-rate quality, staged on a ground of black velvet, with trails of Saxifax for decoration. Favorite, Prolific, Majestic, Witch Hill, Express, The Provost, Admiral, and King Edward, were represented by excellent speci- mens. At the back were seedling Potatoes, many of them of great promise. (Gold Medal.)

Messrs. SUTTON and Sons showed Marrows, Gourds and Pumpkins, for which a Silver Knightian Medal was awarded. The largest specimen was Sutton's Mammoth Pumpkin, and Long Green, Long White, and Long Yellow were the largest of the Marrows. Olmo and Hubbard Squashes (the former yellow and the latter deep olive-green) were also of large size, with a pointed apex.

Messrs. DICKSON and ROBINSON showed thirty tubers of their Premier Onions, many weighing 3½ lbs. each. They showed also some fine bulbs of the Royal Keeper variety, of a flatter shape.

The Marquis of EROSS, Coombe Wood, King- don Hill (22, Mr. Smith), showed a fine exhibit of handy fruits, for which a Silver Knightian Medal was awarded. Mr. J. C. ALLGROVE, Langley, Slough, showed boxes of Plum Cook's Golden Drop, Golden Transparent, and President, for which he obtained a Silver Banksian Medal. Mr. H. Cross, Ovington, also obtained a Silver Banksian Medal for Apples and Pears.

COMPETITIVE VEGETABLE CLASSES.

The most important class was for a collection of 12 kinds, distinct, to be selected from a published list. **W. H. MYERS, Esq.**, Swanmore Park, Hants (gr. Mr. G. Ellwood), won the 1st prize and the Sutton Challenge Cup. His best specimens were Carrot New Red Intermediate, Ailsa Craig Onion, and Best of All Tomato. The 2nd prize was won by **Mr. T. JONES**, Bryn Penylan, Raabon, 3rd, Duke of Wellington, Strathfield-saye House, Mortimer, Berkshire (gr. Mr. E. Matthews).

ESTACE PALMER, Esq., Sherfield on Lockdon, Basingstoke (gr. H. E. Wallis), won the 1st prize in the class for 9 kinds, his exhibit including fine specimens of Champion Horn Carrot, Best of All Tomato, Superlative Potato, and Gladstone Pea; 2nd, **Hon. Mrs. H. GREVILLE**, Polesden Lacey, Dorking (gr. Mr. H. Prince).

In Class 3, for 6 kinds, the 1st prize was awarded to **Miss E. BRADSHAW**, Steeple Aston, Oxon (gr. Mr. R. Wadhams), with a good exhibit including Ailsa Craig Onion, Best of All Tomato, and New Red Intermediate Carrot. The 2nd prize was won by **G. THORN, Esq.**, Welhamborough, Ashford, Kent.

J. B. FORTESCUE, Esq., Droppore, Maidenhead (gr. Mr. C. Page), was placed 1st in the class for a collection of 12 varieties of Potatoes. The 2nd prize was awarded to **Mrs. A. SMART**, Lansdowne, Abergole, Denbighshire (gr. Mr. R. Rogers). In Class 5, for 6 varieties of Potatoes, there were three competitors, **G. THORN, Esq.**, Willesborough, Kent (gr. Mr. Hood), and **W. H. MYERS, Esq.**, were awarded the 1st and 2nd prizes respectively. **Mr. MYERS** gained the 1st prize in Class 6, for a collection of Onions, White Italian, Blood Red, Ailsa Craig, and Brown Globe varieties being exceedingly fine. The 2nd prize was awarded to **ESTACE E. PALMER, Esq.**

For a collection of salads, 6 distinct kinds, **Mr. MYERS** was again successful, showing fine specimens of Ideal Cucumber, All the Year Round Lettuce, Batavian Endive, Perfection Tomatoes, and Superb Pink Celery; 2nd, **Miss E. BRADSHAW**.

SINGLE DISH CLASSES.

Classes 3 to 38 were all for single dishes, and they were, on the whole, well contested, and some meritorious exhibits were shown. **Miss E. BRADSHAW** was awarded the 1st prize in classes for (a) Scarlet Runner Beans, with the Variety Prize-winner, (b) Parsnip (Tender and True), (c) Carrots (New Red Intermediate), (d) Purple Top Turnips, (e) Tomatos (Perfection), and of any other vegetable not enumerated in the schedule with fine heads of Silver Snake Beet. The Duke of Wellington obtained first prizes for (a) Climbing French Bean, (b) Peas (Gladstone), and (c) Curled Kale. **Mrs. JENNER** was placed 1st among ten competitors for Globe Beet, and for Onions with splendid bulbs of Premier variety. **Sir MOSTYN TURPIN**, Bodfords, Havering, Romford (gr. Mr. A. J. Barrett), gained the 1st prize for Long Beet with good roots of Sutton's Black variety. **Mr. TOM JONES**, Bryn Penylan, Raabon, was successful in a number of classes, gaining 1st prizes for (a) Brussels Spouts (Exhibition), (b) Cauliflowers (Autumn Mammoth), (c) White Celery (Giant White), (d) Red Celery (Aldeham Pink), (e) Leeks (International), (f) Vegetable Marrows, (g) Stump-rooted Carrots (Mod.), (h) White Turnips (Mod.), (i) Yellow-fleshed Turnips, and (j) Yellow Tomatos.

Lady GOWER, Panshanger, Hertford (gr. Mr. R. Staward), showed the best three plants of Brussels Spouts with the variety Silver-on. The Hon. **Mrs. R. GREVILLE** obtained the first place among seven competitors for Cabbage with Wheeler's Imperial. **Mr. ESTACE PALMER** obtained the 1st prize in the class for Savours with the variety Perfection, and he showed the best Cucumbers with the variety Delicacy. **Mr. W. H. MYERS** was awarded the 1st prizes for Celestine and for coloured Potatoes (King Edward). **Mr. G. THORN** was awarded the 1st prize in the class for white Potatoes, with the variety Excelsior.

The Champion Challenge Cup, which was offered to the winner of the greatest number of 1st prize points throughout the exhibition (the winner in Class 1 excluded), was awarded to **Miss E. BRADSHAW**.

CROPS AND STOCK ON THE HOME FARM.

POULTRY IN THE ORCHARD.

ANOTHER season's experience has given further proof of the value of poultry in the orchard, whether the ground is under grass or cultivated. In my case the poultry run over the orchard all the year round. The trees show a marked improvement in appearance, especially in the colour of the leaves. In a Nut orchard, which was run over for several years by turkeys and ducks, the crops of Lord Grosvenor Apples planted among the Nut bushes gave this year an unusually heavy crop of huge, highly coloured fruits. The trees have not had manure in any other form since they were planted six years ago.

Apart from the manurial value of poultry, they aid considerably in keeping the trees free from Winter Moth caterpillars, especially when the surface is cultivated. They destroy many moths and caterpillars as they fall off the trees in June and July.

PRUNING ORCHARD TREES.

A STANDARD trained Apple tree thirty years old should give full crops of fruit from the tips of the branches to the centre of the tree, and should have a diameter of 30 to 40 feet. All branches should be trained on the cordon principle. Trees properly managed from the beginning do not require very much pruning to keep them in a thriving condition. Directly the fruit is gathered remove useless branches, cutting away all weakling growths to admit air, sunshine and light to the centre of the tree. Before the leaves fall a better idea can be obtained of the space required for the main branches. The final pruning of the current season's shoots can be done later.

Make arrangements for the planting of new orchards or for renovating old ones by grafting improved varieties upon them. Trees under thirty years old can be grafted, and will make larger trees in less time than newly planted ones. The early part of April is the season for grafting. Order the trees early to ensure good results by planting in October, before the soil becomes chilled. In a commercial orchard it is unwise to plant many varieties. Ascertain the local requirements, and plant accordingly. The trees should be standards, in view of the future utilisation of the grass for cattle. Of kitchen varieties the following are desirable: Grenadier, Lord Grosvenor, Norfolk Beauty, Lane's Prince Albert, Bramley's Seedling, and Newton Wonder. Dessert: Beauty of Bath, Devonshire Quarrendon, Worcester Pearmain, James Grieve, Allington Pippin, Blenheim Pippin, and Cox's Orange Pippin. They are placed in their order of ripening. The stations should be deeply trenched where the subsoil is stiff and of an impervious nature, to ensure good drainage. An inert, close subsoil is a cause of canker, Lichen infested wood, and silver leaf disease. *B. Molinaria*.

ANSWERS TO CORRESPONDENTS.

BOX EDGING: Constant Reader. The best time to plant Box edging is in February or March, provided the weather is favourable. Care should be taken that the plants do not suffer from drought afterwards, frequent waterings being necessary in dry weather. If a few plants are put in an odd corner at the same time they will be useful for filling gaps that may occur in the hedge during the first year of planting.

COOKING KOHL RABI: W. G. D. The common method is to peel the roots, cut them into four parts, and boil them for twenty minutes or half an hour, according to their age. A better method is to select the roots of the size of a cricket ball, boil them first, and then peel them. When cut into quarters or slices, the boiling in that condition washes out most of the flavour from the roots. We have never known any injury caused by eating Kohl Rabi cooked in the manner described.

NAMES OF FRUITS.—In the naming of fruits, we desire to oblige our correspondents as far as we can, but the task would become too costly and too time-consuming were there no restrictions. Correspondents should observe the rule that NOT MORE THAN SIX VARIETIES be sent at any one time. The specimens must be good ones; if two of each variety are sent, identification will be easier. The fruits should be just approaching ripeness, and they should be properly numbered, and carefully packed in strong boxes; cardboard is often smashed in the post. A leaf or shoot of each variety is helpful, and in the case of Plums, Peaches and Nectarines, absolutely essential. In all cases it is necessary to know the district from which the fruits are sent. By neglecting these precautions, correspondents add greatly to our labour and run the risk of increased delay and incorrect determination. We do not undertake to send answers through the post, or to return fruits. Fruits and flowering plants must not be sent in the same box. Delay in any case is unavoidable.

NAMES OF PLANTS. Correspondents not answered in this issue are requested to be so good as to consult the following number:—*Miss L.*, Ceropogon Woodii.

SCALE INSECTS ON PEACH TREES: Constant Reader, Wilton. Scrub the main branches when the plants are defoliated with soft soap and paraffin, taking care to dislodge the scales. Afterwards deal with the smaller branches. This method takes more time than syringing, but a thorough scrubbing will remove the scale entirely. Give the woodwork of the house a thorough cleansing after the trees have been dealt with.

TOMATOS ATTACKED: P. H. The fly is the "White Fly," or Aleyrodes. Fumigate the house in which the plants are growing with a nicotine vaporising compound. Full directions for use are issued with the compound, which you can purchase from any horticultural sundriesman. Keep the Tomato house well ventilated.

MARKETS.

COVENT GARDEN, September 26.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—Eds.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing prices for various plants in pots, including Aralia Sieboldii, Asparagus plumosus, and others. Columns include plant name, quantity, and price.

REMARKS: There is only a moderate supply of plants. Small Ericas are improving in quality. Kalmia are the latest addition in this department.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing prices for cut flowers and other items, including Asters, Carnations, and Chrysanthemums. Columns include item name, quantity, and price.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing prices for cut foliage and other items, including Adiantum Maiden Hair Fern, Asparagus, and others. Columns include item name, quantity, and price.

REMARKS: The quotations and supplies are similar to those in our last week's issue. There are gradually clearing, although some fine blooms of the following sorts are available: Mme. A. Chabouat, Melody, Molly, Shamrock, Cranford, Doll Love, Liberty, Sunburst, and Wellington. Violets are more plentiful. A few bunches of double Marigolds are arriving, but they come thick the effect of the mild weather. White Asters are finishing. A few boxes of double White Stocks are still being received in excellent condition. Some very fine spikes of Nemesis are also received, which are effective for decorative purposes. There are only very limited supplies of French blooms, but a few good Cupressidiums are being

Vegetables: Average Wholesale Prices.

Table listing prices for various vegetables, including Artichokes, Beans, Beetroot, Brussels Sprouts, and others. Columns include vegetable name, quantity, and price.

Fruit: Average Wholesale Prices.

Table listing prices for various fruits, including Almonds, Apples, Apricots, and others. Columns include fruit name, quantity, and price.

REMARKS: The market is well supplied with Apples, but the supply is not so good as last week. The bulk of the supply is still in the hands of the growers, and the market is not so well supplied as last week. The supply of Apples is not so good as last week. The bulk of the supply is still in the hands of the growers, and the market is not so well supplied as last week. The supply of Apples is not so good as last week. The bulk of the supply is still in the hands of the growers, and the market is not so well supplied as last week.

DEBATING SOCIETIES.

BATH GARDENERS'. The meeting of the society, held in the Forester, Hill on the 10th inst., was devoted to a discussion on the subject of 'The English Garden'. The meeting was presided over by Mr. F. Purcell, Chairman of the society. A number of papers were read, and the subject was discussed in a most interesting manner. The meeting was held in the Forester, Hill on the 10th inst., was devoted to a discussion on the subject of 'The English Garden'.

By Special Appointment to  His Majesty The King.

MACKENZIE & MONCUR, LTD.,

HOTHOUSE BUILDERS,
HEATING AND ELECTRICAL ENGINEERS, etc.

Although we are at present employed largely on National War Service, we are still in a position to carry out urgent private work. We ask our patrons to give us as much time as possible for the carrying out of such work, so that we may arrange to have it done without reducing our War Service output.

LONDON—8, Camden Road, N.W.

GLASGOW—121, St. Vincent St.

EDINBURGH (Registered Office and Works)—Balcarres Street, Morningside.

Telegrams: "GLASSHOUSE, CAMROAD, LONDON," and "HOTHOUSE, EDINBURGH."

NOTICE TO SEEDSMEN, NURSERYMEN, MARKET GARDENERS, FRUIT-GROWERS, HORTICULTURAL BUILDERS, BOILER MAKERS, COAL MERCHANTS, AND SUNDRIESMEN.

Revision forms for the "Gardeners' Chronicle" HORTICULTURAL DIRECTORY have been posted to all the above whose names are already in the Directory. In order to facilitate the early publication of the revised edition for 1918, it is requested that the forms, with the necessary corrections, be returned **AS SOON AS POSSIBLE**. It is only by the co-operation of all interested in Horticulture that the new edition of this invaluable work of reference can be made perfect.

Anyone in the above categories who has failed to receive a form should send for one to

THE EDITOR, Horticultural Directory,
41, Wellington St., Strand, London, W.C. 2.

PROPERTY TO LET.

THE BARLEY FERRY, LAMER T. A. 1/2 acre, Market Gardeners, and other, from 10 to 15, 10/6 per week.

TO be LET, from Christmas, 1917, the whole well-known GARDENS, known as the Woodland Nurseries, for many years past in the neighbourhood of the late Mr. John Keywell, situate in the parish of St. Thomas the Apostle, and within one mile of the centre of the City of Exeter, comprising

- 10 1/2 P. (1/2 acre) 10 1/2 P. (1/2 acre) 15 0 14 (1/2 acre) 5 1 2 (1/2 acre)

The buildings consist of a factory, 160 x 212 ft. and commodious Dwelling-house, and ample accommodation for storing and packing fruit, a Carpenter's Shop, Stable, Washhouse, Washhouse, Pigsties, Cart, and other sheds.

The Gardens contain a stock of 2 1/2 the choicest sorts of standard Apple, Pear, Plum, and Cherry Trees, Gooseberries, and Currant Bushes, and Raspberry Canes. There is also Pear, Plum, and Cherry Trees on about 4000 bush of wall.

The whole Stock consists of about 7,000 Trees and 25,000 Bushes. The great part of it was planted by Mr. Keywell, who was in excellent judge of the most profitable and profitable sorts of Fruit to grow. The whole is now the property of the Landlord, and will be included in the letting.

Further particulars with permission to view, may be obtained, and the form of Lease Agreement inquired, at the offices of MESSRS. J. & H. DREW, 15, Queen Street, Exeter, Land Agents, and Surveyors.

SPECIAL NOTICES.

MR. R. GREENFIELD begs to remind all friends that, although engaged on National Service work, he continues Malton representative to John Paul & Son. Orders this season will be very much appreciated, and may be directed either to the firm at West Woodford, or to Mr. R. GREENFIELD, 61, Radford Road, Leamington Spa.

AN EIGHTEENTH-CENTURY DURHAM CATALOGUE.

MY articles on "Some Old Seed and Plant Catalogues" in the issues of the *Gardeners' Chronicle* for December 23 and 30 last produced so many interesting reminiscences, which, owing to a visit of several months to the United States, I have only recently seen, that I am induced to send some notes on a much earlier catalogue which has just come into my possession. Its title is "A Catalogue of Kitchen Garden, Flower, Grass, Forest, Tree Seeds, and Flower-Roots; with their Season of Sowing, Planting, and Culture; Chiefly adapted to the Northern Climates," &c., by James Clarke, Seedsman, at Houghton le Spring, near Durham, 1779. I can find no trace of any other copy of this catalogue. There is none in the British Museum nor the Bodleian; it is not even recorded in that monumental work, Watt's *Bibliotheca Britannica*, nor is it in G. W. Johnson's *History of English Gardening*, and it is unmentioned in the list of printed books appended to Hon. Mrs. Evelyn Cecil's *History of Gardening in England*. The rarity, therefore, of James Clarke's catalogue may be taken as proved.

But who was James Clarke? Unfortunately, on this point there is no information available. Even the date of his death has not been found, nor does his name appear in the *Extracts from the Houghton le Spring Registers, 1581-1812*, printed in 1910. There are there recorded several Clarks and Clarkes, but none that can be associated with the seedsman in whom we are just now interested. It,

of course, may be that James Clarke was living after 1812. Hutchinson, in his *History and Antiquities of the County Palatine of Durham, 1785-94*, deals exhaustively with the parish of Houghton le Spring, and particularly with its greatest celebrity, "the Apostle of the North," Bernard Gilpin; but there is no reference to Clarke or to his nursery, of which even the site is not now known. The present rector very kindly made inquiries for me, and the oldest inhabitant of his parish told him that when she was a girl a man named Hutchinson had a very large garden in a position now covered with houses, but she scarcely remembered the character of the garden. With this faint clue, and the possibility that Hutchinson may—*longa intervallo*—have succeeded Clarke as a nurseryman, we must for the moment rest content.

Another point of inquiry concerns the typography of the catalogue. It extends to 52 pages octavo, and is admirably printed. It was certainly not printed at Houghton le Spring. Durham or Sunderland would have been the most likely place at which to find a good printer at that time. We know from Cotton's *Topographical Gazetteer* that printing was in use in Durham in 1733, and in Sunderland during the latter half of the eighteenth century. But this catalogue is so well printed, and the title-page set up with so much taste, that one would be inclined to suggest that it was done in London. But the point is one of local rather than general interest, and the printer might be identified by comparing the typography of the pamphlet with books locally printed at about the same time, some of which are probably now to be found in the libraries of Durham and other large centres in the county.

The catalogue itself is quite an unconventional one, the author at the outset admitting that "I have taken the Liberty in the following Sheets to deviate from the Common Methods of Seed Catalogues," his wish being, not to supplant those who have written more copiously on the subject, but to "render the general Knowledge of Gardening more easily attain'd, to the young and unexperienc'd in this Branch." Instead of the usual lists now familiar, the author roughly classifies his subjects, the first of which is: "Seeds of Esculents, with their season of Sowing and Culture." Each vegetable is dealt with in a paragraph, with very brief directions for sowing, and the varieties named in the margin are doubtless those of which Mr. Clarke had seeds to sell. These lists are especially interesting to us as showing the kinds in cultivation in 1779. Of Onions, for instance, there were the Portugal, Strasbourg, White and Red Spanish, English, Silver-skinned, and Welch. Eight varieties of Cabbage appear to have satisfied all needs Dwarf, Battersea and Sugarloaf among the early ones, Russian, Flat or Scotch, and Long, which were late, and the Dutch and Turnip. Of Broccoli there were only the Purple and White; these were nine kinds of "Lettice," the White-

Green, and Red Cos, the Silesia, Brown Dutch, Capuchin, Imperial, Cabbage and curled.

Among the salad seeds we find Sorrel, Burnet, Orach, Fimochia (Italian Fennel), and Tarragon. Only four sorts of Cucumbers are mentioned, the Early Short and Long Prickly, and the Long Green and White Turkey, but this "esculent" was evidently regarded as an important crop, for two pages are devoted to its cultural directions. So, also, "Mellons" and "Pompions" (gourds) receive two pages. Among the "Medicinal Seeds" are enumerated Cardus, Scurrey-grass, Angerico, Lovage (perhaps *Achillea ligustica*), Smallage (this I cannot identify), Wormwood, Gronwell (Lithospermum officinale, at one time administered for the cure of gravel), Bill and Brown Mustard, Poppies, Caraway, Fenugreek (Trigonella), Coriander, Anise, and Cummin (Cuminum Cuminum), also occur among the sweet and pot-herb seeds.

Beans and Peas occupy a page and a half, the former headed by the Mazagan and followed by the Portugal, Small and Broad Spanish, and Windsor, and also with two other varieties, Toker and Bog Dwarf, which are not familiar to me. There are fifteen varieties of Peas, with, of course, various Marrow (or "Marrowfat" of later times), and one called the Reading, which suggests that it was raised at Reading, but long before the advent of Messrs. Sutton's business. There are also Tall and Dwarf Crooked Sugar Peas, which "are commonly gathered when young, and, when boiled, eat as Kidney Beans." Of these latter there are six varieties of the dwarf and four of the runners.

The prizes devoted to flower seeds, respectively grouped as Tender and Hardy annuals, and biennials and perennials, are divided into three columns, the first with cultural directions, the second with the name of the plant, and thirdly, "their colours." The Amaranthus appears to have been a popular plant, for there are six varieties. The Sensitive Plant, we are told, "closes by a touch," and the Humble Plant "falls by a touch." It is interesting to note that the Tobacco Plant was cultivated for decorative purposes: "if the Season prove favourable, it may be brought to great Perfection; if in the Autumn it be properly cured or dried, it will be equally good as that brought from Abroad." Bulbous and tuberous flower-plants are dealt with briefly, but no named varieties, perhaps because even in those days they were legion, are specified. The list of perennial flower-roots calls up visions of the old English gardens which were such attractions to our country homes during the eighteenth century. There are Wallflowers, Sweet Williams, the double Bachelor's Button, the double Ragged Robin, Pinks, Rockets, Soapwort, Paeonies, Sunflowers, and others.

Mr. Clarke catered for agriculture as well as for horticulture. We have succinct directions concerning grass and Clover seeds, Spurry, Buckwheat (which sounds American rather than English), Lentils,

Flax, Hemp, and Canary. There are also directions for the sowing and culture of Fir and Pine seeds, and of trees and shrubs of all sorts, evergreen and deciduous. Fruit trees occupy eleven pages. Of Apples there are 27 varieties, including Codlings, various kinds of Pippins, Russets, and Pearmain, "with many other sorts." Among Apples there were the Masculine, the Transparent, the Bunsell, and Anson's, "a kind lately introduced into English gardens, probably by Lord Anson, an exceedingly large fruit, and a good bearer." The May Duke and the White and Black Harts."

Is each, dwarfs on Paradise stocks, 10d., and those on crab stocks, 3d. Apricots, standards, from 1s. 4d. to 2s.; and dwarfs from 1s. to 1s. 6d.; Currants, Filberts, and Gooseberries were 2d. per plant; Pears, standards 1s. 2d., and dwarfs 1s.; Plums, 1s. 2d. and 1s.; Nectarines and Peaches, 2s. and 1s. 6d.; and Quinces, 3d. Like all other nurserymen, Mr. Clarke dealt in sundries, such as "all sorts of garden tools and bass mats." Altogether his catalogue forms a very interesting document in the history of gardening during the last quarter of the eighteenth century. W. Roberts.

From a fine-flowered spike, well represents that showy hybrid, and a large and finely-formed *Cattleya Wavriana* (*granulosa* - Warszewiczii) is included.

Masdevallia Boeking Hybrid and its parent *M. Veitchiana grandiflora* are also sent, Mr. Cypher remarking that he is seldom without flowers of these two handsome *Masdevallias*, which, like the *M. Harryana*, *M. Inza* and other showy species, thrive so well at Cheltenham.

Cypripedium Sir Redvers Buller (*insigne* × *Smithii*) (see fig. 49), taken from a part of the original, which received a First-class Certificate on January 9, 1900, shows it to be still the best of a very variable cross. The consignment includes *C. Rossetti*, one of the finest of the yellowish *Cypripediums*, and some *C. Rothschildiana* crosses.

ORCHIDS FROM BLENHHEIM.

MR. JAMES SMITH sends us flowers of hybrid Orchids raised in the Duke of Marlborough's gardens at Blenheim; the plants have been previously recorded, and being now matured, show their true characters. The finest is *Cattleya Veiris*, raised from *C. Venus* × *C. Iris*. The second use of *C. Iris* (*bicolor* × *Dowiana aurea*) in the parentage of this hybrid has given marked results, the form of *C. Iris* being retained, but the colour of the lip, which is blood-red with orange and rose shades, is intensified. The sepals and petals are pale yellow, veined and tinged with buff colour. *Cattleya Rexfil*, of which a three-flowered inflorescence is sent, is the progeny of *C. Rex* and *C. fulvescens* (*Dowiana aurea* × *Forbesii*), and adheres closely to *C. Rex*, the sepals and petals being light yellow and the lip rosy-mauve with gold lines from the base.

Cattleya Guillemont, raised from *C. Gaskelliana* and *C. Pittiana*, is a large flower with silver-white sepals and petals tinged and veined with pale lilac, of which the lip has a number of purple lines in front of the yellow disc. *Laelio-Cattleya Fazouana*, obtained by crossing *C. Fabia* (*labiata* × *Dowiana aurea*) and *L. C. Schulzeana* (*C. labiata* × *L. C. elegans*), is an interesting instance of intensified colour development, the cause of which is imperfectly understood, for its deep mauve flower with claret-red lip is darker than any of the parents. The question of colour in flowers is a very complicated problem, but it is known that there may be more than one pigment in any one flower, as stated in the leading article in the last

issue, p. 130. In certain conditions *C. Dowiana aurea* has been known to develop intensified colours inherited from other parents but not present in itself, and probably that has been the agent in the present case.

Laelio-Cattleya Ingrabaw, *Cattleya Lawrenceana* × *Laelio-Cattleya Ingrabawii* (*C. Dowiana aurea* × *L. Dayana*) has flowers of the *C. Lawrenceana* class, but with a more expanded lip. The colour is mauve; the lip has a purple front and deep orange base, with purple lines.

FIG. 49. —*CYPRIPEDIUM SIR REDVERS BULLER*.

ORCHID NOTES AND CLEANINGS.

ORCHIDS FROM CHELTENHAM.

Messrs. J. Cypher and Sons send us flowers of a selection of seedling *Laelio-Cattleyas* and *Cattleyas* recently in bloom in their nurseries. They show great variety in form and colour, the sepals and petals varying from white to rose, and the labellum from rose-purple to dark crimson. One of the latter type is very distinct, with a small, bright-yellow blotch on each side of the labellum. A very dark *L. C. Dominiana*, taken

the Kentish and Harrison's Duke, figure among the Cherries. Familiar varieties of Grapes occur, such as the Black, White, and Red Hamburgh and various Frontinians; there are also the Tokay, the Lombardy, and the Burgundy, the special features of which are briefly noted. Peaches, Plums, Pears, and Gooseberries and Nectarines are represented by what were the best sorts in cultivation at the time.

It is not until the last page of the catalogue is reached that we come to pines, and these are very modest indeed. Standard Apple trees were

TREES AND SHRUBS.

CERATOPSTIGMA WILLMOTTIANUM.

AMONGST the plants at the meeting of the R. H.S. on September 25 last was a specimen of this new species of *Ceratopstigma*, shown by Miss Willmott. It is one of Mr. E. H. Wilson's discoveries in Western China when he travelled for the Arnold Arboretum in 1903. He describes it as abundant in the semi-arid regions of the Mia River valley, in Szechuan, which was the only place in which he found it. Miss Willmott raised it at Warley from seeds collected by him, and it flowered with her in 1911.

In a wild state it grows from 1 to 3½ feet high, but under cultivation at Warley it has reached 5 feet in height. Its half woody stems are angled, purplish, and clothed with hoary tomentum. The leaves, 1½ to 2½ inches long, and often more or less diamond shaped, are also hoary. The flowers are borne successively in a large head terminating each twig, also in smaller ones in the uppermost leaf-axils. They are bright blue (Wilson says "cobalt-blue") and about 1 inch wide. Miss Willmott informs me that flowers have appeared with her as early as May, but its proper flowering season is probably from July to November. Few hardy plants have so long a blossoming season, and to this quality is added the beautiful and, among hardy shrubs, rare colour of its flowers. At Key last year it fell back to the ground, but sprang into vigorous life and flowered well during the summer. It is a most attractive plant, and evidently capable of bearing our hardest winters. *E. H. Wilson.*

POPULUS - GENEROSA.

I do not suppose my old friend Dr. A. G. Rees, Henry will object to my giving a gratifying account of one of his new hybrid *Populus generosa*, which he has been successful in raising. The tree, three years old from the cutting, has already made a growth of 17 feet, 8 inches in height during this year, and a measurement of the leaf, which I enclose, shows 9½ inches across the middle and 17 inches from base of stalk to tip, together with its brilliant dark green colour, will give you some idea of the amazing vigour of this new offspring of our botanical treasures. If the tree will keep up anything approaching to this rate of growth, it ought to prove a most valuable acquisition from the economic standpoint. *E. H. Wilson, Aldenham House, near Ely.*

WEEDS IN AUSTRALIA.

VALUABLE hints on the destruction of weeds are given by Mr. H. W. Davey, District Surveyor, Victoria, Australia, in a paper read at the annual convention of the Chamber of Commerce. Mr. Davey concludes from his experiments that arsenical weed killers, useful though they be for destroying weeds on gravel paths, are useless on cultivated land. These, employed in great strength and large quantities they only kill the tops, and if so employed they render the ground unfit for cultivation for several years.

For young plants eradicating petroleum or kerosene is much better.

Salt is effective, and in many cases also improves the fertility of the soil.

Mr. Davey comments on the fact that the "Thistle Act" is administered very laxly in parts of Victoria, and that Thistles may be seen growing in the yards of many public buildings. This testimony is valuable, inasmuch as demands for similar "noxious weeds" Acts are frequently urged in this country. We all wish to get rid of weeds, but most of us are tired of Acts which cannot be rigorously enforced, if all events until we all become Government inspectors. The worst weed in Victoria appears to be St. John's Wort (*Hypericum perforatum*). Though eradicable without great difficulty on

* *The Journal of the Dept. of Agric., Victoria, Australia, July, 1917.*

arable, it is very hard indeed to get rid of from pasture-land. As is the case with so many perennial weeds, owing to death by frequent cutting is in the long run the cheapest way of exterminating it. In southern parts of Victoria the Blackberry is becoming a serious pest, choking everything else—except St. John's Wort. Like many another pestiferous weed, it is an invader—in this case from Europe. Two or three cuttings, together with applications of salt, are required to exterminate it. *Rosa rugosa* is qualifying as a pest in Victoria, and so are African Boxthorn (*Lycium horridum*), largely planted for hedges in Victoria, and *Elmum violaceum*, known picturesque as Paterson's Curse. It makes its attack like so many weeds, by way of the railway line. Banken, too, is a well-wooded, nesting grass from steep hillsides. Cutting and salting are the remedies, and it may be remarked in parenthesis that this combined method in all will be a good one. The cutting should be done at least early in the late afternoon, the best done just before the plants show, and two cuttings a year are necessary.

sepal, while the white-tipped petals are also deep violet-blue at the base. Seeds are produced freely, and plants raised from them show less variation than in the case of many species—that is, if care be taken to prevent cross fertilisation by insects. *Stuartii* grows best in a moist, partly shaded situation, in strong loamy soil, with manure buried somewhat deeply during the digging. *H. W.*

LETTERS FROM JAPAN. III.

JUNIPERUS TAXIFOLIA ON BONIN ISLAND.

THE only Conifer on Bonin Island is the endemic *Juniperus taxifolia*, and why a *Juniperus* should be there is a mystery. But there it is, a perfectly distinct species, with small, polished chestnut brown fruits, the edges of the confluent scales glaucous. At one time this *Juniper* was a common tree on the island, and in the sheltered gullies, alongside of Palms and Tree Ferns, grew 50 feet high, with a trunk 6 feet in girth. Such

FIG. 50. JUNIPERUS TAXIFOLIA. SEEDS AND PETALS, VIOLET BLUE.

Seeds, introduced from Europe, were planted in Victoria, and, as well as mumps, spreading, causes disease in cattle. As a result of a River-wort competition in one district of Victoria, school children pulled up and burnt over two million plants and earned £507 by their beneficent work.

Mr. Davey, in conclusion, makes the wise suggestion that a knowledge of noxious weeds should be inculcated in school children by means of Nature Study lessons.

AQUILEGIA STUARTII.

AQUILEGIA STUARTII (see fig. 50) is one of the most attractive plants in this popular genus. It was raised by Dr. Stuart, of Chirnside, Scotland, in 1830, and first flowered with him in May, 1831. The result of a cross between *A. glandulosa* and *A. Witmannii*, it may be described as a much improved form of the first named species. It has proved to be a good perennial, improving each year with deep cultivation in rich soil. The flowers are large and handsome, with wide-spreading, violet blue

tree, no longer exist. The wood lasts in the ground and out longer than that of any other tree on the island, and in consequence all the larger trees have been felled and used for building purposes. The largest tree (and, indeed, the only large tree that I could find) was 45 feet tall - 4½ feet in girth of trunk. On the wind-swept hilltops this *Juniper* is reduced to a low, broad mat, and in this form and as a bush it is still abundant. As a tree, *J. taxifolia* is singularly handsome; old specimens would appear to be flat-topped, but the usual habit is loosely pyramidal with ascending, spreading branches; the branchlets are relatively long, slender, and always pendant, the leaves a light green, flat-tied subulate, obtuse, and have two stomatal lines. I gathered many specimens of this little-known plant, also ripe fruits, and took three photographs. The seeds I send under separate cover. Unfortunately, there is no likelihood of this *Juniper* proving hardy in the Arboretum, but in and around New Orleans it may grow, also in the warmer parts of California, and possibly in Cornwall and other favoured places. It is so beautiful a tree that it deserves a thorough trial. *E. H. Wilson.*

PHOENIX CANARIENSIS IN AUSTRALIA.

With reference to Mr. Turner's comment in *the Gardeners' Chronicle*, Vol. LX., p. 122, on a tree of *Phoenix canariensis* in the Garden Palace Grounds, Sydney, I may say that my statement was as follows:—"Its history is not very clear, but it is over thirty years old, and where it originally came from I cannot ascertain." I have since ascertained that the seed came from Kew during the directorship of Sir J. D. Hooker. Mr. Turner, however, writes that the seed came out during the directorship of Sir William Jackson Hooker, written at full length so that there shall be no mistake. Sir William, however, died in 1865.

Mr. Turner was employed on the gardening staff here for fourteen months in 1831, and Mr. James Camfield succeeded him, after an interval, as overseer of the Garden Palace Grounds (an integral part of the Botanic Gardens) at the beginning of 1832. Mr. Camfield continued in his duties until his death, on November 25 last.

It was my official duty for twenty years to inspect the grounds with Mr. Camfield, and this was done every week, and in some weeks much oftener. As I take a special interest in Palms, I usually included the Palm bed referred to in my inspection. Mr. Camfield told me that he planted most of the Palms, including this *P. canariensis*, and added that at the time its name was doubtful, which is borne out by the *Kew Bulletin* (1916), which states that the name was not used till 1842.

The name of the gardener (Mr. Camfield, and not Mr. Turner) who actually put the Phoenix in the ground out of the Botanic Garden nursery can have no interest for your readers, but I never raised the question.

Mr. Turner et al., that Mr. Charles Moore (my professor) gave him a free hand. This is another instance of a defective memory, for Mr. Moore was the most autocratic of men, and never was known to give anyone a free hand in anything. Mr. Turner, however, does himself less than justice by omitting to mention the assistance he gave Mrs. Macquarie in planting the Wishing-tree (*Araucaria excelsa*). *J. H. Maiden*

is still offered true in a seed list. Myatt's Pro 266 Ashleaf was raised a little earlier than R347. I had Magnum Bonum in 1876. Extra Early Veumont had a First-class Certificate in 1875; Snowflake had a similar award in 1874; Schoolmaster likewise in 1876; and Scotch Champion in 1879 it was extensively cultivated in the North before them. Vicar of Laleham and White Elephant had awards in 1881, and many others in cultivation then are still grown. *J. E.*

POTATO SNOWDROP.

I HAVE found this variety quite one of the best on this dry, sandy soil, both for cropping and its edible qualities. I well remember growing it in Wiltshire some years ago, when it was considered the best Potato for exhibition, but I had to discard it on account of its susceptibility to disease, especially in a wet season. This season we have had a rare crop on some woodland that has been cut and grubbed for kitchen garden crops. Last year it was fair though small, but its eating quality was good, and it lasted until January. I exhibited a dish some time since at an allotment show held in the town, and though there were some hundreds of dishes, none looked so beautiful as Snowdrop. *W. A. Cook, Abbot's Wood, Godalming.*

POTATO SPRAYING.

I WAS surprised to read the unfavourable experience of Mr. Harford on Potato spraying (see p. 122). Surely his experience is exceptional. Can anything have been wrong with the mixture used, and did the local Society spray with the Bordeaux mixture or the Burgundy mixture, as recommended by the Board of Agriculture. I am afraid much disappointment will be felt where the work was not done well. Growers are not altogether to blame, as in many instances spraying machines and chemicals came to hand late in the season, when the haulm had completely covered the ground, and in many cases was entangled. Rather than risk doing damage, in many cases the haulm merely was given a top spray, which was almost useless. When the growths get up to this size they must be carefully turned on one side, and after being well sprayed, turned back, and the other side treated similarly.

My experience is in direct contrast to your correspondent. I gave spraying a thorough trial by leaving two plots of separate varieties unsprayed and growing side by side with those sprayed. Only one spraying was given a thorough one with the Burgundy mixture. During the third and last weeks in July. The foliage of the unsprayed varieties was attacked by disease and it completely died down at the end of August, while the others were as green as a bed of Parsnips. The same thing happened on the farm, the difference being that only one variety *Arran Chief* was grown. There I also had a portion left unsprayed, and the dividing line could be seen a long way off.

The crops on the sprayed plots were splendid, with hardly a diseased tuber, and some individual roots weighed 40½ lbs. The unsprayed had quite a third of diseased tubers, and the loss would have been serious had it not been counterbalanced by the heavy crop already mentioned. *Arthur J. Cobb, The Gardens, Doffry, near Cardiff.*

BROAD BEANS.

To secure an early supply of Beans in the coming spring, make a sowing of Early Mazagan at the end of October. Select a site that is well drained and with a south aspect; sow in drills 5 inches deep and 3 feet apart. Protect the plants with litter if frosts are severe. Last year I sowed Early Longpod and Early Mazagan, but the former variety succumbed to the severe winter, whilst the latter, with protection, withstood the winter well. *C. Davis, Holly Well, Park Gardens, Ipswich.*

THE KITCHEN GARDEN

By J. DUNN, Foreman Royal Gardens, Windsor.

BEEF.—Nothing will be gained by leaving this crop in the ground after the roots are of sufficient size for use. Lift the roots carefully, taking care not to break or injure them in any way, or they will be of inferior quality when cooked. If stored in pits, a covering must be provided to ward off heavy rains; dry Fern will answer this purpose well. If shed room is available, they should be stored in sand.

CABBAGE.—A good plantation of Cabbage should be made to form the principal batch for spring and early summer supplies, for although the earlier plantations will prove useful, this planting must be regarded as the most important. Ground which has been occupied by spring-sown Onions or mid season Potatoes is suitable. If planted where Onions have been grown it will be necessary to fork the surface a few inches deep in order to destroy seedling weeds. The plants may be put out in rows 18 inches apart. As soon as growth commences, the hoe should be freely used during dry days, to keep the bed free from weeds during the winter. Slugs are very troublesome this season, and will require a good deal of attention during the autumn. There is no better deterrent to slugs than dusting the bed freely with lime in the early morning. Plants which remain in the seed bed after planting is finished should be transplanted on a sheltered border, as some may be required in spring to make good any that have failed or for making new plantations.

RADISHES.—A sowing of early Turnip-rooted Radish may be made thickly in a pit in rich soil that should be raised to within 15 inches of the roof glass.

CELERY.—Earthing-up should be proceeded with whenever the foliage is dry. Tie the leaves carefully together with some soft material and break the soil as finely as possible before placing it round the stems. After this work has been done the ties may be removed and used for the same purpose on successional beds. The latest batch of plants should be carefully examined at the roots, and if the soil is dry a good soaking of clear water may be given at least 24 hours before any soil is applied to the plants, and as this work is being done care must be taken that no soil reaches the heart of the plants, or diminished growth will result. In giving the final application of soil to early plants it should never be applied in sufficient quantities to have a choking effect on them.

ENDIVE.—Continue to plant Endive until every available pit is filled. The bed should be enriched by mixing some decayed manure with the soil so that quick, clean growth may result. Allow 9 inches between the plants each way and stir the surface soil as often as possible when once the plants have become established. The lights should be left off the pit until severe frosts or heavy rains are expected.

LETTUCE.—Plants of Lettuce should be lifted carefully from the open garden and placed in cold pits to make certain of a supply during the winter. Those which are not too far advanced should be selected, and the lights left off the pit until protection from frost or rains is required. Ventilation must be freely applied in favourable weather during winter.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate.

ODONTOGLOSSUMS have been benefited by the cool, damp nights, and the plants should be developing vigorous growths. The houses in which they are grown should be ventilated carefully at this season, air being admitted through the bottom ventilators at all times, according to the outside temperature. During warm

ON INCREASED FOOD PRODUCTION.

DEGENERATION OF POTATOS.

I HAVE been greatly interested in this discussi on (pp. 100, 122 and 132), but nothing has struck me more forcibly than the sentence:—"I see no reason why, given good treatment, a Potato should not go on for ever" (p. 122). The late blight, or *Phytophthora infestans*, has been carried all over the world by means of mycelium liberating in the tubers. *Macrosporium Solani* (Potato Leaf curl) has been carried about in a similar way. Once infested, the old tubers communicate these diseases to their offspring, and no one can see what is inside tubers when planting them. When old varieties of Potatos are said to be improved, selected, or the tendency to disease eliminated, this can only mean that someone has worked in a fresh stock in which no disease is present. Except in the case of a possible sport, none of these improved Potatos can be anything else than a healthy stock of the old origin. Just how many years a Potato may be considered worth growing depends upon how long it can be kept healthy and productive. It may, of course, get superseded by a modern and more profitable one of a similar type. The point of the sentence quoted above is whether or not a given variety of Pot to could be grown indefinitely. That has not been proved, but science and practice might contrive to do it. There are some very old ones still in existence, of which I would like to mention a few. The Old Ashleaf

nights the top ventilators may be opened slightly to admit the dew, which is very beneficial to *Odonotoglossums*, especially those that have been lately re-potted.

CATTLEYA AND LAELIA.—Report plants of *C. gigas* and *C. Hardyana* that have passed out of flower, together with such *Laelias* as *L. tenebrosa*, *L. purpurata*, and its hybrid, *L. C. Canhamiana*, and others that have commenced to make their young growths, and are pushing forth roots from their base. In re-potting, after removing the plant from the pot, the old, useless pseudo-bulbs, especially those that have no leaves, should be cut away, also the decayed roots. The plants should then be placed in receptacles of sufficient size to accommodate them for the next two seasons. Pots which are to contain moderate-sized plants should be filled to about one-half their depth with clean crocks, whilst for larger specimens a greater depth of drainage should be used, and less potting material. Keep the rhizome of the plant just below the rim of the pot, and press the compost firmly among the roots.

Plants of *Laelia* which have recently passed out of bloom should be dealt with in a similar manner. Such Cattleyas as *C. Mendilli*, *C. Mossiae*, *C. Trianae* and *C. Schroderae* that have grown too large for their pots, and are producing roots from the base of the youngest pseudo-bulb, may be afforded more rooting space, but care must be taken not to disturb the roots any more than is unavoidable; do not pull the plants from their pots, but break these latter and carefully remove the pieces, and without disturbing the drainage or roots place the whole into a pot of suitable size, fill in the drainage space with clean crocks, and fill in round the ball of the plant with new compost. A suitable rooting medium for all the above-named plants will be found in equal parts of A 1 fibre and *Osmunda* fibre, cut up rather roughly, a little chopped *Sphagnum* moss, and crushed crocks. After they are re-potted, the plants should be afforded only sufficient water at the pots to prevent shrivelling, for if the compost is not continually damp at this period the plants will commence to grow instead of taking their proper season of rest. I do not advocate any re-potting of the general collection of Cattleyas, *Laelias*, and hybrids at this time of the year, but where many of these plants are grown they are not all ready to be dealt with at the same time. Re-potting should be done when it is seen that new roots are emerging from the base of the pseudo-bulbs or leading sprouts. It often happens that at this season of the year the outer covering of the pseudo-bulbs has become damp and discoloured, and may cause the bulb to decay. When this is observed, increase the ventilation of the house, even if it becomes necessary to employ more artificial heat. Give as much light as possible for a few days, and keep such plants rather dry at the roots; also reduce the atmospheric moisture. Two agencies, light and air, when properly balanced, are the best means we have to produce solidity in the pseudo-bulbs. The Cattleyas which flower in the autumn, such as *Cattleya Boverianorum* and such of its hybrids as *C. Martini*, *C. Mes. L. W. Whiteley*, *C. Browniae*, *C. Wendlandii* and *C. Parlati*, should be kept rather dry at the roots, until the flower-stalks are observed pushing up at the base of the sheaths, when a slight increase of water may be allowed, the supply to be again reduced when the flowers have expanded.

THE HARDY FRUIT GARDEN

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVY, Abbots Wood, Grafting, Surrey.

ORCHARD TREES.—Large, highly coloured fruits are generally obtained from the tops of large standard trees, and they should be left as long as possible to thoroughly ripen. The finest specimens of Blenheim Pippin, Ribston Pippin, King of the Pippins, and Cox's Orange Pippin, are to be found usually in these positions. Apples that are now being gathered should be selected, and for convenience of storing may be placed in boxes or tubs and stored in dry places. Small, badly formed fruits should be disposed of in some other way, and small, worthless varieties should be discarded, the roots grubbed up, and good varieties

substituted, or the old trees re-grafted. Be careful to select varieties that succeed best in the district. Newton Wonder is a large and weighty fruit that should be given extended cultivation, being good in colour and capable of being kept in excellent condition for a long period. Rev. W. Wilks should be added to the list. Dumbley's Seedling (Wellington) is still one of the very best, and is, moreover, a great bearer, and second to none for culinary uses from December to April. Annie Elizabeth is a great bearer, and keeps in condition till May when well ripened and stored.

RIPE STRAWBERRIES.—These should be covered with hand lights or given other protection, as with the showery weather they soon suffer.

LIFTING AND ROOT PRUNING OF FRUIT TREES.—Proceed with these operations as opportunities occur. The earlier they are accomplished the better chance will the trees be given to make fibrous roots quickly.

HARDY VINES COVERING BUILDINGS.—Any loose or growing laterals on hardy vines should be removed, and where there are Grapes ripening it is the more essential in order to allow the sun's rays to reach the bunches.

FRUITS UNDER GLASS.

By JAS. HUDSON, Head Gardener at Ginnethsury House, Axon, W.

THE POTTING OF FRUIT TREES.—No time should now be lost before re-potting or thoroughly dressing the trees. With the exception of one instance only I have always reported them annually, which is a sufficient indication of my belief in this method of cultivation during a period of more than twenty years. The pottings should be done under cover, so that there will be no hindrance to the work. I used to erect a temporary shelter with a tarpaulin, but in recent years I have had an opportunity of doing this work under glass, which is much better. Prepare a sufficient number of pots beforehand. Allow for a few trees being put into larger pots, but only those that actually need them. As the work of knocking out proceeds, let the empty pots be washed and well dried before they are again used.

THE POTTING PROCESS.—When a knocked out of the pot, an idea can be formed by the state of the roots and of the growth of the tree if a larger pot is required, but do not be too generous in this extension of root room. When the tree is free of its pot, proceed by removing the ball of soil round in an equal degree, removing also the surface or top soil, and the top dressing, as well as the bottom next to the crocks in the new soil to allow of a good amount of rough, fairly soil to be put over the crocks. Let this be well rammed down, and then add just a little soil and place the tree therein, making allowance for a fairly good surface dressing, and for sufficient depth for watering. As a rule, my plan is to reduce the ball sufficiently for the hand to be worked easily around the ball when the tree is put into its fresh pot; this is a good guide to follow as to the amount of old ball to be removed. When the roots are very plentiful, and it is not an easy matter to reduce the ball, then a larger pot may be used. If the trees have been plunged since they were taken inside after fruiting, a good number of surface roots will have developed. These should be preserved, spread out evenly, and just covered with soil. While pottling is in process, let the soil be well rammed, only adding a little at a time. I firmly believe in hard or solid pottling.

AFTER TREATMENT.—After pottling, keep the trees under cover if possible, and use the syringe freely for a few weeks. Give the roots one or two good soakings at once, and never let the soil get dry. In only a few instances have I observed any shrivelling of the wood after pottling. For reducing the ball we used searchers made like a fork with two points, these are laid at right angles with about 2 inches turned over. Three runners are needed, one of obtuse shape, one fairly thick, and one thin for tight places. As to the soil, I described its preparation in the notes published in these pages on September 22.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Normwicks, Eastwell Park, Kent.

VIOLETS IN POTS.—These are usually great favourites, as good plants may be taken in the dwelling-house for a few days. When lifting the plants from the border a batch should be selected for potting up. Choose healthy and compact plants, with good, firm crowns, and put up in 2½ or 3 inch pots, according to the size and variety preferred. The treatment advised is exactly the same as for those planted in a frame, but as the weather gets colder the pot plants may be brought in and placed on a shelf or stage in the greenhouse. A few plants will perfume the house or conservatory, and their fragrance is always appreciated. The best varieties are La France, Princess of Wales, and Admiral Acland for singles, whilst Marie Louise, Lady Home Campbell, Mrs. Astor, and Mrs. Arthur are first class double varieties.

LATE FUCHSIAS.—Fuchsia plants in full bloom must be kept well supplied with water and liquid manure, or be given a pinch of artificial plant food occasionally. Pinch off the old blooms before seed forms. Fuchsias grown as standards are particularly well adapted for greenhouse and conservatory decoration, supplying the requisite height for artistic grouping.

PROPAGATING YOUNG STOCK.—To ensure a batch of young Fuchsias for flowering early next season, cuttings may be taken now, and inserted in pots or pans of light, sandy soil, which should be placed in the propagating pit. When nicely rooted, pot them into 3 inch pots, and keep them on a shelf near the glass in an intermediate house all winter.

THE FLOWER GARDEN.

By W. J. GRICE, Gardener to Mrs. DUMPER, Keele Hall, Staffordshire.

TRANSPLANTING VIOLETS.—Transfer Violets from the open ground to frames with a south aspect. Some surplus plants were planted in a vegetable frame last year in these gardens, and beyond giving them a light dusting of fertiliser tacked into the soil they gave us no further trouble. The plants flowered profusely. Frames that have been used for Melons or Cucumbers are quite suitable for Violets. Remove the old soil, thoroughly wash the glass and woodwork inside and out, and lime with the walls. Prepare a fresh bed 12 inches deep of stable litter and leaves, covering it to a depth of 3 inches with a compost of loam, leaf-mould, manure, sand, and a little soot, mixing the ingredients thoroughly together. The bed should be brought up close to the glass as will just allow room for the foliage. Give the plants a liberal watering before hitting them if the soil is at all dry, and syringe the foliage with an insecticide. Lift each plant with a good ball of soil, pick off all runners, and plant firmly 9 inches to 12 inches apart. Apply water freely through a coarse rose to settle the soil directly the frame is planted. Keep the frame closed for a week or ten days, and apply a light shading during bright weather. When the plants are established air must be admitted on favourable occasions, for any attempt at forcing will result merely in leaf growth. Mats or other protecting material should be in readiness to place over the glass during frosty weather.

SWEET PEAS.—In favourable districts a sowing of Sweet Peas may be made for flowering out of doors in June. In other districts the best method is to raise the plants in a cold frame or greenhouse. Sow the seeds very thinly in pots, boxes, or trays. Water very carefully during the winter months, and admit air in favourable weather. If the plants are given cool treatment it should not be necessary to pinch the leading shoots.

PINKS.—Transfer Pinks that were rooted in frames into their permanent positions or reserve quarters. Prepare the beds at once, make the soil firm, and plant about 6 inches apart each way. They should be firmly planted and watered through a rose to settle the soil. It is well to plant some in the herbaceous or mixed borders, in groups of five.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would oblige by delaying in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, OCTOBER 9—

R.H.S. COMPETITIVE Exhibition of British-grown Fruits, at the Drill Hall, Buckingham Gate, Westminster.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 53.6.

ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, October 4, 10 a.m.—Bar, 29.0, temp, 62.0; Weather Rain.

SALES FOR THE ENSUING WEEK.

MONDAY—

Bulls, at 67 and 68, Cheapside, at 1 o'clock, by Protheroe & Morris.

WEDNESDAY—

Trade Sale of Bulls, at 67 and 68, Cheapside, at 1 o'clock, by Protheroe & Morris.

FRIDAY—

Bulls, at Protheroe & Morris' rooms at 1 o'clock.

The latest reports* from America indicate that Vegetable Seed Supplies.

present year has not been favourable to seed production, owing to the weather having been too wet. Naturally, in so large an area the seed crops show large variations. California, which is, of course, one of the greatest seed-producing regions, has suffered from hot winds, and the embarrassments of seed growers there have been increased—as has been the case in this country—by the difficulty experienced in obtaining sufficient acreage for seed growing. The high prices obtaining for cereals and the requirements of the canning factories have introduced new competition, and have naturally made seed raising more expensive. It is noteworthy, also, that our own special difficulty—shortage of labour—has already been felt severely by American seed growers. According to the preliminary reports received by the *Seed World*, Californian Onions will yield

a 60-75 per cent. crop (the report of this crop from the Canary Islands is, however, favourable, and a full harvest is expected); Californian-grown Lettuce, 80-90 per cent., and Spinach, from 10 to 20 per cent.

The reports from seed growers in Washington are dismal reading. Over 40,000 acres of Peas were grown, but the crop is extremely poor. Better prospects are reported from the Colorado district, where Beans, Spinach, Onions, and Turnips are grown for seed. Beans in Michigan are not expected to give more than 10 bushels per acre, and reports of the Pea crop indicate half to three-quarters of a crop.

The reports received from Denmark show that the severe winter and unfavourable spring weather have affected adversely the biennials grown for seed in that country. Cabbage is far below the average, and so also are Mangels and Turnips. It is said that it is doubtful whether any Cabbage seed will be exported. Cauliflower is about 60 per cent. of the average, and prices generally are high. The *Seed World* concludes from its investigations that the seed supply of the United States will be the shortest ever experienced.

So far as this country is concerned, there will be need for the strictest economy in the use of vegetable seeds. The wholesale trade may be relied upon to do everything that is possible to provide adequate supplies. Their industry is one that at all times demands the largest measure of provision, but present circumstances are extraordinarily difficult, and it behoves everyone to exercise the greatest economy in the use of vegetable seeds, for otherwise it will not be possible to provide the seed for the sowing of the yet larger acreages of garden vegetables which should be grown during the coming year. The Food Production Department is issuing a leaflet on economy in the use of vegetable seeds, and it is greatly to be hoped that everyone who cultivates garden ground will see to it that the seeds which he sows are made to go as far as possible.

Spencer Cupid Sweet Peas.

An interesting and successful application of Mendelian principles to a specific practical problem was recently laid before the Scientific Committee of the R.H.S. by Mr. George T. Dickson, of Newtownards. Mr. Dickson's object was to produce a race of Sweet Peas combining the dwarfness of the Cupid grandiflora type with the Spencer flower as borne by a tall parent. Instead of contenting himself with the old-fashioned hit-and-miss method, Mr. Dickson worked out for himself a scheme of probabilities, based on what is known as Mendelian expectation. Assuming—as he had good reason for doing—that tallness would prove dominant to dwarfness and the grandiflora type of flower would be dominant to the Spencer type, Mr. Dickson was prepared to expect that by crossing a tall Spencer with a dwarf (Cupid) grandiflora-flowered plant

he would obtain an F_1 hybrid of the ostensible form of a tall grandiflora. The cross was effected with some difficulty—only one in 130 pollinations proving successful. The F_1 hybrid fulfilled expectations in manifesting the two dominant characters of "tallness" and "grandiflora-floweredness." But instead of giving up his experiment because of its apparent lack of success in the first generation, Mr. Dickson was encouraged by his knowledge of Mendelism to continue it for another generation. Reasoning that the F_1 hybrid, although resembling only one of its two parents in each of the characters under consideration, must also be carrying in its germ cells the opposing characters (of dwarfness and Spencer-flower), Mr. Dickson was able to predict that by crossing the F_1 hybrids together he would obtain on the average in one of every sixteen members of the F_2 generation a plant of dwarf stature and with flowers of Spencer form. Experiment verified the prediction, and thus Mr. Dickson succeeded not only in demonstrating the usefulness of Mendelism as an aid to practical plant-breeding, but also in raising a charming and dainty race of Sweet Peas—the Spencer Cupids.

In recognition of the value of this work the Scientific Committee has awarded a Certificate of Appreciation to Mr. Dickson.

SIR FRANK CRISP, BART.—It is announced that the Borough Council of Henley-on-Thames has decided to confer the freedom of the borough on Sir FRANK CRISP, whose residence, Friar Park, is situated close to the town.

R.H.S. FRUIT SHOW.—The Royal Horticultural Society's annual competitive fruit show will be held on Tuesday next, the 9th inst., in the Drill Hall, Buckingham Gate, Westminster. Members of the Fruit and Vegetable Committee will meet at 12.30 p.m. to adjudicate on novelties. None of the other committees will meet on this occasion.

SUPPLIES OF BASIC SLAG.—We regret that in the paragraph on the fixed prices of basic slag published in our last issue (see p. 151), a portion of the letterpress was accidentally omitted, the result being that the additional charges for smaller quantities than 4 tons were given as full prices. It should be understood that these latter vary according to the percentage of phosphates contained in the samples, the lowest being 44s. and the highest 80s. per ton.

DUTCH BULBS.—According to statements in the U.S. Horticultural Press an embargo has been placed on the export of Dutch bulbs. The *Florists' Exchange* computes the average yearly importation of Dutch bulbs at 35,000 to 40,000 cases. One consignment of 12,000 cases is apparently all that is likely to reach the United States.

THE POTATO-DEALERS' REGISTER.—The Food Controller announces that the last day on which wholesale dealers and retail dealers in Potatoes may apply for registration has been postponed from October 1 to October 8. Forms of application may be obtained from the local food office for the area in which the dealer's premises are situated.

KINVER EDGE, WORDSLEY.—Those who have visited the seed trial grounds of Messrs. EDWARD WEBB AND SONS, which are situated at Wordsley, in Staffordshire, will remember the beautiful eminence known as Kinver Edge, a short distance from the nurseries. It is always a surprise to visitors to find such a beautiful

* *The Seed World*, Chicago, Sept. 5, 1917.

spot within so short a distance of the heart of the Black Country. Kewer Edge has now been presented by the family of the late Mr. THOMAS GOSVENOR LEE, of Birmingham, to the National Trust, to be held for the use of the public. This magnificent gift comprises some two hundred acres of heathery moor, which will be much appreciated, and will serve to keep green the memory of the famous naturalist. At a public celebration of the gift on September 20, Canon BAWNSLEY, the chairman of the Trust, formally accepted the gift, and Lord DARTMOUTH and the Mayor of STORRBRIDGE, made speeches congratulating the Trust on the acquisition of its first piece of property in the heart of the Midlands.

FOUR VETERAN GARDENERS.—We reproduce in fig. 51 an interesting photograph of four veteran gardeners, Messrs. H. BALSANINE, T. ROBINSO, J. JEMMIE, and A. SINGHAR, taken recently in the garden of Mr. BALSANINE at Westwood, Elham, where he now resides. Each of these four gardeners is over eighty years of age, and their combined ages amount to 356 years. Mr. BALSANINE was born in 1835, and began his gardening career in Scotland. Whilst a young man he was apprenticed to a brewer and barliff at "The Dell," Baron Sinton's residence at Englefield Green. Here he stayed for nearly half a century, and the late Baron, who esteemed him very highly, on his death left BALSANINE a legacy of one thousand pounds. He was a keen and successful Orchid grower, and was for twenty-five years a member of the R.H.S. Orchid Committee. In 1907 he was presented with the Victoria Medal of Honour, and in 1911 he retired from "The Dell" appointment. Some particulars of his career, and a portrait, were published in *Gard. Chron.*, Sept. 14, 1907, and his retirement is more fully dealt in the issue for April 1, 1911. Mr. T. ROBINSO was born in 1835. His experience was chiefly gained in the south of England, but his last post as head gardener was at Marlborough Park, Cork. Later he was for twenty-one years gardener and barliff at the Royal Indian Engineering College, Cooper's Hill, and retired in 1890. Mr. J. JEMMIE is the eldest of the party group, having been born in 1831. He is still in harness and has never been absent from work for a day through illness, being lame and hoarse. For the last fifty-six years he has held the post of gardener at Milton Park, Elham, where he has served three generations of Barons de Wormes. Mr. A. SINGHAR is 18 years younger than Mr. JEMMIE. He began work at the age of 22, and has had a very varied experience, having served in gardens as far north as Banff. His last position was that of head gardener to R. CHAMBERSON, Esq., at Hamble House, Wares, where he remained for fifty-one years, retiring in 1909.

POTATO GROWER FINED £300.—At Walsby Police Court, recently GEORGE TAYLOR, a Potato grower, was fined £300 on the grounds of having sold seed Potatoes at prices above the maximum. The excess profit was £10. He pleaded that the Government had commandeered 957 tons of his Potatoes at 2s. a ton, while his neighbours had obtained 4.11 a ton on the market.

MEDLAR SEEDS AS POULTRY FOOD. It is not generally known (states the *Journal of the Royal Society of Arts*) that the seeds of the Japanese Medlar (*Eriobotrya japonica*), a tree which is grown for its fruit on the French Riviera, can be used for feeding poultry, rabbits, and other domestic animals. They can also be used for distilling a spirit resembling Kirschwasser. Food for poultry can be prepared by simply boiling the fresh or dried seeds in water for thirty to forty-five minutes, and then crushing them or using them whole, as may be desired; or, instead of being boiled, they may be roasted like coffee. Another plan, which has the advantage of not requiring heat, is to crush the seeds, then moisten them with suffi-

cient water, and allow them to remain in this state for twelve hours. The mass is spread out in a thin layer to dry in the sun, in order to remove any traces of the bitter flavour. This poultry food can be used dry or wet as preferred.

SOIL BACTERIA. During the past eight years Mr. H. JOEL COSS has been engaged in the very difficult and important work of studying the bacterial flora of the soil. "Our knowledge of the bacterial content of the soil progresses very slowly, and this because of the fact that it is a new branch of science. The organisms have to be isolated and cultivated. Many of them are new and not easy of cultivation under artificial conditions. The soil bacteria are of two types; those which form spores and those which do not. The former are relatively few in number, and are probably not of agricultural importance, since they appear to occur in the soil only in their spore—or resting—stage. The non-spore, or, on the other hand, occur in great number and variety, increase amazingly when the soil is

HISTORIC FIRM.

WITH some notable exceptions British seed firms have been more or less short-lived. They have flourished for periods of varying brevity, but few have continued successful for more than a century. That being the case, it is cheering to find an exception in the case of a firm which is known, not only throughout Scotland, but also throughout the whole of the United Kingdom—that of Messrs. Austin and McAslan, of Glasgow. The bicentenary of the firm was celebrated on the 28th ult. by a dinner in the Trades Hall, Glassford Street, Glasgow, at which a numerous and representative company was present. The chair was occupied by Mr. Alexander N. Hunter, the present head of the firm, and the guests numbered about one hundred and fifty. The Lord Provost and other important townspeople were present, and Sir Robert Wright, the chairman of the Board of Agriculture for Scotland. Representing the staff of Messrs.

FIG. 51. FOUR VETERAN GARDENERS. From left to right, H. Balsanine, T. Robins, J. Jemmie, and A. Singhar.

cient water, and it is when it is agitated. Some of them are known to be ammonifiers—that is, producers of ammonia. As an example of the effect of aeration in the bacterial population of the soil, Mr. COSS mentions that whereas 1 gram about 15 grams of dry soil yielded about 10 million colonies of a similar amount of the same soil yielded after aeration about 20 million colonies. It will evidently be a long while before we shall be able to purchase soil fertility factors in stores, which, added to soil, will infallibly set going those beneficent processes of corruption, and those only whereby the food and abundant necessary for perfect vegetable growth are produced. Yet it does not require much vision to see the agriculture and horticulture of the future employing the bacteria of the soil in as sure and beneficial a manner as the dairyman now employs cultures of microorganisms to act as starters in producing the kind of cheese he wants.

Austin and McAslan were Messrs. John Cairns, R. M. Young, S. G. Smith and J. J. Robertson. The following represented the garden and agricultural seed trade and nursery trade: W. Cuthbertson (Dobbie and Co., Edinburgh), J. M. Bridgford (Watkins and Simpson, Ltd., London), A. W. Johnson (Hurst and Son, London), Andrew Aitken (Chas. Sharpe and Co., Ltd., Stamford), T. S. Findlay (Findlay Bros., Barlingston), Joseph Dobson (Wm. Leighton, Glasgow), T. B. B. Kerr (Kerr and Co., Glasgow), James Gray (Glasgow), W. P. Maltman (Alex. Cross and Sons, Glasgow), James McKenzie (Glasgow), Andrew Matherwell (Glasgow), T. C. Meldrum (Smith and Meldrum, Forfar), John Sutherland (Lenzie), John Smellie (Busby), Thos. Jeffrey (Edinburgh), Chas. Young (Kennohead), Thos. Thomson (John Donaldson and Co., Edinburgh), J. D. Alexander (Pringle and Alexander, Glasgow), R. W. Todd (Danlop and Todd, Glasgow), Robt. Howie (Glasgow), W. Gilchrist (W. Gilchrist and Sons, Glasgow), P. M. Hamilton (Arch Hamilton and Sons,

* *Soil Flora Studies*. Pails No. 57, 58, and 59, New York Agric. Exp. Station, Geneva, N.Y.

(Glasgow), Andrew Giffen (Glasgow), John Hughes (Dunlop), Wm. White (James Gray and Co., Stirling), John Gray (James Gray and Co., Stirling), James Ramsay (Helenburgh), Andrew Dewar (Cartshore and Sons, Stirling), J. W. Cook (Cook and Blair, Greenock), W. S. Newton (Saxnor, Cooke and Ridal, Sheffield), J. S. Soutar (Ransomes, Sims and Jeffries, Ipswich); J. S. Brunton (*Horticultural Trade Journals*), John Yuille (*Glasgow Citizen*), James Cameron (*Glasgow Herald*); G. W. McHattie (representing the Royal Caledonian Horticultural Society), H. M. Mackie (representing the Glasgow and West of Scotland Horticultural Society), Wm. Strang (representing the Glasgow Agricultural Society).

The toast of the evening was "Austin and McAslan," which was proposed by the Lord Provost and replied to by the host. There were a number of other toasts, and the evening concluded by the singing of "Auld Lang Syne."

This event is full of interest, in that, as we have hinted above, it is practically unique in the history of the British seed trade. It seems a pity that there is extant no historical record of this most absorbing of trades, and of all the vicissitudes through which it has passed. We fear that, at this late date, anyone who took on such a task would find it overwhelmingly difficult, owing to the scattered nature, or indeed, in many cases, the total absence of material.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PICEA PUNGENS GLAUCA.—I enclose a photograph (see fig. 52) of a very fine specimen of *Picea pungens glauca* in the gardens of this college. The tree originally came from the nurseries of Messrs. Dicksons, Ltd.; it is 35 feet high, and the spread of branches at base has a circumference of 44 feet. (*Miss Evelyn Lucas, Horticultural College, Chester.*)

ACETIC ACID AS AN INSECTICIDE.—A distinguished chemist of my acquaintance tells me that acetic acid or vinegar is a powerful insecticide, and that it will get rid of white fly and aphid generally from greenhouses. The acid is put in a small enamelled kitchen pan, and is volatilised by means of a spirit lamp—the house, of course, being kept closed during the fumigation. I write to inquire whether this apparently simple remedy is generally known, and whether, if it has been tried, it has proved as efficacious as my informant believes it to be? J. N.

INDIAN AZALEA IN DERBYSHIRE.—The accompanying photograph (see fig. 53) of my white single-flowered Azalea (*Rhododendron indicum*) in flower was taken on June 8 last. This plant has been out of doors in this garden for seven years, with no protection at all in winter, yet even last winter it looked green and happy all the time. I moved it from its original east border three years ago, but it has thriven equally in either situation. Derbyshire is supposed to be a cold county, and here we are over 500 feet above the sea, so I think the single-flowered Azalea has fairly earned a place among hardy plants—especially as I have several others also out of doors, but not so big and old. W. Arkwright, Sutton Seeds, dale, Chesterfield.

TOWN-PLANNING AND ALLOTMENTS.—Mainly through the practical assistance of the Food Production Department great help has been given to allotment holders, and their holdings have been rendered more secure, at all events until after the war. But the advantages in many cases only extend until the owners of the land to be used for building purposes require the sites to carry out their plans. The use of allotments, with their pleasures and profits in food production during the war, has made the holders keen on getting more permanent arrangements whereby they may enjoy as concessions. Groups of local authorities around London and in other parts are now busy in preparing town-planning schemes under which all the property owners

in their district are concerned, and it should now pass into law that no scheme for the development of groups of dwelling-houses should be passed by the superior authorities to whom they have to be submitted unless a proportionate area for allotment gardens be embodied. The portion so assigned should be purchasable by the local authority at a price based on its value as agricultural land as shown by the assessment, or the original cost to the owner, and not at its

main roads and other sanitary arrangements, might well be modified with advantage. But to get back to the land. The allotment gardener and smallholder has now got something of the gardening facilities which he has been craving for a long time, and it will be his own fault if he does not get still better things by law and right. The local authorities are always anxious to do their part, but the laws under which they may acquire land only by showing that they can make it pay as allotments render them powerless. The higher authorities must see to it. James O'Brien, Harrow-on-the-Hill.

SEEDLINGS OF MORISIA.—Sir Herbert Maxwell's experience of the seeding propensities of *Morisia hypogaea* quite accords with my own. The plants, which are growing in full sun on a south-facing bed of granite chippings and soil of a considerable depth, seed very freely every year, and amongst the older plants there are now, as in previous years, a large number of seedlings, which, as he observes, may easily be mistaken by the unwary for *Grondsel*. Whenever I have grown the plants under what might be described as hard and superficially dry conditions seedlings in rather large numbers are to be found at the beginning of the autumn. I am convinced that many people grow this plant in too rich a soil, when it either fails to ripen seed, or the seedlings damp off. J. B. F.

NYMPHAEA STELLATA.—A pot of this blue Water Lily ("Berlin" variety) was left out in a lead tank here last winter. The tank has about 3 feet of water in it, and was frozen over to a depth of about 6 inches for several weeks. During the summer leaves appeared, and now (September) it is in flower. The plant has not been disturbed since it was placed in the tank about 18 months ago. I am informed that this Lily has not usually been considered hardy enough to withstand a winter in this country. Gerald Leder, Walkhurst Place, Sussex.

ORDERS OF THE ROYAL COMMISSION ON PAPER AND SEEDSMEN'S CATALOGUES.—In March last the Royal Commission on Paper issued an Order under the terms of which tradesmen's catalogues, price lists, or advertising circulars could be sent out only in response to direct applications for such catalogues, etc. On March 12 a representative meeting of members of the seed trade was held, and a committee appointed, of which I was asked to act as chairman. As a result of several meetings of the committee, and correspondence and interviews with the Paper Commission, a very valuable concession was made on May 15, by which the distribution of seedsmen's catalogues was permitted by the Commission during the present year on condition that not more than 50 per cent., whether in number or in weight, of the catalogues distributed in the year 1914 were sent out, and that the catalogues contained the offer of "Food Product" seeds only. Subsequently, on August 20, a further Order, which revoked the earlier Order, was issued by the Paper Commission, granting licence for the issue and despatch of tradesmen's catalogues, price lists, and advertising circulars, between the date of this licence and January 31, 1918, to the extent of one-third of the weight of paper used for such catalogues, etc., between August 1, 1916, and January 31, 1917. The situation thus raised was so serious that an interview was at once arranged with the Paper Commission. As a result of subsequent interviews and correspondence, the Commission has now definitely declared that seed merchants may still avail themselves of the special concession granted in May last for the issue, without application, of 50 per cent. of the weight of catalogues sent out in the season 1915-14, provided that such catalogues refer exclusively to "Food Product" seeds, and has asked me, as chairman of the Trade Committee, to communicate this decision to the members of the seed trade. It is therefore now open to seedsmen either to send out combined catalogues of vegetable seeds, flower seeds, etc., as formerly, but using only one-third of the paper utilised between August 1, 1916, and January 31, 1917, or else to divide their catalogues into two parts, and thus make use of the 50 per cent. concession for catalogues of "Food Product" seeds, in addition to the one-third allowance for other catalogues. The Paper Commission, in response to my appeal, will not now place a limit

FIG. 52.—*PICEA PUNGENS GLAUCA* AT CHESTER HORTICULTURAL COLLEGE.

estimated value is building land. It may be said that this would press heavily on the owner on whose property the selected land for allotments was situated, but that might easily be met, for all the owners included in a town-planning scheme to which they have consented have a common interest, and could contribute *pro rata* the difference between the lower price coming to the owner of the ground taken for allotment

FIG. 53.—*AZALEA INDICA* IN THE GARDENS AT SUTTON SEASDALE, DERBYSHIRE.

gardens and its value as building land, which they were about to test. Furthermore, as a concession to the interests of the estate owners for land set aside for open spaces and allotments, the local authorities should be empowered to relax some of the more or less non-essential building byelaws, and especially clauses relating to the open spaces in front and rear of domestic buildings which, under town-planning schemes, with their broad

on the number of catalogues issued, provided that the weight of paper does not exceed 50 per cent. of that used in the year 1915/16 in the case of catalogues of "Food Product" seeds, or 55 per cent. of the weight of paper used between August 1, 1916, and January 31, 1917, in the case of all other catalogues. But it is definitely laid down that catalogues issued under those concessions must include the total number sent out, whether in response to applications or without application. The Commission has agreed that catalogues of "Food Product" seeds may include the offer of grass seeds, and also of garden sundries.

— P.S.—The chairman of the Royal Commission on Paper received a deputation from the Seed Trade Committee on September 28, and, after very full and sympathetic consideration given to points raised by the deputation, the following official ruling was given:—The recent Order of the Paper Commission relating to all catalogues issued between August 20, 1917, and January 31, 1918, shall not be deemed to apply to any catalogues for bulbs, nursery stock, seeds, etc., which had been printed before the date of the Order (August 20, 1917) but had been sent out since that date. Any balance of the catalogues so prepared and printed which may have been reserved for issue to customers, and which have not yet been sent out, must now be deemed as coming within the recent Order of the Paper Commission dated August 20, 1917, and the weight of such catalogues must consequently be included in the weight specified in the recent Order affecting all catalogues issued between August 20, 1917, and January 31, 1918. Catalogues containing the offer of "Food Product" seeds exclusively are still covered by the concession of May 15 last as explained in my letter to you of September 25. I may also mention that the secretary of the Paper Commission, after writing to the secretary of the Horticultural Trades' Association on September 29, 1917, stated:—"Catalogues of flower seeds fall within the conditions of the general licence of August 20, 1917, a copy of which is enclosed herewith, and in the case of catalogues containing both food and flower seeds the proportion of an *all printed matter* must be observed at least at one." Arthur W. Sutton.

APPLES IN EAST LOTHIAN (see p. 111).—When I stated on p. 52, that the Apple crop in East Lothian was under the average, that, of course, referred to the crop as a whole, some trees being heavily cropped, though in a neighbouring garden, I am told, there is no fruit at all. A feature of some trees which is rather uncommon, as far as concern fruit, every blossom having set instead of only one or two, which is usual. Red Astrachan is very fine here, as well as in Mr. Taylor's garden, the fruits measuring 9 inches round and beautifully coloured, but this variety crops only once in ten years, and then gives mispud fruits. Neither is Duchess of Oldenburg, worth a place in any save large collections. Mr. Taylor is correct in assuming the existence and cultivation of more than one variety of James Grieve. Our trees came from the raiser, and the variety is a consistent cropper, yielding fine Apples. The green grown Cadross Green some 35 years, but would not esteem it equal to Stirling Castle. It has, perhaps, carried two full crops in that period, and it keeps much longer than the variety first named. The Apple trees here, though in high time, are really equal to cordons, the number of branches being limited to only as many as leaves them fully exposed. Bezug to the exact question of trees on grass, I do not find, as I have before stated, that fruit is smaller from trees on grass than on trees on cultivated land. Red Astrachan is a case in point. Our largest fruits are from trees on grass, also in the case of Warner's King, Ribston Pippin, King of the Pippins, and others. Since Apples had grass grown on the border in which they are rooted, the trees have been much healthier, and there has been no deterioration in the fruit. The same is true of Peas. It is not remarkable, notwithstanding the quantities of Apples grown in Great Britain and Ireland, that dealers should anticipate a famine two months hence? I have had hitherto no difficulty in maintaining a regular supply up to May. It has been explained that

orchardists in the past have rushed early and late varieties on the market previous to supplies from America arriving, and I have frequently seen in September and October varieties that are at their best in March and April exposed for sale. "Cannot these be kept back this season?" R. P. Brotherton.

ABSENCE OF BIRDS AND WASPS.—In my Surrey garden it is impossible in normal years to have any fruit—Peaches, Plums, and even Apples and Pears, unless it is protected from attack by birds and wasps. Shortage of labour prevented this precaution from being taken this year, and even the Peaches and Nectarines, of which there has been a wonderful crop, were left uncovered. Nevertheless the fruit crops have survived, so far as a Peach or Nectarine, and, so far as my observation goes, not a Plum, Apple or Pear, has been attacked either by bird or wasp. The birds seem to have deserted—not one of my nesting-boxes was occupied, and wasps are all but absent. Am I particularly lucky with my fruit, or is this immunity from attack fairly general? J.

SOCIETIES.

ROYAL HORTICULTURAL TRIALS AT WISLEY, 1918.

The Royal Horticultural Society will hold their 52nd Annual Show at Wisley, Surrey, from August 20 to September 25, 1918. The principal classes are:—(1) Perennial plants, including all kinds of flowers, and (2) Chrysanthemum maximum and its allies, to be held in 1918. Three plants of each variety to be tried together with the necessary entry forms, one for each variety, should reach the Director, R.H.S. Gardens, by November 30, 1917.

TRIAL OF LATE PEAS AT WISLEY.

The following awards have been made to Late Peas by the Council of the Royal Horticultural Society after trial at Wisley:—*Best of Year*, Latest of All, sent by Messrs. Barr and Sons, Longstender, sent by Messrs. Barr and Sons, and Messrs. Barr and Sons, Buntingford, sent by Messrs. Barr and Sons, Hildburgh, sent by Messrs. Barr and Sons, The Gladstone, sent by Messrs. Simpson and Messrs. Barr and Sons. *Commended*, Anticipation, sent by Messrs. J. Carter and Co., Late Queen, sent by Messrs. Nutting and Sons, Michelmas, sent by Messrs. Barr and Sons, No. 15 Ultra Selected, sent by Messrs. Barr and Sons.

Obituary.

J. C. COLLINS, Messrs. W. Guthrie and Son, of Hildburgh and Barmouth, writes an interesting and pithy account of the death of their traveller, Mr. J. C. Collins, who passed away on the 50th anniversary of the age of 66 years. He was greatly esteemed by all who knew him, and had worked conscientiously for the firm for the past thirty years.

E. D. TILL, The death has occurred of Mr. E. D. Till, of Exminster, Kent. Mr. Till, who was 75 years of age, was a keen naturalist, more especially enthusiastic on the subject of tree-planting. He worked for many years toward the establishment of Arbor Day in the country, and his own district contains many evidences of his energetic planting. He upheld the necessity for the establishment of trees, not only in towns, but also in villages and along country lanes. He was an occasional contributor in former days to the *Gardener's Chronicle*, and his letters on his favourite subject will be recalled with pleasure by our other readers.

CROPS AND STOCK ON THE HOME FARM.

WARDS FOR AGRICULTURAL WORKERS.

THE Corn Production Act, passed on August 21, which guarantees minimum prices of Wheat and Oats, also makes provision for fixing minimum rates of wages.

All farm workers, and also workers in market gardens, nursery grounds, orchards, woods and other beds, are included under the Act, which applies to boys, women and girls as well as men.

For the purpose of settling, under the Act, the lowest rates of wages which may be paid to workers in agriculture, a Central Agricultural Wages Board is about to be formed, consisting of sixteen members representing employers, sixteen members representing workers, and seven impartial persons appointed by the Board of Agriculture and Fisheries. The Wages Board will be established by the Board of Agriculture and Fisheries, after consultation with the Minister of Labour.

The Wages Board will have power to issue permits to enable workers who are infirm, or physically injured, to obtain employment at less than the minimum rates. Nothing in the Act prevents the payment of wages at rates higher than the minimum rates.

District Wages Committees will be set up throughout England and Wales, each comprising an equal number of representatives of employers and workers, respectively, and also one or more impartial persons appointed by the Board of Agriculture and Fisheries. These Committees will have to make recommendations to the Central Board as to the rates of wages applicable to their districts.

The representative members on the Central Board will be partly elected by organisations representing farmers and labourers, respectively, and partly nominated by the Board of Agriculture and Fisheries. The President will be glad to receive and consider suggested names or representatives of employers, submitted by farmers' organisations, or by groups of at least ten farmers, and of representatives of workers, submitted by labourers' organisations, or by groups of at least ten agricultural labourers. From among the persons so suggested nominated representative members of the Central Board and of the District Committees will be selected.

All suggestions of names, together with the full postal addresses of the persons suggested, should be forwarded at an early date to The Secretary, Board of Agriculture and Fisheries, 30, Pall Mall, S.W. 1. Members of the Central Board and of District Committees will be entitled to an allowance in respect of out-of-pocket expenses.

MAIZE FOR CATTLE.

THIS season is most favourable for the growth of Maize, and although milk cows have a quantity of grass available, a daily feed of Maize is a good change and it improves the milk, which, owing to the gross, soft growth of the grass, is not quite of the same quality as during drier weather. As there is likely to be a surplus of Maize this season it should be given to young stock on the pastures, thus saving the grass for autumn and winter food, as well as providing a change of food. Maize cannot withstand frost, a few degrees being sufficient to injure the succulent leaves. Breeding sows, too, appreciate this green food given in the yard.

THE CABBAGE CROP.

ESPECIALLY promising is the Cabbage crop intended for the cows and sheep during October and onwards. Some plots are infested badly with caterpillars from the Cabbage Butterfly, which will quickly do much harm to a valuable crop unless the plants are syringed with a strong solution of salt and water, which will cleanse the plants from the caterpillars. As the grass declines in the autumn in quantity and quality, Cabbage, given either on the grass or in the cowhouse, assists milk production, and, continued later with Mamollets, it is equally valuable. For sheep, too, Cabbage is a favourite food, especially for fattening lands, which thrive in some cases amazingly. E. Moloney.

THE APIARY.

By CHLORIS

WINTERING BEES.—It is necessary that each colony should have a sufficiency of sealed stores to carry the bees through the winter and early spring. To be quite safe the amount should be 30 lbs. As sugar is unobtainable for feeding it would be wise to sacrifice a stock in order to increase the food available for other colonies, and utilise the bees for strengthening any weak hives. Spacing combs that cannot be covered on both sides with bees should be removed, and the broad chamber reduced by the use of the division boards placed on each side the remaining frames. A strong hive is one that has 3 frames crowded with bees. The distance between frames should be reduced to a minimum, so that the distance from centre to centre of the frames should be 1½ inches, and this may be attained by using a wide and a narrow metal end alternately. Naturally the full combs of food will be on the outside of those containing brood. To prevent the bees from going under the frames to get their food, two pieces of wood about 2 inch square should be placed on top of the frames. When bees are compelled to use the lower part of the frames they are liable to be chilled during cold weather. It is surprising how many bee-keepers fail to realise how well every colony should be wrapped up. Over the frames place a piece of woollen carpet, or similar non-conducting material, that will exactly cover the whole of the frames, so as to leave no gaping holes, which only create a draught, which is harmful. Over this lay a good piece of folded brown paper, and on this another strip of carpet. Then provide yourself with a lightly packed cushion, fill it with chaff, cork dust, leaves, torn paper, shavings, or some similar non-conducting material, and the bees should be in no danger of suffering during any severe weather. In the case of "W. B. C." hives, and these are undoubtedly the best, the space between the brood chamber and the outside wall should be filled with chaff, as in the case of the cushion. See that the roofs are watertight. If there be any doubt, stretch tightly over the roof a piece of calico, tack firmly down, and give it several coats of paint. Sometimes the roofs are a considerable source of worry to those whose bees are some distance from home. They need cause no worry if a peg be driven into the ground on one side of the hive and a rope fixed to this long enough to nearly reach the ground on the other side, on the free end attaching a brick. The entrances should be closed so that one bee only can pass at a time, and where the strips of wood regulating the entrances are not like a "V" in shape, as under

the entrances should be shaded from direct rays of sunlight, for when snow has fallen and the sun shines brightly, bees are tempted to take a flight, which usually ends in death.

CLEARING WEEDS.—This is an excellent time of the year to make the ground around the hives free of weeds. It is essential that bees have unimpeded access in front, and it is decidedly good that the whole hive stand on a clear piece of ground, so that the air may circulate freely, and thus help to keep the hives quite dry, for damp hive walls are the cause of dysentery. To facilitate keeping the space free of weeds a good coating of coal ashes may be applied to the whole space freed, and this will make hoing very easy during the coming year. By this means the apiary will present a tidy appearance and render any work necessary in winter much easier and more comfortable, for weeds, including grass, retain much moisture from rains and dew, and soon make the strongest hoods wet through.

WEAK STOCKS.—Whenever the colonies are weak, or are headed by unproductive queens, do not hesitate to unite such stocks to others that would benefit by a little addition, utilising all the brood as far as possible and destroying use less or worn out queens.

ANSWERS TO CORRESPONDENTS.

CORRECTION.—Mr. Molyneux informs us that an error crept in in regard to the name of the prolific Potato illustrated last week; the correct name is Warwick Castle.

ELMS AS FOREST TREES.—If, *as I doan*, The Common Elm (*Ulmus campestris*) is the only species of *Ulmus* used on a large scale as a forest tree in this country, though *U. stricta* (ornamentalis), the Cornish Elm, and *U. Weymouthii* are also used to a certain extent. The two latter are more in demand as street-trees, the branches being more ascending than those of most Elms of quick growth, and therefore less liable to be broken by wind or snow. There are two trees known as the Dutch Elm: *U. Belgica*, a hybrid between *U. montana* and *U. nitens*, which is chiefly used on the Continent as a street-tree, and *U. major*, a hybrid of the same parentage, which is of the same, or somewhat less, value than *U. campestris* as a forest tree. Superficially there is a strong resemblance between the two, but the latter is a much larger and stronger grower.

NAVES OF FRUITS.—In the naming of fruits, we desire to oblige our correspondents as far as we can, but the task would become too costly and too time-consuming were there no restrictions. Correspondents should observe the rule that NO MORE THAN SIX VARIETIES be sent at any one time. The specimens must be good ones; if two of each variety are sent, identification will be easier. The fruits should be just approaching ripeness, and they should be properly numbered, and carefully packed in strong boxes, cartboxed, as often mentioned in the past. A leaf or shoot of each variety is helpful, and in the case of Plums, Peaches and Nectarines, absolutely essential. In all cases it is necessary to know the district from which the fruits are sent. By neglecting these particulars, correspondents add greatly to our labour and run the risk of increased delay and incorrect determination. We do not undertake to send answers through the post, or to return fruits, Fruits and bearing plants must not be sent in the same box. Being in any case is unworkable.

TIMBER MEASURING.—*T. H. B.* The timber measurer's equipment consists of a 66-foot Chestman's tape-line, or, instead of this, a 5-foot wooden rod, standard girth strap, scribe knife, and a bent piece of iron with eye at end for drawing the girth-strap beneath such trees as the arm cannot readily pass under. A piece of thin whipcord or string is frequently used for girthing timber, but as the elasticity of this varies greatly and has in many instances led to dispute, a much fairer plan,

and one that is liable to no abuse, is to use the 12-foot girth-strap, upon which every inch in length is reckoned one-quarter. The proper quarter-girth can, on this strap, be seen at a glance, and by adopting it the usual trickery to which the string and rule is liable is done away with. For entering the measurements the most convenient book is that 9 inches by 4 inches, with stiff pasteboard covers, ruled with horizontal lines, and divided into four vertical columns. To measure proceed as follows. Mark a number with the scribe on the butt end of the tree, and enter a similar number in the first column of the book, which will serve not only to identify the particular log, but prevent any risk of measuring twice. Should the taper throughout the whole length of the tree be tolerably gradual, set down the length in the second column of the book, opposite the number already entered. At exactly one-half of the length of the portion measured take the girth by passing the girth-strap tightly around the stem. Put this down in the third column of the same horizontal line as the number and length. Should, however, as frequently happens, the trunk taper not be fairly uniform throughout the entire length, several measurements may require to be taken. For example, a tree may be 36 feet in length, running of regular taper to perhaps 12 feet, after which it branches out, reducing the size of the remaining part very considerably for, say, another 12 feet, where it again branches and leaves the last 12 feet of a relatively small size. With such a tree it would be impossible to obtain anything like a correct measurement by taking only one length and girth. The difficulty is, however, readily got over by first measuring the lower 12 feet, then the second and third, giving the respective lengths and girths in the same vertical column as already described. The measurement of these trees, so far at least as the field work is concerned, is now completed, the contents being made up at leisure, by referring to "Hoppus's Measurer"—a book with which every forester should be supplied. By squaring the quarter-girth in inches, multiplying by the length in feet and dividing by 144, the same result will be obtained. This is, however, a tedious method, especially where a large number of trees have to be dealt with, and should only be adopted when Hoppus is not at hand. Measuring the height of trees: The most simple way is as follows: Take three laths, such as bricklayers use for tiling, and nail them in the shape of the frame: *a a* must be of equal length; *a* and *b* being placed on the ground, the eye must follow up the larger lath *d d* until it is in a line with *c*, the top of the tree or object you wish to measure. The frame must be placed as level with the bottom of the tree as possible. Should the ground be very uneven you must give and take accordingly. It will be seen that *b* to *c* is the same length as *c* to *e*. Kay's Dendrometer is also useful for obtaining heights of trees; it may be obtained from Dicksons and Co., Edinburgh. Average prices of home-grown timber: Apple and Pear, from 28, 6d. to 38, 6d. per cubic foot; Ash, from 35, 6d. to 48, per cubic foot; Alder, from 5d. to 10d. per cubic foot; Beech, from 10d. to 18, 4d. per cubic foot; Birch, from 5d. to 10d. per cubic foot; Chestnut (Spanish), from 18, 3d. to 18, 6d. per cubic foot; Chestnut (Horse), from 2d. per cubic foot; Cherry, from 9d. to 18, 2d. per cubic foot; Elm, from 7d. to 18, 3d. per cubic foot; Larch, from 9d. to 18, 6d. per cubic foot; Oak, from 18, 3d. to 28, 6d. per cubic foot; Poplar, from 9d. to 18, 4d. per cubic foot; Scotch Pine, from 4d. to 18, per cubic foot; Spruce Fir, from 7d. to 18, 4d. per cubic foot; Willow, from 18, to 18, per cubic foot; Walnut, from 18, to 38, 6d. per cubic foot; Sycamore, from 18, to 28, 6d. per cubic foot.

MARKETS.

COVEY GARDEN, October 5

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate from day to day, but occasionally several times in one day.—Eds.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots and their average wholesale prices. Columns include plant names (e.g., Aralia Sieboldii, Asparagus plumosus) and prices per dozen or per bushel.

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers and their average wholesale prices. Columns include flower names (e.g., Asters white, Carnations) and prices per dozen or per bunch.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage and their average wholesale prices. Columns include foliage names (e.g., Adiantum Maiden Hair) and prices per dozen or per bushel.

REMARKS. Cut flowers are only in moderate demand, and the trade is affected by the frost on the roads, and there is also some delay in the early morning arrivals. Prices generally are unchanged, and there are no new subjects on offer. Carnations are sufficient to the demand, and Roses are being offered in excellent condition. Chrysanthemums are getting more plentiful. Yellow varieties are the most scarce. Among the large blooms there are a few more in bunches of both white and coloured varieties. Several bunches of Violets (Princess of Wales) are arriving in better condition. Gladioli, Eucharis, and Stempetums are almost over for the season. There is abundant supply of Michaelmas Daisies of various sorts.

Vegetables: Average Wholesale Prices.

Table listing vegetables and their average wholesale prices. Columns include vegetable names (e.g., Artichokes, Beans) and prices per bushel or per dozen.

SITUATIONS WANTED (Continued from page iii)

GOOD SINGLE-HANDED GARDENER; Handyman, can be well recommended, married, over military age, good references, GARDENER, The Spring Lodge, Church Road, Hantsill, W. 7.

J. W. HARRIS, Beverden Gardens, Ox-shott, Surrey, highly recommended, a good, experienced, all-round GARDENER, with two or three men, age 40, two children, grown up, excellent character, 11 years in present situation.

SITUATION required as JOURNEYMAN (discharged) by discharged soldier, age 25, Eastern Counties preferred, E. CARTER, The Gardens, Holme Dale Hall, Theobald, North Hants.

LADY GARDENER seeks Situation, within 30 miles of London. Single. References on Nurses and Gardens and in Garden and Orchard. E. M. R. LARK, The Barnaby, Sparpeny Lane, Farningham, Kent.

WANTED, by TWO LADY GARDENERS, Post together, fifth or six class, previous experience, South of West Country preferred, state wages, Apply, MRS. HAY, Tempstone, Longborough, Leicestershire.

TRADE.

GENTLEMAN (50) desires WORKING MANAGEMENT, Farming, Gardens, small Estate, Food Production, improving, extending Fruit Plantations, Tomatoes, Mushrooms, Dairy Herd, Pigs, Accounts, Cart responsibility, B. Cox 6, 41, Wellington Street, Covent Garden, W.C. 2.

MANAGER, Market or Retail Nursery; life experience in all branches, 11 years' good previous experience, obstinate, married, age 45, not eligible, B. Cox 6, 41, Wellington Street, Covent Garden, W.C. 2.

MANAGER OF FOREMAN (WORKING) requires Post on good established Nursery, competent to take entire charge, good organizer of labour; orchids, Fruits, Fruit, Rose Trees, and general Nursery stock, energetic, Box 57, 41, Wellington Street, Covent Garden, W.C. 2.

MANAGER OF FOREMAN seeks Re-employment, end of October, life experience in Grapes, Tomatoes, Cucumbers, and Chrysanthemums, married, over military age, good references, F. 8, 74, East Street, Barking.

FOREMAN PROPAGATOR, Grower, and Salesman, life experience holding and setting out small all round Market Grower, well known in Covent Garden, JOHN SOLOMONS, Colgate, Essex.

SITUATION WANTED immediately, as CHARGE HAND, life experience with Cucumbers, Tomatoes, Chrysanthemums, and Carnations, also Vegetable, please state wages, protected through deafness, age 31, 10 years reference, White, 125, Albany Road, South Westham, Surrey.

FOREMAN, LADY desires re-engagement, experienced in all branches, highest references, Address, 11, LINDSEY, by, Albany Road, Leekship Lane, Wood Green, London N.

THE WEATHER.

THE WEATHER IN SCOTLAND.

At 10 p.m. on the 5th, in all districts, with a steady and south-easterly wind. The barometer had fallen to the level of the month was not so marked as it usually is in September. Remarkable on certain days, of which the following may be given as an example: On the 11th of the month, with a calm, and the wind only 1.42 m.p.h. by 10 a.m. on the 12th, by 10 a.m. on the 13th, the highest maximum temperature of 51° was recorded, and the lowest minimum 51°. On the 14th, the highest maximum temperature of 52° was recorded, and the lowest minimum 51°. On the 15th, the highest maximum temperature of 53° was recorded, and the lowest minimum 51°. On the 16th, the highest maximum temperature of 54° was recorded, and the lowest minimum 51°. On the 17th, the highest maximum temperature of 55° was recorded, and the lowest minimum 51°. On the 18th, the highest maximum temperature of 56° was recorded, and the lowest minimum 51°. On the 19th, the highest maximum temperature of 57° was recorded, and the lowest minimum 51°. On the 20th, the highest maximum temperature of 58° was recorded, and the lowest minimum 51°. On the 21st, the highest maximum temperature of 59° was recorded, and the lowest minimum 51°. On the 22nd, the highest maximum temperature of 60° was recorded, and the lowest minimum 51°. On the 23rd, the highest maximum temperature of 61° was recorded, and the lowest minimum 51°. On the 24th, the highest maximum temperature of 62° was recorded, and the lowest minimum 51°. On the 25th, the highest maximum temperature of 63° was recorded, and the lowest minimum 51°. On the 26th, the highest maximum temperature of 64° was recorded, and the lowest minimum 51°. On the 27th, the highest maximum temperature of 65° was recorded, and the lowest minimum 51°. On the 28th, the highest maximum temperature of 66° was recorded, and the lowest minimum 51°. On the 29th, the highest maximum temperature of 67° was recorded, and the lowest minimum 51°. On the 30th, the highest maximum temperature of 68° was recorded, and the lowest minimum 51°.

GARDENING APPOINTMENTS.

Mr. Charles Oakford, Gardener to the The Gardeners' Orphan Fund, 10, Bedford Chambers, Covent Garden, London, W.C. Mr. T. Barclay, for the past 24 years Gardener to Earl of H. S. Helms, and Lady of Holly Mount, Wellington, as Gardener to Colonel C. W. Whiston, R. G. Garden Park, Kirkby Lonsdale.

M. J. H. Saunders for 9 years Gardener to Mrs. CHRISTIAN, Matthe's Works, Place, Winchester, as Gardener to H. S. WATTS, Esq., at the same place.

struction and a better system of organisation, so that the allotment movement might be developed on sound lines. The Conference commenced on September 24 and closed on October 5; Mr. F. J. Chittenden presided over the Conference, and was assisted by Mr. A. S. Galt, Leeds University, and Mr. C. Wakely, Instructor in Horticulture to the Essex County Education Committee. Lectures were given and demonstrations held on eleven days, followed in every case by discussions which brought out the best methods of teaching, of practice, and of organisation. Some idea of the scope and value of the Conference may be gathered from the Syllabus of the subjects considered, the latter including: The Soil

about an hour and a half was added during the second week. The utmost enthusiasm prevailed throughout the Conference, and the desire was expressed that such a gathering should be held annually. The Rev. W. Wilks attended when the question of organisation was discussed, and it then transpired that three thousand letters had been sent to Allotment Associations with reference to the lectures and demonstrations on Food Production, and that the R. H. S. is working in close touch with the Food Production Department of the Board of Agriculture. Associations desirous of having lectures and demonstrations should apply to the secretary of the Royal Horticultural Society, who will notify the representative for the district; the Society

ON INCREASED FOOD PRODUCTION

THE ROYAL HORTICULTURAL SOCIETY'S VEGETABLE CAMPAIGN.

WHEN war broke out in August 1914, no one knew how long hostilities would continue, but many realised that a great European conflict would be bound to cause extraordinary demands by the fighting services upon capital and labour for a considerable period. Further, that some restriction of food imports would follow the commandeering of shipping for military transport, and that the withdrawal of labour from the land to supply the Army and Navy would inevitably reduce the amount of food-stuffs produced at home. The increase of allotment holdings throughout the country, and improved methods of cultivation, were obvious methods whereby additional food could be produced at home, in spare time, by those too old to fight, and by women; and the Council of the Royal Horticultural Society promptly advocated these methods. Within a few hours of the declaration of war the Council commenced a Vegetable Food Production Campaign, and it has been developed since in many ways, chiefly by the distribution of pamphlets, and by practical advice given by itinerant lecturers and advisers, and panels of gardeners who have voluntarily taken up this work in the various districts. In furtherance of this campaign the Council recently invited the lecturers and advisers to attend a Conference at the Society's Gardens, Wisley, for the purpose of securing uniformity of in-

struction and a better system of organisation, so that the allotment movement might be developed on sound lines. The Conference commenced on September 24 and closed on October 5; Mr. F. J. Chittenden presided over the Conference, and was assisted by Mr. A. S. Galt, Leeds University, and Mr. C. Wakely, Instructor in Horticulture to the Essex County Education Committee. Lectures were given and demonstrations held on eleven days, followed in every case by discussions which brought out the best methods of teaching, of practice, and of organisation. Some idea of the scope and value of the Conference may be gathered from the Syllabus of the subjects considered, the latter including: The Soil

will pay the lecturer's fees and the Association any out-of-pocket expenses incurred. In addition to Messrs. F. J. Chittenden, A. S. Galt, and C. Wakely, those present at the Conference included Mr. T. A. Lawson (Newcastle), Mr. J. Glavin (Bingley), Mr. G. Corbett (Bolton), Mr. A. C. Lehane (Mansfield), Mr. W. Stewart (Whitechurch), Mr. C. H. Starling (Norwich), Mr. W. H. Morter (Birmingham), Mr. W. H. Turner (Tenbury Wells), Mr. E. R. James (Reading), Mr. C. R. Fielder (Wimbleton), Mr. W. H. Divors (Surbinton), Mr. Chas. H. Curtis (Brentford), Mr. J. G. Weston (Ashford, Kent), Mr. A. E. Usher (Blandford), Mr. C. E. J. Walkley (Taunton), Mr. A. Andrews (Plymouth), and Mr. J. Lloyd (Denbigh).

SEASONABLE NOTES.

A SUPPLY of wholesome, well-flavoured Cabbage in spring is worth considerable trouble in procuring, and home-grown plants are usually preferred. The young plants may now be removed from the seed bed. At this season of the year a sharp frost may come at any time, and tender young plants crowded together are liable to suffer very severely. Plant them out, therefore, at once, so that they may be as strong as possible before frost is experienced. They should be planted 15 inches apart in their final quarters, the rows being 2 feet asunder. Plants with stems of a hard, woody texture will stand any amount of frost; in fact, the more exposed they are, the better they thrive.

Now is the time for ensuring the blanching of the heart and stems of Celery by enclosing the plants—i.e., drawing soil round them and banking it. The roots of the plants should receive a good soaking of water previously to earthing them; but it must not fall upon the stems, otherwise they will decay when the soil has been drawn round them. All suckers should be removed, and also any small, yellow, outer leaves, but no healthy green leaves ought to be taken off. The stems should be first drawn round the heart of the plant and tied with matting, or the plant must be held together with one hand while the earth is placed around it with the other. No particles of soil must be allowed to fall into the centres of the plants during the operation. Water should be given to the Celery copiously, and occasional doses of liquid manure will be followed by beneficial results. Liquid prepared from farmyard manure is best; failing this, soot dusted on the soil and watered in will stimulate the plants and be distasteful to worms and slugs.

Onions having been removed from the ground, should be put in a shed or empty room. When dry, the loose, rough outer skin and long, coarse roots may be removed, and the bulbs stored in any dry place to be kept for use; or they may be tied in bunches and strung on sticks, which may be suspended from holdfasts until the bulbs are needed. Decaying bulbs must be carefully excluded, otherwise they will contaminate the rest.

A supply of Radishes can be procured throughout the winter by sowing seeds of the varieties Black Spanish and China Rose. The latter is an excellently flavoured, oval-shaped root, which is largely grown for market during winter. Seeds of both varieties may be sown thinly at once on a warm, sheltered border, or, better still, in a frame. Thin the seedlings out as they attain size, finally leaving them 5 inches apart.

Spinach is a favourite vegetable with many persons, and if seeds have not yet been sown there is just time to repair the neglect. Choose the prickly-seeded, for it is the best. Sow thinly in drills 18 inches apart, and when the seedlings appear thin them out, leaving those remaining about 6 inches asunder in the rows. If allowed plenty of room they will become sturdy and hardy plants.

Carrots of all varieties that are fully grown should be lifted and stored without delay. If they are allowed to remain in the ground and much rain comes the roots will produce numerous fine rootlets, and when this happens the flavour is impaired; furthermore, if left in the ground many split and are rendered useless.

Beetroots should now be lifted from the soil with a fork, so that none of the rootlets is broken up, as this causes them to bleed and lose colour. For the same reason, the leaves should never be cut close to the crown. The roots must be dried for a day or two in the open before storing them in a cool shed or cellar; to preserve them properly and prevent shrivelling they should be stacked and covered with moderately moist leaf soil or sand.

Parsnips are much better left in their growing quarters until spring, a quantity being lifted

from time to time for use before severe frosty weather.

Potato stems have mostly died, and lifting of maincrop and late Potatoes is being proceeded with. If the object is to store the tubers outdoors in pits they should be allowed to dry first; choose a dry position and well line the ground with straw. The tubers should, as they are picked up, be separated, and those to be reserved for seed stored in a dry, airy shed. Carefully exclude all those that are diseased, and handle the sound ones with care. Pile the tubers on the straw in a ridge as high as convenient, cover with straw, and over the straw place 9 inches or a foot of soil and beat flat with a spade. Slope the surrounding soil away from the pit to enable all water to run away. The better and more convenient plan is to store the Potatoes in a shed, covering the tubers lightly with straw; this makes access easy for picking them over. Take note of the cropping capabilities, appearance, comparative immunity from disease, and, further, which are the best eating varieties. By strict note-taking the most serviceable varieties for any soil and purpose may be selected.

Give every attention to the winter greens. Make Brussels Sprouts firm in the ground by treading, or the autumn winds may dislodge them. Go over the plants and remove all decaying foliage and superfluous growths. Afterwards give the rows a dusting with superphosphate. This fertiliser is best applied in the autumn, for it is slow in acting. Basic slag, another good phosphatic manure, should also be applied in the autumn. Tie up the foliage of Endive to blanch the centres. Do this when the leaves are dry. Another method is to lift the plants and blanch them in a dark building, and it is particularly suitable for low-lying gardens.

Take advantage of fine, dry weather to transplant strong Lettuce plants into open, but partly sheltered, borders, where the soil is fairly dry and will remain so all the winter. These plants will prove of much value next spring.

Cauliflower plants should be examined daily that exposed heads may have the leaves broken and laid over them for protection against frost. Young plants for spring use should be planted in three or four inch soil in a sunny position, so that protection may be given by handlights. Attention must be directed to ventilation each day, the lights being removed during mild and sunny weather.

Leeks rank amongst the hardest of vegetables, and with a scarcity of others would be appreciated more than usual. In order to have extra fine, well-blanched stems, numbers of plants ought to have been put out in trenches, Celery fashion, or dibbled in rich ground, several weeks ago, but Leeks keep growing whenever the weather is mild, and if planted now on rich, freshly dug ground, may yet attain to a serviceable size. Make holes 8 inches deep and 12 inches apart with a stout dibber, drop a strong plant into each, and fix with water poured into the holes.

Turnips—There is a likelihood of these being in great demand during the winter. Plants ought now to be growing strongly, and there should be no undue delay in thinning out the later breadths, doing this lightly at first, and eventually leaving the plants about 8 inches apart. Where possible, water freely after thinning, that is, if the ground is dry; a surfacing of soot prior to the watering will do good.

Globe Artichokes—Remove all the lower leaves that are the least scathed, and dig the soil between the plants, ridging it in the rows to form little gullies between the lines of plants. Where the soil is of a retentive nature this ridging will prove beneficial. Later in the year leaves and other suitable material may be placed round the plants in northern counties as a protection from frosts.

Vegetable Marrows—Gather all large fruits, and place them in an airy house to ripen; they

can then be preserved if cut into small squares about the size of lump sugar.

Tomatoes.—Where the plants are heavily clothed with leaves some foliage must be entirely removed, and other partly cut away. However well favoured the plants may be in regard to position outside, few Tomatoes will swell from the green stage now and mature properly if left on the plants. The removal of the leaves has a beneficial effect, and fruits that are commencing to colour will finish well. Many cultivators gather the green fruits and ripen them on shelves; this course will answer, but I prefer to pull up the plants, strip off all leaves, and then suspend the stems from the wires in an airy glass structure or on the back wall. Many of the fruits so treated will ripen sufficiently, and are firmer.

All Asparagus ripe enough should be cut down and the "grass" burned. The surface of the bed must then receive a thorough cleaning, and the weeds removed to the heap for burning. It is not beneficial to put on a heavy dressing of manure immediately. A light mulch may be given later.

Parsley.—Plantations of Parsley should have all leaves which are not fresh and green removed. In many cases when this is done there will be a few large leaves left, but if there are plenty of young ones these will soon spring up and afford a useful winter supply. I prefer a thin row of fresh, young leaves to a bushy one of old foliage at the beginning of winter.

Finish the drying and storing of all herbs. J. A. P.

CARROT CHAMPION SCARLET HORN.

ONE of the best exhibits in the competitive vegetable classes at the R.H.S. Show on the 25th ult. was a dish of Champion Scarlet Horn Carrots, exhibited by Mr. H. E. Wallis, gardener to Eastace Palmer, Esq. The class was for a collection of nine kinds of vegetables, to be selected from a given list. The Carrots, which are illustrated in fig. 54, were perfect specimens, of regular shape, well coloured, and without a trace of bluish. Stump-rooted Carrots of this kind are exceedingly economical, as no waste occurs in preparing them for the table.

CABBAGE EXCELSIOR.

THE merits of this wonderful cabbage are all that one could desire. It should be sown under a south wall to be planted out early in the New Year to follow the Spring Cabbage. One foot apart each way is ample room, since it is a small variety, but it produces a firm head and excellent flavour. C. Davis, *Holy Wells Park Gardens, Ipswich*.

CELERIC.

NEVER do I remember this vegetable looking more satisfactory than it does at present. It is one of the most useful of winter crops, and if the roots are lifted and stored in sand, or finely sifted ashes, early next month, they can be used, as required, until next March.

The culture of Celeric is easy on land deeply cultivated and well enriched, but the plant needs plenty of water during dry weather. We have this year made an experiment of intercropping a long border devoted to Shallots, and I am more than pleased with the results. The latter have been harvested some time, and the border is now fully occupied with the Celeric.

In this particular case the variety is a new variegated form which much impressed me at the trials last year at Wisley. It was sent by Messrs. Barr and Sons. It has proved to be perfectly true, with a pleasing silver variegation and refined growth, and will, I feel sure, become a general favourite, and the plant is both ornamental and useful. Another very fine variety sent by the same firm, named Apple Shaped, is very promising. *Edwin Beckett*.

MESSRS. AUSTIN AND McASLAN.

In our last issue we gave particulars of the commemoration dinner which took place at Glasgow to celebrate the bicentenary anniversary of the establishment of Messrs. Austin and McAslan's business. We now give some particulars of the history of this firm, together with portraits of some of the more notable proprietors during the two centuries.

The business was founded in 1717 by John McAslan, who, in that year, rented ground from Hutcheson's Hospital as a nursery, situated behind the hospital buildings, at the foot of what is now known as Hutcheson Street. His brother Duncan was associated with him in the concern, and there is a record in 1727 showing that part of the lands of Deanside were let to Duncan McAslan. When John died is not known, but Duncan died in 1741. His widow succeeded him and carried on the business for some time. The first printed mention of the seed shop is in the form of an advertisement in the *Glasgow Journal* of January 17, 1760, when the business had passed into the hands of John McAslan, Duncan's son, and consequently a nephew of the founder.

In 1720 he gave up the ground at Deanside and also that on lease from Hutcheson's Hospital and removed his nursery to his own property, called The Hill. There he built a factory

in mission, which was the first house erected on that part of the site. This property was founded by Rottenburgh, Dollery's farm, property belonging to the Earl of Patrick, Bell, and what is known as Parliamentary Road. McAslan Street is on the site.

John McAslan was Trades Corporation, Trades Barle, Treasurer of the City, Foursinger for 30 years of the Buchanan Society, and afterwards President, Deacon of the Incorporation of Gardeners and Deacon Conventor of the Trades House, and he laid the foundation stone of the present building in 1791.

Robert Austin, who was born in the nursery, was made a partner in 1742, and the business was then styled McAslan and Austin. He was born at Craighton, Midlothian, in 1754, and served his apprenticeship in the gardens of Mr. Glassford of Douglasdale. He then went to London and was for a time in the nursery of Mr. Gammond at Chelsea, also at Hunt's Nursery at Putney, and with Mr. Chinnery at Ericson, returning to Glasgow in 1779 to enter the employment of Mr. McAslan, whose daughter Margaret he married in 1776. He sat in the Town Council for 25 years, part of that time with Mr. McAslan; he was Barle of the City, Treasurer of the City, Foursinger of the Trades House, President of Anderson's College, and was elected a corresponding member of the Horticultural Society of London in 1817. He was also a

JOHN McASLAN, 1717-1760. PROBABLY THE FIRST FORMER PROPRIETOR OF THE FIRM.

JOHN McASLAN, 1750-1815. WILLIAM McASLAN, 1756-1873.

JAMES McASLAN, 1812-1849.

ROBERT AUSTIN, 1752-1850. JAMES HUNTER, 1800-1904.

FIG. 56. SOME FORMER PROPRIETORS OF THE FIRM OF MESSRS. AUSTIN AND McASLAN.

Second Lieutenant in the Association of the inhabitants of the city of Glasgow—his commission bears the signature of King George III and the Duke of Portland; Captain in the 1st Glasgow Volunteer Infantry in 1805, commanded by Lieutenant Colonel Lawrence Craigie; and he became Lieutenant Colonel of the regiment in 1807.

The nursery was removed to Little Gosan in 1793, the ground there belonging to Mr. Rae, lying between Rutherglen Road and the Clyde, opposite the Fishers Haugh on the Green. Silver Fir Street, Lime Street and Orchard Street are on or near the site. The next move took place in 1828 to Coplawhill, on Pollokshaws Road, but when the Glasgow, Barrhead and K.I. mainock Railway passed through it another removal became necessary in 1863 to Titwood, on the Pollok Estate.

James Austin (grandfather of the present proprietor of the business) was brother of Robert, although 20 years his junior. He was born at Craigton in 1776, served his apprenticeship with John McAslan, subsequently went to London to gain further experience in the nurseries of Messrs. Ronald at Brentford, and also with Mr. Aiton in the Royal Gardens, Kew. He returned to the nursery as foreman about 1800.

In 1803 John McAslan retired from business, and his son Alexander was then made a partner by Robert Austin, and the designation of the firm was changed to Austin and McAslan. James Austin was admitted a partner in 1812. John McAslan died in 1815, Robert Austin in 1830, and Alexander McAslan in 1841. James Austin was then joined by his son Hugh, and Robert Thomson; the latter had been in the employment of the firm for a number of years. James and his son Hugh both died in 1849, and Mr. Thomson then assumed John Lowe as a partner. Mr. Lowe had been gardener to the Duke of Hamilton at Hamilton Palace. He died in 1854. Mr. Thomson then secured the services of William Austin, a nephew of Robert and James, as manager. He had been in business as a nurseryman at Partick, his firm being known as Brown and Austin. He was made partner in 1859, but the following year Mr. Thomson died. Mr. Austin was then joined by James Hunter, and under their joint management the business was much extended.

The seed shop, in 1760, was in Trogate (opposite the New Guard), at the corner of King Street; next, in 1769, it was in Hutcheson's Hospital Buildings, on a 15 years lease at £12 per annum. *Jones' Directory of 1788* gives the address as McAslan and Austin in Company, Shop 79, Trogate; from there it was removed to Number 114, John McAslan's own property (the present number of this shop is 168); then

to 186, premises now occupied by Mr. Robert Miller, stationer. In 1864 Mr. Hunter and Mr. Austin removed to 16, Buchanan Street, and, as already stated, the nursery was transferred to Titwood in 1863, where it remained till 1886, when another removal became necessary to its present site at Cathcart. The shop at 16, Buchanan Street, was burned down in 1868; new premises were, however, found at 89, Mitchell Street, the present headquarters.

William Austin died in 1873, and his son Hugh was admitted in 1877. Alexander Nielson Hunter, the present proprietor, was assumed in 1892. Hugh Austin died in 1894, and James Hunter in 1904.

ORCHID NOTES AND CLEANINGS.

CATTLEYA VENUS.

A FLOWER of a very remarkable variety of this cross between *C. Dowiana aurea* and *C. Iris* (*Dowiana aurea* × *bicolor*) is sent us by Mr. R. Windsor Richards. In this, and in most other *C. bicolor* crosses, that decided and distinct species asserts itself in the formation of the lip, with its front lobe on a narrowed extension from the base, the side lobes being small and closely approaching the fleshy column. In the variety now received the form is of *C. Dowiana aurea*, and *C. Iris* does not appear except in the thickened substance of the sepals, which also shows its bronzy-greenish colour, and the thick, white column. The sepals and petals have a pale bronze green ground, tinged and veined with rosy mauve. The openly expanded, crimped and fringed lip is purplish-mauve with a network of gold veining extending from the base to the centre.

CYPRIPEDIUM ETNA.

Mr. J. E. SMITH sends a flower of a very large and handsome hybrid between *C. Dreadnought* (insigne *Harfield Hall* × *Tidius* and *C. Lecanum Clinkaberryanum* (insigne × *Spicerianum*). *C. Dreadnought* was a fine development of the best forms of *C. insigne*, especially in size, but still retaining its colour and markings. The introduction of *C. Lecanum* in the present hybrid has further increased the size and shape and introduced showier colouring. The broad dorsal sepal is apple-green on the lower half and pure white above, and bears numerous spotted lines of rose-purple, the broader and darker lines being in the middle. The petals and lip are yellow tinged with mahogany red.

NEW HYBRID ORCHIDS.

(Continued from September 1, p. 85.)

Hybrid.	Parentage.	Exhibitor.
Brasso-Cattleya Catherine	B. C. Digbyana-Mossian × C. Mrs. Maria Peeters	Baron Schröder.
Brasso-Cattleya Delicia	C. Mendelii × B. C. Digbyana-Mossian	Duke of Marlborough.

Odontoglossum W. E. Bisset	crispum Mossian × Mats	Armstrong and Brown.
Sophronitis Eudoris	C. End × S. C. Doris	F. Smith, Esq.

The Week's Work.

THE KITCHEN GARDEN

By J. DEXX, Foreman, Royal Gardens, Windsor

MINT AND OTHER HERBS.—In order to have a supply of green Mint in winter a gentle hotbed should be made up as soon as possible, so that by the time the roots are ready for lifting a gentle bottom-heat may be available. The bed may consist of new leaves and manure from the stable in equal parts, and should be made tight by treading. A covering of sifted leaf-soil should be placed over the bed to the depth of 4 inches, so that the Mint roots may be lifted and placed closely together on the surface of the bed and covered with 1 inch of the sifted soil. Water should be applied at a temperature of 70° to settle the soil about the roots, and care must be taken to prevent the bed becoming overheated, or the roots may be scalded. When young growth appears the pit should be freely ventilated. Tarragon roots may be lifted and placed on the same bed as soon as the following has down. Marjoram plants which have been growing in the open border should be lifted and potted into 6-inch or 7-inch pots and placed in a slightly heated pit, which may be kept close until the roots are active. A temperature of 50° will suit this herb during winter, and the plants should be quite near the glass. Sweet Basil for winter use may be raised from seeds which should be sown at once in a temperature of 65°. Prick off the seedlings as soon as large enough and grow them quite near to the roof glass. Chervil should be sown at once in a cold pit to make certain of a supply in rough weather. After the seedlings are through the soil the lights may be removed until frosty weather sets in.

PARSLEY.—If this crop seems likely to become overgrown some of the plants may be cut down close to the ground, so that short, stocky growth may be produced; this will stand the winter much better than if left uncut during the autumn. Hoe the ground between the rows and sprinkle them freely with soot.

TOMATOS.—For a supply of Tomatos in early spring, sow seeds at once, germinate them in a temperature of 60°, and when large enough carefully pot the seedlings into small pots, placing them quite close to the roof-glass. Water carefully until the pots are well filled with roots, then shift the plants into 5-inch pots, making the fresh soil moderately firm. Admit sufficient air to keep the plants stocky and short-jointed. The temperature may range from 55° to 60°. Liberty and Dwarf Red are free setting varieties producing fruits of medium size. Tomato plants now swelling their fruits may receive a plentiful supply of weak manure water. Ventilate freely, and do not allow the foliage to become overcrowded. Plants now yielding supplies require a little fire-heat, so that the lights may be left slightly open at night. Gather the fruits as they become fit and place them in a cool, dry store room, where they will keep in good condition for some time.

THE HARDY FRUIT GARDEN

By W. A. COOK, Gardener to the Hon. ARTHUR J. BAYLY, Abbots Wood, Godalming, Surrey.

FRUIT-GATHERING.—In some cases the fruit trees will be visited more than once, as the fruit for storing will not be all ready at one time. Pears require careful handling if the bloom is required intact for the exhibition table. A little woodwool of the finest texture should be put at the bottom of the baskets or trays in which the fruits are to be placed, so that in transit from the tree to the fruit room they will not be shaken or bruised, and if Pears are grown for show purposes several trees of each variety selected for the purpose must be grown in order to obtain a selection. Louise Bonne of Jersey is still a popular and good variety, being wonderfully nice when in prime condition. Beurré Superfin, on most soils, produces fine-flavoured fruits; Comte de Lamy, though small,

is a fruit of great excellence. Marie Louise still takes some beating in its season—there are some people who still think that there is no Pear like it, as others think of Williams' Bon Chrétien, but, of course, in its season Doyenne du Comice is the best of all. Knight's Monarch, Ne Plus Meuris, and Olivier des Serres are finely flavoured, late varieties, and should be left some time yet before gathering. Many of the October varieties are useful for cooking or preserving.

ROOT-PRUNING.—The work of root-pruning may be started as soon as the crops are gathered, keeping the roots as near the surface as practicable, except trees on the Quince stock, which should be planted more deeply to allow the union between stock and scion to be just below the surface of the soil. In commencing root-pruning open out a trench 5 or 6 feet from the tree; for cordon trees a less distance will suffice. Carefully fork away the soil and examine the roots, and it may be necessary to lift the tree altogether in order to ascertain that no roots strike straight down into the soil from the centre of the root system. This done, cut away any long and useless or damaged roots and replace the soil. If the ground appears impoverished add a small quantity of new loam, mortar rubble, and bone-meal. Cover the roots and well ram the soil round with a wooden rammer, and if it is dry give a good watering. Add sufficient earth to allow for a slight sinking. Large trees are often much improved by this treatment—Apples, Pears, Plums, can all be so successfully root-pruned in this manner. In the case of old trees it is essential to apply plenty of new loam.

OLD FRUIT WALLS.—Some of the older fruit walls may require attention after the fruit is gathered, in order to make good the holes that afford harbours for insect pests. The best thing is to repoint them, but if this is impracticable in the present circumstances, give them a thick lime wash. The wash may consist of 1 peck of lime, ½ peck of soot, and 1 peck of slaked lime, mixed in petroleum and skim milk in equal proportions. This is an inexpensive but effectual wash when mixed well together to the consistency of mud and put on with a stiff brush.

FRUITS UNDER GLASS.

By JAS. HURSON, Head Gardener at Gurnersbury House, Aylesbury, W.

CHERRIES.—For repotting cherries use a little more finely broken up mortar rubble, with the soil mentioned last week, but make no other difference. If the Cherries are not quite so well rooted as one would desire, be very careful to preserve all the roots possible, or do not repot for one season. The early trees should be the first to receive attention. Those that have only just been relieved of their fruits can afford to wait for a few weeks until well ripened.

FIO HOUSES.—When the fruit is all gathered from planted out trees let the house be thoroughly well ventilated, and continue in this instance to use the syringe on fine days. If the wood has not been fairly well thinned out, it should be done at once. Do not leave any long, thin, attenuated shoots, but clear them right away, thus making more room for young growths. In the case of Figs, keep the borders rather on the dry side for some time yet; no risk will be run in doing this, it will rather assist in the ripening process.

POT STRAWBERRY FORCING.—Straw berry plants in pots should be examined as to the state of the drainage after the heavy rains, for it often happens that when standing upon ash beds the drainage becomes choked. Take off any runners, turn the plants round, and rearrange them, raking over the ashes at the same time. In the case of the earliest varieties it is a good plan to stand them upon the top of a low wall or upon boards, so that the plants may not receive quite so much water as formerly. If any of the later varieties were not potted up sufficiently early for the growth to be well advanced, place the plants in frames to finish off the growth. The lights can be left off on fine days, but put on at night, leaving them partly open. This will be a much better course than leaving them fully exposed during heavy rains,

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady Nourmont, Eastwell Park, Kent.

RICHARDIA AFRICANA.—If Richardias (Callas) are required for early winter flowering, some plants are usually kept in the pots all the season. Having been given a good rest by completely drying them off in the summer, they are potted up or top-dressed as found necessary, and watered to start them into growth. This is now developing rapidly, and the plants should be placed indoors. Give them plenty of ventilation for the present, and sufficient room so that the foliage will not get drawn. Those plants which were planted out-of-doors for the summer should be potted up without delay, as the foliage is very susceptible to injury by frost. Reduce the ball slightly and pot up in sizes according to the strength of the plant. Give a good watering, and stand the plants in a frame, or falling this, place them behind a wall for a few days. As soon as they have recovered from the shock, take them indoors and treat as recommended for those grown in pots.

CHRYSANTHEMUM.—Practically all plants, with the exception of the batch of bush plants in late blooming, will be best indoors after this date. In any case, all plants with well developed buds must be got inside, or the buds will be damaged by the heavy night dews or showers. The plants should be carefully examined, and if signs of mildew are found, a dressing with a reliable mildew specific should be given. I have found "Sedle" efficacious. Arrange the plants as thinly as is possible, with the space at command. Ventilate in favourable weather. Do not have high night temperatures; 55 is a safe temperature to aim at. If green or black fly is noticed, fumigate the plants as soon as housed, repeating this in a few days if any doubt exists as to their clearance. Water fairly early in the day, and as soon as the pots have drained, have the floors mopped as dry as possible. Keep the atmosphere from getting close and stagnant.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMY COLMAN, Bart., Gaxton Park, Beigate.

DISA.—The present is a suitable time for the repotting of Disas, commencing with *D. Lima* and other hybrids, while the species *D. grandiflora* may be given attention at a rather later period. Ordinary flower pots or deep pans from the most suitable receptacles, and for well-rooted plants they should be at least two sizes larger than those the plants now occupy, so that very little root disturbance will be necessary. Good drainage is essential. Let the rooting medium be composed of fibrous loam with the small particles removed, a little peat and Sphagnum moss cut rather short, and a fair sprinkling of crushed crocks and silver sand. The compost should be pressed moderately firm, and the receptacle filled to just below the rim of the pot. Place some living heads of Sphagnum moss over the surface of the compost; this will help to keep the roots in a moist condition, and at no time should Disas be allowed to suffer from drought, as they are perpetual growers, and have no defined season of rest. Place them in the coolest and shadiest part of the Odontoglossum house, and admit fresh air at all seasons. When repotting the house, remove the plants to another structure until the frames have escaped, or the leaves will become discoloured. After the repotting is finished, one watering should be given to settle the compost, and then for some time spraying once or twice each day, or often, according to the outside conditions, will be sufficient to keep them moist. The plants should be given occasional overhead sprayings with a liquid insecticide, or the leaves may be immersed in a similar solution to destroy thrips. The stock may be increased by breaking up any large specimens, taking care that each portion has a tuber attached; they may be potted up in rather small receptacles.

MILTONTIA ROEHLII AND OTHER SPECIES.—Both *M. Roezlii* and the variety *alba* are now making growth, and forming fresh roots. If repotting is necessary, be sure to arrange for ample drainage, and use a compost similar to

that recommended for *Miltontia vexillaria* in a former calendar; the plants should be given a light position near the roof glass in the intermediate house. Any plants of *M. vexillaria* which have been cultivated in the cool house during the summer should now be removed to the Cattleya or intermediate house. During dull, damp weather the immediate surroundings of the plants should not be kept too moist, or the foliage will decay. Brazilian *Miltontias*, such as *M. Regnellii*, *M. Bonatii*, *M. spectabilis*, and *M. Morelana*, having flowered, should only be given sufficient water at the roots to prevent shrivelling. *M. canattii*, *M. Lawsoni*, and *M. candida grandiflora*, as they pass the flowering period, should also receive similar treatment.

DECIDUOUS CALANTHES of the *Yeddoii* and *Vestita* types are now finishing their growth. The plants should be placed near the roof glass, and given plenty of space, so that the foliage may not shade the bulbs; a brisk temperature should be maintained in the house, with a good circulation of air. Plenty of water will be required at the roots until after the foliage begins to decay.

THE FLOWER GARDEN.

By W. J. GURSE, Gardener to Mrs. DEMESTRIE, Keele Hall, Staffordshire.

NATURALISING BULBS.—Recent rains have left the turf in good condition for planting bulbs. Where forced Daffodil bulbs were early harvested they should be planted at once. The bulbs will flower well in two years. If the soil below the turf is of poor quality it is advisable to replace it with a rich sandy compost. Woodland walks, grass banks, shrubberies, and positions under trees are all suitable places for bulbs. British grown bulbs are now available of most kinds, including Snowdrops, Winter Aconites, Scillas, Crocuses, Muscari, Anemones, Chionodoxas, Erythroniums, Narcessis, and late flowering Tulips. Most of these give the finest effects when planted in bold, irregular masses. If beds or borders are to be planted the ground must be prepared at once and a liberal dressing of decayed manure, leaf mould, or old potting-soil, well incorporated with the staple.

SEEDLING PERENNIALS.—Transplant seedling perennials in their permanent or reserve quarters. Plant moderately firm, and beyond watering through a fine rose to settle the soil nothing more is required.

VARIOUS BEDDING PLANTS.—Lift, and place in pots or boxes, *Lobelias*, *Alyssums*, *Alternantheras*, and similar plants required for stock purposes. Shallow frames are suitable for the *Lobelias* and *Alyssums*. Keep the frames close, shade from sunshine for a few days, and spray them overhead occasionally. Air must be admitted gradually, and just sufficient heat retained to exclude frost. Keep *Alternantheras* in a gentle heat and spray them lightly during bright weather.

PROPAGATING PITS AND FRAMES.—Pelargoniums that were rooted in boxes outside should now be removed to pits or frames, keeping them near the glass. Admit air on all favourable occasions. Cuttings rooted in frames should have the soil stirred lightly with a pointed stick. Pick off dead leaves and all flowers. The lights must now be placed in position. Cuttings in the propagating frame should be removed to cooler quarters directly they are rooted, for in a close atmosphere they grow weak and tender. Place the best of the old plants from the beds in pots or boxes for stock purposes next spring. The young shoots of *Verbenas* and *Freesias* are liable to attack by aphid, which can easily be kept in check by light fumigations or syringings with an insecticide.

CLIMBERS.—Wall plants and climbers growing in narrow borders get very dry at the roots, and occasionally a plant will collapse during a spell of dry weather, so examine the borders, and if any are dry, give sufficient water to reach all the roots. Complete the thinning and tying of the shoots, keeping them naturally disposed. Thin the shoots freely, only retaining those needed to fill bare spaces.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would oblige by abstaining from obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plans to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 39.8.

ACTUAL TEMPERATURE.—Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, October 11, 10 A.M. Bar. 29.5. Temp. 45.0. Weather.—Bright sun-bine.

SALES FOR THE ENSUING WEEK.

MONDAY—Bulls at 67 and 68. Cattle, at 1 o'clock, by Protheroe & Morris.
WEDNESDAY—Trade Sale of Bulls at Protheroe & Morris' rooms at 1 p.m.
FRIDAY—Bulls, at Protheroe & Morris' rooms at 1 o'clock.

It is to be hoped that steps will be taken to collect material for a comprehensive report on the results of spraying Potatoes during the past season. Such a report would be particularly valuable, for although the effect of spraying with Burgundy or Bordeaux mixture in preventing outbreaks of late blight is not to be gainsaid, there are many points on which further information is urgently required. One of these points relates to the conditions under which the spray fluid appears to produce damage to the foliage. Although, having regard to the large extent to which spraying was practised, the number of cases of damage does not appear to have been large, there appears to be little doubt but that in some instances the foliage of sprayed plants took on a sorry appearance after being treated with Burgundy mixture, and this result was not unimmutably attributed to the spray fluid.

In some cases there is evidence which points to the conclusion that if Potatoes have been subjected to severe attacks of aphid, spraying with copper sulphate results in damage to the leaves. The Potatoes grown in the beds outside Buckingham Palace are a case in point. Those who had an opportunity of watching the plants noted that the foliage was subjected

to a particularly severe attack by aphid. Nor is it surprising that leaves so attacked should be adversely affected by copper sulphate, for the innumerable punctures of the leaf mean so many wounds whereby the copper solution may gain access to the tissues of the leaf. The experiments carried out by Professor Barker and his colleagues at Long Ashton have shown that whereas intact foliage is impervious to the entrance of copper, foliage punctured by aphid does not oppose a like resistance to the entry of soluble poisons.

Hence it is quite possible that spraying foliage after aphid attacks may do more harm than good. It would be interesting to know whether in such cases a dry spray might not be used with better effect. It seems fairly clear that in general the wet spray is superior to the dry, although even here it must be admitted that further experiment is required.

Another point which appears to be worth further investigation is the apparently greater susceptibility to injury by spraying of Potato foliage growing in the neighbourhood of manufacturing towns. This possibility is again in accordance with what is known of the effects of town smoke and its contained impurities on leaf growth in general. Mr. Crowther's experiments have shown that the normal processes of leaves grown under those conditions are impaired, the vitality of the tissues is lowered, and in these circumstances it is not difficult to imagine that a fluid which may be spread with impunity on a vigorous leaf may do real damage when brought in contact with a leaf in a poor condition.

It is only natural, albeit entirely unscientific, for us to draw a general conclusion from a special case, and it is therefore to be hoped that the broad results of this year's spraying may be published. For our part, we have seen enough to be confirmed in our previous view that spraying is an indispensable method of insurance against loss of crops, and we hope that the practice will be followed yet more generally during the coming season than it has been during the past year.

A NOVEL BOUQUET.—On the occasion of Queen Mary's visit, on September 19, to a large vegetable-growing establishment in Coventry, a novel bouquet was presented to Her Majesty, composed entirely of vegetables. It contained red and yellow Tomatoes, young Carrots, Dwarf Beans, Potatoes, and Onions, while the necessary foliage was supplied by Parsley and Thyme.

REQUESTS TO GARDENERS.—The late Mr. George F. Insole, of The Court, Llandaff, Glamorganshire, left the sum of £100 to his former gardener, Mr. JOHN, and £50 to his present gardener, Mr. ARTHUR FRY.

EXPORT OF FRENCH NURSERY PRODUCTS TO THE UNITED KINGDOM.—The Board of Trade Journal for the 4th inst. states that the French Journal Officiel for September 13 contains a Ministerial Decree, dated September 17, which provides that by way of exception to the export prohibition imposed by the Decree of August 24, trees, shrubs, and all other nursery products may be exported or re-exported from France, without special authorisation,

when consigned to the United Kingdom, the British Dominions, Colonies and Protectorates, Belgium (uninvaded territory), Japan, Russia, or American countries.

WAR ITEMS.—We regret to record the death of ROBERT LEIGH KER, aged 19, who was killed in action on September 20 last. Deceased was the eldest son of Mr. ROBERT B. KER, Liverpool, and grandson of the late Mr. R. WILSON KER.

—News has reached us of the death of Private W. HEDGGS, who was formerly employed in the gardens at Shipton Court, Oxfordshire. He was wounded and taken prisoner on April 27, and died on June 27.

—We regret to learn that Lieutenant HENRY GEORGE MICHE, fourth son of Mr. ANDREW MICHE, nurseryman, Alnwick, died of wounds received in action in France, on September 26 last.

NEW OR NOTEWORTHY FRUITS.—In this bulletin Mr. U. P. HEDRICK continues his account of promising varieties of fruit. The Peach J. H. Hale, a chance seedling, probably from Alberta, continues to justify its high reputation with American growers. The fruit is perfectly spherical and of fine colour, a little harder in wood and had than its putative parent, and ripening a few days sooner. A newcomer is Pearson, a mid season, white-fleshed Peach of a quality similar to Champion, though perhaps not so well flavoured. It is, however, freer in the stone and ripens ten days earlier. A new red Raspberry which gives promise is Empire. The berries are larger than those of Cuthbert, but of similar colour. The texture is firm, and Mr. Hedrick thinks that it will prove a good "shipper"—a specially important thing in the Raspberry. Empire is the result of a cross between Ruby and Coutant. A new Strawberry, Good Luck, is among the best late berries in the station. Of firm flesh, it stands transportation well, and is very little susceptible to leaf-spot. The wedge-shaped fruits are large and handsome. It is, however, somewhat acid for a dessert fruit.

THE FLORA OF FORMOSA.—The Government of Formosa has issued the sixth volume of Dr. BRUNO HAYATA's *Icones Plantarum Formosamarum*, dated December 25, 1916, and the seventh (and last?) volume is promised for September, 1917. Previous volumes have been noticed in these columns, and Volume V, somewhat fully on July 29, 1916, p. 55. Volume VI, of the *Icones* contains descriptions of 126 new species, arranged after BENTHAM and HOOKER, and comprising new members of various families, from the Heberidiaceae to the Gramineae, and a few additional ferns, illustrated by twenty plates and sixty-one figures in the text. Ten genera are added to the flora, including a new one, named *Parasitipomoea*. The others are:—*Naphar*, *Picrasma*, *Gerbera*, *Gardneria*, *Acanthephippium*, *Vrydaggyia*, *Myrmecia*, *Gymnadenia*, and *Woodisia*. All of these genera, except, perhaps, *Acanthephippium*, are represented in China. *Parasitipomoea*, as the name suggests, is a parasite, and belongs to the Convolvulaceae. It is a leafless plant with liform stems, about 3 feet long and cymose flowers with funnel-shaped corollas, $1\frac{1}{2}$ inch long. Dr. HAYATA gives no particulars of the nature of the parasitism, nor of the hosts, of this interesting novelty, which has the habit of a *Cuscuta*, associated with flowers "nearly the same as those of *Ipomoea*." Among the new plants figured are: *Corylopsis stenopetala*, *Carpinus rankanensis*, *Vanilla Somai*, and *Archangiopsis Somai*. The *Carpinus* is remarkable in having slender, pendulous female catkins 4 to 5 inches long. There are few plants described in this volume of special horticultural interest, so far as one can judge from a cursory examination, though perhaps there may be something good among the fifteen new *Bambusae*. Accepting

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

STORING LATE FRUIT.—More or less frequently it is necessary to challenge opinion and set forth evidence in favour of new methods. The storing of fruit is very imperfectly understood. Few fruit rooms are of proper construction, and the influence of air, moisture and the emanations from fruit are not discerned so fully as to lead to good results. It is commonly stated that fruit Apples and Pears should be

Dr. HAYATA'S estimate, the total number of species of flowering plants and ferns now recorded as inhabiting Formosa is 5,346, belonging to 954 genera and 160 families.

THE PRICES OF SUPERPHOSPHATE.—The War Cabinet has fixed maximum prices for the sale of superphosphate in the United Kingdom on the basis of a delivered price of 26 5s. for 23 per cent. grade if delivered in December, with a reduction of 1s. per month before December and 1s. per month rise from January until May, 1918. Thirty per cent. superphosphate costs £5 10s. From 30 per cent downwards there is a reduction of 2s. 6d. per ton for each complete unit; from 30 per cent. upwards an extra of 4s. for each complete unit. The prices are for net prompt cash, in makers' or vendors' bags, delivered by rail or water to consumer's nearest railway station or wharf. An Order to this effect has been issued by the Ministry of Munitions, and a circular explaining the provisions of the Order can be obtained from the Food Production Department. The principal provisions of the Order are summarised as follows: (1) Superphosphate is to be sold by makers in lots of 2 tons and upwards delivered by rail or water at consumer's nearest railway station or wharf at the rates specified in the schedule given below; (2) farmers, mixers, agricultural merchants and dealers, and Co-operative Societies registered under the Friendly Societies Acts are to be allowed a discount on the scheduled prices of 2s. 6d. per ton on purchases of 2 tons and upwards; (3) where the consumer takes delivery from maker's works into his own carts or wagons for conveyance direct by road to his premises in lots of 2 tons and upwards, a deduction of 10s. per ton is to be made from the scheduled prices. It must be understood that makers are under no obligation to sell on these terms, as the ability to deliver into farmers' carts is obviously dependent on the orders in hand for delivery by rail, the stocks available for the fulfilment of orders of a future delivery, and the loading facilities at the works. Makers are not required to incur any expense or to provide labour for loading; (4) in the case of sales of lots of 2 tons and upwards for shipment to the Channel Islands, superphosphate is to be delivered f.o.b. at port of shipment at the scheduled prices; (5) where superphosphate is sold for delivery ex vendor's store or shop (but not ex maker's works), or ex warehouse, railway goods yard or public wharf, the following additional amounts may be charged: 4 tons and over, 5s. per ton additional to the prices shown in the schedule; 1 ton and over but less than 4 tons, 10s. per ton; 2 cwt. and over but less than 1 ton, 1s. per cwt.; less than 2 cwt., 2s. per cwt. These additional prices do not apply to sales of more than 1 ton for delivery ex railway goods yard or public wharf; (6) in the case of sales for delivery by road to consumer's premises from maker's works or vendor's store or shop, or from warehouse, railway goods yard or public wharf, cartage or haulage at local rates may be charged in addition to the prices specified in paragraph 5; (7) the prices referred to above are in all cases net prompt cash prices for superphosphate in maker's or vendor's bags. Where credit is given to the purchaser a reasonable extra charge may be made, provided that a price for net prompt cash is quoted on the invoice and does not exceed the maximum price authorised. If purchaser's bags are used, a reasonable allowance is to be made; (8) the above prices apply to superphosphate of fine manufacture from mineral phosphate, but do not apply to basic superphosphate, bone superphosphate, dissolved bones, bone meal, or bone compound, guano, or compound manure.

ROSA SETIPODA, HEMBLEY AND WILSON.—In flower and fruit, this new Chinese Rose is a distinct and pleasing addition to the wild Roses cultivated in pleasure grounds and shrubbery

leaders. The plant first flowered in this country in Messrs. JAMES VEITCH AND SON'S Combe Wood nursery in 1909, raised from seeds collected by Mr. E. H. Wilson in the Hupé district of Central China. At Kow a large bush is conspicuous in the Rose collection. In habit *Rosa setipoda* forms a large spreading bush 2 feet or more in height and as much in diameter. Unlike most Roses, it has a few spines, but these are a large size and borne in the main stems. Most of the leaves consist of 7 to 8 serrated leaflets. The purplish roseal and blossoms, about

FIG. 57.—FRUIT OF ROSA SETIPODA.

2 inches in diameter, are freely produced during June and followed in autumn by quantities of richly coloured, dark red, bottle-shaped fruits, each exceeding an inch in length, and copiously furnished with glandular bristles and large, persistent sepals. Fruiting sprays were shown by Mr. J. ATTENBORO at the Drill Hall on September 11. The elegant and graceful habit of this species forms a pleasing contrast or foil to the stately and handsome bushes of *R. Moyesi* both in flower and fruit

gathered when perfectly dry. As a fact, a wet or clean water surface is more an advantage than otherwise. Fruit should not be taken direct from the tree to the store room. To develop to the full flavour, colour, aroma and keeping quality in fruit, it requires to be sweated a process whereby carbon dioxide escapes through the skin and deposits an oily or grass-like coating which ensures a continuance of movement and perfect development of the fruit. The larger the body of fruit the better and more evenly it will sweat, but to avoid bruising

Photograph by W. J. Wallis

by pressure it is best to gather into boxes or baskets holding four or five layers, or, say, half a bushel of fruit. The boxes or other receptacles should be stacked close and compact in a dark or confined chamber below the reach of sun heat and air in motion. A barn, shed or disused stable, if free from strong odours, serves very well. Sacks or mats should be placed over the fruit in order to confine escaping gas, and thereby induce a mild rise in temperature and proper deposit on the skin of the fruit. The sweating process occupies from two to four weeks—the greener and harder the fruit, the longer it should remain in sweat boxes. Pears do not call for as much sweating as do Apples, and, taken as a whole, they require a drier chamber and drier air than do Apples, but sweating should always be resorted to excepting where fruit is taken from the tree perfectly ripe, in which case sweating would cause rapid decomposition and decay. It may here be said that fruit, to keep well, should be gathered whilst still firm and unripe. This applies more to Apples than to Pears, though some varieties prove exceptions to this rule. The fruit which comes to us from Australasia is taken from the trees fully two months before it may be regarded as ripe. It is not necessary for the pips to be brown for fruit when properly sweated and stored in a cool chamber holding plenty of moisture will go on developing from the time the pips are only slightly coloured. The ideal temperature for storing fruit is between 40° and 50° F. During transit in cool chambers a temperature of 41° is aimed at, but this is rather too low, and has a retarding effect on most fruit stored on land. Moreover, if a fruit room is very cool, fruit is incapable of change for the better, and it is owing to irregular temperatures that much late fruit is either woolly or tough, or too acid, or crude in flavour. The average fruit room is kept too dry, and that is why fruit shrivels and perishes. When fruit is properly sweated and placed in a chamber containing moist air it is virtually impossible for it to shrivel or fail to keep well. The way to control moisture in the fruit room is to place pans or buckets of water on the shelves or the most draughty parts of the floor. Such water should hold lumps of sulphur, and in the event of the air becoming very thick the pans or buckets of water may be removed. Water should not be thrown on the floor. There is no better way of judging the condition of the air of the fruit room than by noting the influence it exerts on the human body. When it seems a death-train—a chilling damp, catch-cold place, it is in ideal condition to preserve fruit well. Very hard and extra late fruits should be stored in the coolest and dampest positions. These will always be near the floor and in the least ventilated corners. Late fruit should never be stored with early or ripe fruit. The chamber should be made clean by whitewashing and by spreading fresh quicklime on the floor. Also a few ounces of sulphur should be burnt. Four ounces of sulphur reduced to fumes will serve for an area equal to a square of 20 by 20 feet. When the fruit is brought in it should be graded according to size, density and degrees of ripeness, and arranged accordingly. This saves a lot of labour and ensures a larger profit in every way. Fruit should not be laid the best side uppermost, or on its broadest base or side, but always with the most mature side downwards. The moisture and movement within the fruit is always upwards, and where the influence of this law is understood it will be noted that the ripening is evened and the fruit develops a mellow and attractive flavour in all its parts. For this reason it is sometimes necessary to turn fruit. Soft-skinned fruit keeps best on a bed of hay or rushes. Leaves and straw are liable to develop such worms as seize on any weakness in the skin of fruit. Sulphur should never be burned in a chamber containing fruit, as it virtually kills the skin and leads to shrivelling and loss of flavour, but slaked lime should be used to prevent mould on the floor or shelves. Air should be given only in the early morning and during the night. Ventilators should be in the roof or near it—and on all walls. If fruit does not mature fast enough, it should be placed on the highest shelves, the air reduced by closing vents, and more water brought

in. These are but a few hints for the proper construction of a fruit-room; the preparation and management of fruit is a business in itself, and not to be easily acquired or made plain. A. C.

THE WHITE MARTAGON LILY (LILIMUM MARTAGON ALBUM).—In 1913 we raised a large number of this beautiful variety of the common Martagon from seed saved from our own plants. About 30 per cent. came true, 15 per cent. reverted to the normal dull red, and 5 per cent. showed intermedial hues of pink. A few flowered in their second year; in the third year there was a fine display. I shall be happy to send seed of this year's crop to anyone who will forward a stamped, directed envelope. *Herbert Maxwell, Moncreith, Whauphill, Wigtonshire.*

AN EIGHTEENTH-CENTURY DURHAM CATALOGUE (see *Gard. Chron.*, pp. 155-6).—Largely through the kindness of Mr. H. M. Wood, of Durham, a well-known authority on local genealogy, I am able to answer, in part, my own query, "Who was James Clarke?" Among his volumes of Durham marriage licences Mr. Wood found one dated October 22, 1770, concerning James Clarke, of Houghton-le-Spring, aged 25, gardener, and Elizabeth Purdy, of Conhill, aged 25, the bondsman being Thomas Clarke, of Durham, gent. They were not married at Houghton-le-Spring, and Mr. Wood suggested my writing to the rector of Cornhill-on-Tweed. This I did, with the result that I have obtained a copy of the marriage certificate, from which it appears that James Clarke and Elizabeth Purdie (another form of Purdy) were married at St. Helen's Chapel, in the parish of Cornhill, Durham, on October 28, 1770, by the Rev. W. Whinfield, the witnesses being Samuel Purdie and James Foulton. Neither the Christian names, surnames, nor ranks of the respective parents is given in the certificate, nor the rank or profession of the contracting parties. The bondsman Thomas Clarke was probably the father of the bridegroom, and the witness, Samuel Purdie, the father of the bride. Since Mr. Wood could not find in the Houghton-le-Spring registers any baptism of a James Clarke, 1744-6, and assuming that Thomas Clarke was the father, the natural inference is that James Clarke was a native of Durham, and had settled in business on his own account at Houghton-le-Spring. His designation as "gardener" was in those days and long after applied generally to those who had to do with gardens, master or servant. It may be interesting to point out, though there may have been no connection whatever between the two Thomas Clarks, that the *European Magazine* records the death in February, 1792, at Jamaica, of a botanist of that name—a botanist, by whose name, who seems to have escaped the notice of Messrs. Britten and Boulton. Mr. Wood very kindly searched the Houghton-le-Spring registers and found the baptism records of four of James Clarke's children: the eldest, James, was baptised on December 26, 1771, and the youngest, Samuel, on April 27, 1773. As suggested in my article, James Clarke, the seedsman, may have been living after 1812, for there is no record of his death up to that year among the Houghton-le-Spring burials; or, on the other hand, he may have gone to another parish. At all events, I think these few supplementary facts are worth recording in print. Perhaps the most remarkable feature about this catalogue is that it was issued by a tradesman in a remote parish of England, and not from a big centre such as London, Edinburgh, or Dublin. If *Roberts, 18, King's Avenue, Clapham Park, S.W.*

GUNNERAS IN THE NORTH.—Of the larger Gunneras which have been tested in the colder parts of the country, the two calling for special remark are Gunnera scabra and G. manicata. The first is not absolutely reliable, although, if given a sheltered place, its success for at least a term of years may be anticipated. It appears, however, to be greatly harmed by strong winds. There are, however, places in the midlands of Scotland where it stands the winter quite well, and in Perthshire and on the west coast of Scotland it is apparently hardy, and attains large dimensions, its rugged, ornamental leaves being large and healthy. In other places, again, even where one might anticipate success, G. scabra may die in some severe winter, unless protected with

dry straw or other loose material. It also suffers from drought, and may be greatly weakened by a long spell of dry weather just before winter sets in. G. scabra major is a glorified form of the type, with larger and bolder foliage and taller stature. It originated, I believe, with Mr. T. Smith, Newry, and it does not appear to have found its way into many gardens. Although not so rugged-looking as G. scabra, G. manicata is the most majestic of the race in our gardens. It grows specially well in Ireland, where the humidity of the climate suits it perfectly. Some large plants receive as many as three loads of manure every year, and the leaves have in some cases reached the almost incredible size of 10 feet in diameter. I have measured leaves at Narrowwater Castle 9 feet across. So far as I can ascertain, this has not found its way so far north as G. scabra, but I believe that it is as hardy. In the south of Scotland there are some fine examples, probably the finest being that at St. Mary's Isle, Kirkcubright. In one garden not far from there, however, G. manicata refuses to grow well, although it has proved hardy there for more than a decade. Of the other Gunneras the only specimens I have seen tried in the north are the minims, G. magellanica and G. monica. The former seems to be the hardier of the two, but they have not been widely tried, as they appeal mainly to the esoteric cultivator of Alpine plants. G. magellanica has lived for the past twelve or thirteen years in a Kirkcubrightshire garden, but in another in the same county is only survived for a couple of years, dying in one of the severe winters, with which even this favoured shire is occasionally afflicted. *S. Truitt.*

CROPS AND STOCK ON THE HOME FARM.

WEEDS IN PASTURES.

WEEDS have flourished abnormally owing to the showery weather. Quite one of the worst of pasture weeds is the Yellow Ragwort (*Senecio Jacobaea*), occupying much space it allowed to establish itself. The bitterness of the flower-stems is liable to taint the milk of cows eating them. Merely the cutting of the flower-stems is not sufficient remedy, as the plants increase rapidly by root extension. With the flower-stems attached the roots are easily pulled up during wet weather. If this be done now the grass will quickly grow over the spot. Thistles, too, are numerous, but if these are repeatedly cut off they weaken and perish.

HEDGES AND THE HARVEST.

The showery weather experienced during the late harvest was a convincing proof, if any were needed, that high hedges around arable fields are a mistake, owing to the difficulty of drying the soil quickly after showers or heavy dews. In arranging the crops in the future, especially of Wheat, Oats and Barley, there should be no unnecessary high hedges around these fields. In the ordinary course of cropping with roots or other sheep food which usually follows some of these cereal crops hedges are not so harmful. In the case of pasture fields high hedges provide valuable shelter for the animals. But in the case of Wheat high hedges should on no account be permitted, as they harbour sparrows, which were so troublesome this season that in some fields they were responsible for a loss of 25 per cent. of the grain. This is a serious loss at a time when the crop is of a moderate character. *E. Molyneux.*

Obituary.

R. C. BROWN.—Mr. Richard Chapman Brown, of the firm of Messrs. W. and J. Brown, died at Peterborough on September 18. Deceased had been confined to his house for the past four months. He was only 43 years of age, and had resided in Peterborough for the past twenty years, where he controlled the firm's establishment in Narrow Street, and supervised the nurseries at Star Road, New Road, and Eastfield, Peterborough. He was a keen horticulturist, and took an especial interest in Rose growing. He leaves a widow but no children.

ROYAL HORTICULTURAL SOCIETY.

Exhibition of British-Grown Fruits.

OCTOBER 9. The exhibition of British-grown fruits in the Drill Hall of the London Scottish, Buckingham Gate, Westminster, on Tuesday last, was one of the most successful functions of the R.H.S. during the present year. The quality of the exhibits, both from out-of-doors and under glass, was exceedingly good, and we doubt if finer Apples and Pears have been shown at any previous exhibition. Choice dessert fruits from under glass were staged well by numerous exhibitors; Grapes were of choice quality, but the bunches were not so large as they are sometimes seen at exhibitions. The collections of hardy fruits staged by nurserymen were deserving of the highest praise, and competition in these classes was unusually keen. Messrs. SPOONER AND SONS' highly coloured fruits were the subject of general comment, whilst Mr. ALGERNON'S fine exhibit in the larger of the nurserymen's classes was of the highest perfection, and the same may be said of Messrs. G. BENVARD AND CO.'s and Messrs. J. CHEAT AND SON'S collections. We missed the pot fruit trees usually staged by Messrs. T. RIVERS AND SON and Messrs. BENVARD AND CO., it being a difficult matter to transport such bulky subjects by rail in these abnormal times.

The Fruit and Vegetable Committee met at 12.30 p.m. to consider novelties. An Award of Merit was recommended for a new late Plum of the Monarch type.

Fruit and Vegetable Committee

Present: Messrs. A. H. Pearson in the chair, A. R. Allan, G. P. Berry, J. Basham, F. P. Kins, J. G. Weston, H. Markham, A. Balfour, J. C. Allgrove, E. A. Bunyard, F. Jordan, T. Gumber, G. Reynolds, Owen Thomas, F. C. M. Veitch, W. H. Davis, J. Harrison, W. Bell, A. W. Metcalfe, Edwin Bockett, G. Woodard, E. Harris, Geo. Kell and W. Crump.

AWARD OF MERIT

Plum, Fatale Christian. The great merit of this new Plum is its late date of ripening. Fruits were shown on a previous occasion, and a sub-committee was appointed to inspect the tree on September 25 last in Mr. Vizard's fruit grounds. The report was favourable, the tree, growing as an isolated specimen, being found to be a vigorous grower and fruiting profusely. It is either a seedling or sucker sport, probably from Monarch, which it resembles, but is a fortnight later. The colour is deep purple, almost black, with a lighter bloom. The flavour is poor. Branches exhibited were crowded with fruits. Shown by Mr. Vizard, Churchdown, Gloucestershire.

Messrs. VEITCH AND SON, Exeter, showed sprays of the purple-leaved Peach bearing numbers of small, dull red fruits, also a form of Euxynous, European named fruit, common with fruits of a richer scarlet than the type.

Mrs. BARKLEY, Stretchley Park, Worcester, showed fine fruiting sprays of Vitis rotundifolia with bunches of small, dark blue Grapes.

Mr. CLOSE, Ovington, exhibited a fine Plum, The long, narrow, dark red fruits of good flavour.

COMPETITIVE CLASSES

DIVISION I

FRUITS GROWN UNDER GLASS

There were four entries in the class for 6 dishes of ripe dessert fruits, and the 1st Prize, consisting of a Silver Hoop Medal and 50s. was won by Lord SOMERS, Easton Castle, Ledbury (gr. Mr. G. Mullins), with fine bunches of Black Alicante and Muscat of Alexandria Grapes, a seedling Melon, Cox's Orange Pippin and Horn-blow Apples, Marguerite Marillat Pears, Humboldt Nectarines, and Barrington and Gladstone Peaches; 2nd, the Duke of NEWCASTLE, Chumber, Worsnop (gr. Mr. S. Barker), with good bunches of Muscat Hamburg and Muscat of Alexandria Grapes, and extra fine Thompson and Doyenne

du Concom Pears; and, F. A. CANN, Esq., J.P., The Node, Welwyn, Herts (gr. Mr. T. Pateman).

For a collection of 6 dishes of ripe dessert fruits Lord HILLINGDON, Wilderness, Sevenoaks (gr. Mr. J. Shelton), was awarded the 1st Prize. He showed Black Hamburg and Muscat of Alexandria Grapes, Lord Palmerston Peaches, Ribston Pippin and Cox's Orange Pippin Apples, and a fine dish of Marguerite Marillat Pears; 2nd, the Duke of WELLINGTON, Stratfieldsaye, Mortimer, Berks (gr. Mr. E. Matthews); and 3rd, F. R. ROBEY, Esq., Trobachilla Hall, Limerston (gr. Mr. F. A. Billings).

GRAPE.

There was a fairly good competition in these classes. For 6 varieties, 2 bunches of each, four competed. The Duke of NEWCASTLE led with 24 bunches of Gros Guillaume, and Chasselas Napoleon the latter wonderfully fine, and Muscat of Alexandria, Mrs. Pearson, Gros Feldman, and Canon Hall Muscat. The 2nd prize was won by G. MILLER, Esq., Northfleet, Radlett, Herts (gr. Mr. J. Kidd), who had fair sized, nicely finished bunches of Madresfield Court, Muscat of Alexandria, Alwark Seedling, Black Alicante, Appley Towns, and Lady Hill; 3rd, Lord HASTINGS, Melton Constable, Norfolk (gr. Mr. J. G. Besant), who had very large berried bunches of Gros Maré, Muscat of Alexandria, and Madresfield Court.

Lord HILLINGDON, Sevenoaks, was placed 1st for two bunches of Black Hamburg, followed in order by the Duke of NEWCASTLE and E. MATTHEWS, Esq. There were five entries in this class. For 2 bunches of Mrs. Pine, Lord HILLINGDON, Sevenoaks, and the Duke of NEWCASTLE won 1st and 2d Prizes respectively, with well coloured bunches. Lord HILLINGDON also excelled in the class for Black Alicante, in which Lord SOMERS was 2nd among eight competitors. Lord HASTINGS was the only exhibitor of Madresfield Court and was awarded the 2nd Prize. There was only one exhibit of Prince of Wales variety, and this, from G. MAYER, Esq., Welles Wood, Widdingham (gr. Mr. F. Norwood), was awarded the 2nd Prize. In the only other Black Grape class the Duke of NEWCASTLE scored with 4 bunches of Muscat Hamburg, Lord HASTINGS being placed 2nd with Alwark Seedling.

The best pair of bunches of Muscat of Alexandria, of eight exhibitors, came from the Duke of NEWCASTLE, 1st, and they were brightly coloured specimens; 2nd, S. D. EXAMER, Esq., Oaklark Lodge, Wexbridge (gr. Mr. G. Kelly). In the class for the other variety of White Grape Lord SOMERS led with Mrs. Pearson, followed by the Duke of NEWCASTLE with Canon Hall Muscat; there were six competitors.

COLLECTIONS OF HARDY FRUITS

For a collection of hardy fruits arranged on a space of 12 feet by 3 feet, two competed, and the 1st Prize was awarded to Mr. R. SAWARD, Pan-lange Gardens, Bedford. This excellent exhibit comprised fine dishes of Emperor Alexander, Rev. W. Wilks, Gascoyne's Scarlet Seedling, The Hamilton Connection, and other Apples; Pears La Foyette, Doyenne du Comice; Peaches Princess of Wales, Sea Eagle, and Late Doyen; Plums Late Orange, Cox's Golden Drop, Red Cherrins, Hatfield Berry, and Figs; 2nd, Lord SOMERS, with excellent Apples, Pears, Peaches, Cherries, Nectarines and Plums.

DIVISION II

NURSERYMEN'S CLASSES

Two classes were provided for collections, the larger being for an exhibit occupying a space of 30 feet by 6 feet, in which five competed. The 1st Prize was worthily won by Mr. J. C. ALLGERNON, Middle Green, Langley Slough. His fruits, including 4 Apples, Pears and Plums, were highly coloured, large, and excellent in every other respect. A conspicuous place was

given to thirty large fruits of Rev. W. Wilks' Apple. Fruits of Peasgood's Nonesuch were equally big and of splendid colour. Other excellent fine Apples were Charles Ross, Bismarck, Beenhelm Pippin, Emperor Alexander, Allington Pippin, James Grieve, Tower of Glanville, and Cox's Orange Pippin; whilst the finest Pears were Conference, Doyenne Boussoch, Marguerite Marillat, and Doyenne du Comice; 2nd, Messrs. G. BENVARD, Ltd., Maidstone, whose fruits were of high merit, especially such culinary Apples as Bismarck, Norfolk Beauty, Mere de Menage, Lord Derby, Royal Jubilee, Lane's Prince Albert, Warner's King, and Ecklinville Seedling; Pears Beurré Doyen (of exceptionally large size), Emile d'Hoest, Doyenne Boussoch, Belle des Arbrès, and Beurre Jean Van Ceel were all good; 3rd, Messrs. H. CANNELL and Co., Eynsham; 4th, Mr. R. C. NORRUTT, Woodbridge, Suffolk.

The smaller class, for a collection occupying a space of 20 feet by 6 feet, attracted five exhibitors, all of good quality. The 1st Prize was won by Messrs. S. SPOONER AND SONS, Hornslow, for large fruits of exceptionally high colour. Fruits of Beenhelm Pippin Apple were a decided, and the specimens were nearly as large as Peasgood's Nonesuch, of which a superb dish was staged. Others of extreme merit were Ribston Pippin (of marvellous colouring), Emperor Alexander, Gloria Mundi, Cox's Pomona, Bismarck, Withington, Fillsbasket, William Crump, and Mother; 2nd, Messrs. J. CHEAT AND SONS, Crawley, for fruits of refined quality, not so highly coloured as in the 1st Prize exhibit, but of sterling merit; St. Edmund's Russet, King of the Pippins (a glorious dish), Charles Ross, Crawley Beauty, Ribston Pippin, Royal Jubilee and Rival are a selection; 3rd, THE BARHAM NURSERY COMPANY, Barham, Sussex.

DIVISION III

MARKET GROWERS.

The single class in this section was for 20 baskets of Apples of distinct varieties, suitable for market. The only exhibitor was Lt Col. H. LEMLEY WHE, Ham Green, Upchurch, Sittingbourne, whose magnificent exhibit was awarded the 1st Prize. The very excellent fruits of Egremont Russet, Peasgood's Nonesuch, King of the Pippins, Warner's King, Gloria Mundi, Paroquet, Ben's Red, Allington Pippin and Lord Derby were deserving of high praise.

DIVISION IV

F. A. CANN, Esq., The Node, Welwyn, Hertfordshire, had the best exhibit of four in the class for 24 varieties of Apples, 16 culinary and 8 dessert sorts. The fruits were of very large size, the more notable being Tower of Glanville, Bramley's Seedling, Lord Derby, Tyler's Kernel, Chas. Ross, Wealthy, and Rival; 2nd, Lord SOMERS; 3rd, JOHN LINDOPE, Esq. (gr. Mr. R. Leermouth), Sherfield Manor, Basingstoke. For 12 varieties of Apples, distinct, 8 culinary and 4 dessert sorts, Mr. G. MILLER, Newberries, Radlett, Hertfordshire, was placed 1st, his best fruits being Rival, Gascoyne's Scarlet Seedling, Rev. W. Wilks, and Peasgood's Nonesuch; 2nd, Mr. F. G. GRANT, Mr. Cus excelled in the class for six culinary Apples, distinct, with magnificent fruits of The Queen, Emperor Alexander, Rev. W. Wilks, and others; 2nd, Mr. GRANT. The last named exhibitor led in the class for 6 varieties of dessert Apples, showing highly coloured fruits of Rival, Chas. Ross, James Grieve, Ribston Pippin, Cox's Orange Pippin, and King of the Pippins; 2nd, Lord SOMERS.

Mr. JOHN LINDOPE had the finest 16 varieties of dessert Pears, the best being Durodonan, Conference, Beurre Bachelier, and Marie Louise.

In the smaller class, for 9 varieties, Lord SOMERS excelled, followed by Lord HILLINGDON.

Four competed in the class for 3 dishes of dessert Plums, and the 1st Prize was awarded

to C. H. BERNERS, Esq., Woolverstone Park, Ipswich (gr. Mr. W. Messenger), the varieties being Cox's Golden Drop, Reine Claude de Ravay, and President; Mr. LIPBELL, who won the 2nd Prize, had remarkably good fruits of Evans' Late Orange. Mr. GERRISH showed the best Blunsom, Lord Somers the best Morello Cherries, and E. PALMER, Esq., Drayton House, Sheffield-on-Loddon, the best Raspberries.

(To be concluded.)

SCOTTISH HORTICULTURAL.

OCTOBER 2.—The monthly meeting of this Association was held at 5, St. Andrew Square, Edinburgh, on this date, Mr. J. Highgate, vice-president, in the chair.

The Chairman made sympathetic reference to the sudden death of the President, Mr. John Phillips. A letter of condolence had been sent to Mrs. Phillips.

A paper on "Michaelmas Daisies" was read by Mr. ALEX. FORSTER, Davidson's Manse.

The exhibits were: Collection of Michaelmas Daisies from Mr. PORTER (Silver Medal) collection of "Collected" Dahlias, Chrysanthemum Harry Thorpe, and Potatoes, from Messrs. DOBBIE AND CO., Edinburgh (Cultural Certificate); Stevia paniculata, from Mr. M. TOWN, Musselburgh; Montrosea Star of the East, from Mr. W. G. PIRIE, Dalhousie (Cultural Certificate); new single Chrysanthemum Mrs. A. James, from Mr. A. INNES, Dean Cemetery, Edinburgh; tuber of Potato Duke of York, weighing 2 lbs., from Mr. F. Low, Cullen House, Banffshire.

NATIONAL SWEET PEA

OCTOBER 9.—The Annual General Meeting of the National Sweet Pea Society was held on Tuesday last at the offices of the British Wholesale Florists' Federation, 35, Wellington Street, Covent Garden. Mr. E. W. King, the president, presided.

The report and financial statement were presented. Both the Society's trials of novelties and the exhibition were abandoned in 1917. The *Sweet Pea Annual* was published, and a small exhibition was held at Westminster in conjunction with the Royal Horticultural Society's meeting on July 3. The financial statement showed a balance in hand of £3 14s. 5d.

The standing orders were suspended to permit the re-election en bloc of the president, officers, and committee. Mr. C. H. Curtis was appointed to fill a vacancy on the committee caused by the resignation of Mr. Gee. It was decided not to conduct a trial of novelties in 1918, but it is hoped to hold a small exhibition at one of the R.H.S. meetings in July next.

NATIONAL CHRYSANTHEMUM.

OCTOBER 8.—Not a solitary flower came before the members of the N.C.S. Floral Committee on Monday, October 8, at Essex Hall. The business conducted consisted in adopting the minutes of the previous meeting and passing a vote of condolence to the relatives of the late Mr. Eric Such, formerly a member of the Committee.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

OCTOBER 8.—Two special general meetings have been held on previous dates for the purpose of adopting the necessary additional and amended rules relative to juvenile members, but on neither date could a quorum be obtained. At a third meeting held on Monday last, sufficient members attended at the R.H.S. Hall, and the juvenile section was formally constituted.

ENQUIRIES

ADDRESSES REQUIRED.—"Can anyone give me the name and address of a firm in England or abroad which manufactures weed?" 2. Where can Dip-sus Inlamm (Piller's Teazel) be obtained? J. B. Hurry, M.D., Westfield, Reading.

TOMATO CHRYSON KING.—Where can I obtain seeds of Chryson King Tomato? Juy Ess.

ANSWERS TO CORRESPONDENTS.

ASPARAGUS; S. A. As soon as the foliage has died down it should be removed, and the surface of the bed carefully pricked over. If the soil is sour a considerable portion should be drawn off the bed and a dressing of sharp, sandy soil placed over the crowns to a depth of 2 inches. After this, add 2 inches of decayed horse manure to the bed and allow it to remain throughout the winter. At the end of February lightly break up the manure and place over it a covering of fine soil. A dressing of agricultural salt may be applied in March, and again a month later. In the meantime, trench and prepare a piece of ground, so that a new bed may be made up in spring. If two-year-old crowns are planted so much the better.

CELERY DISEASED; E. H. M. From your description the disease attacking the Celery would appear to be the Celery rust fungus. The first symptoms of this disease are swollen, pale spots on the leaves; soon afterwards the cuticle over these spots breaks, and liberates the brown, powdery spores, which spread over the leaves like snuff. You should pull up and burn all plants which display any of these symptoms, as the disease is very contagious, and spray the healthy plants occasionally with diluted Bordeaux mixture if the condition of the plants are not past remedy.

CERIC CONTENTS OF TIMBER; J. E. PROCTOR Webster's *Forestry Diary*, price 2s. 6d. net.

FOOD CROPS FOR GREENHOUSES; JAC. FISH. See reply to H. W., printed in the issue for September 22, 1917.

FORMAL GARDEN; C. M. L. The spaces between the flagstones were undoubtedly left for the accommodation of suitable plants of dwarf growth, and it should not be difficult to keep them clear of weeds. We do not think you could satisfactorily decrease the spaces except by taking up and re-laying the whole of the flags. You might try the use of cement, but I would probably crack, as you suggest.

FRENCH FUS LAWN; J. B. The growth is that of a foliose Lichen. Its presence on the lawn shows that the site is damp and ill-drained. If you remedy this by good draining, the Lichen will disappear.

LIME-WASHING FRUIT WALLS; F. J. F. Follow the directions given on p. 146 in the calendar on the "Hardy Fruit Garden."

MUSCAT GRAPES; B. B. The reason why vapourising with mercuric compounds is injurious to Muscat Grapes is that they have particularly thin, delicate skins. In order to get rid of aphides in the house you can try painting a mixture of flowers of sulphur and water on to the pipes when they are hot, closing all ventilators during the operation.

NAMES OF FRUITS. In the naming of fruits, we desire to oblige our correspondents as far as we can, but the task would become too costly and too time-consuming were there no restrictions. Correspondents should observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones; if two of each variety are sent, identification will be easier. The fruits should be just approaching ripeness, and they should be properly numbered, and carefully packed in strong boxes; cardboard is often smashed in the post. A leaf or shoot of each variety is helpful, and in the case of Plums, Prunes and Nectarines, absolutely essential. In all cases it is necessary to know the district from which the fruits are sent. By neglecting these precautions, correspondents add greatly to our labour and run the risk of increased delay and increased dissatisfaction. We do not undertake to send answers through the post, or to return fruits. Fruits and flowering plants must not be sent in the same box. Delay in any case is unavoidable.

H. C. P. Franklin's Golden Pippin;—H. B. S. Broad-eyed Pippin and Bramley's Seedling, both good keeping Apples. H. W. Pears; 1, Primston Duchess; 2, Emile d'Heyst; 3, Bourne d'Anandis; 4, Fondante d'Autumn; 5, Glou Morveau Apples; 1, Red Asterham; 2, Scarlet Nonpareil; 3, Stirling Castle; 4, P. M. A. Hornwood's Pearmain; B. not recognised; C, White Nonpareil; D, Golden Harvey; E, King of the Pippins; F, Ribston Pippin; G, Green

Fullwood; H, Lane's Prince Albert; J, Prince Bismarck; K, Lord Burghley; L, not recognised.—D. W. 1, Lord Burghley; 2, Potts's Seedling; 3, Cox's Pomona; 4, Stirling Castle; 6, Pear Doyenne Boussoch.—O. R., *Meopham*. 1, Cox's Orange Pippin; 2, Lord Suffolk; 3, The Queen; 4, Peasgood's Non-such; 5, New Hawthornden; 6, Warner's King; 7, deformed fruit; not recognisable; 8, Cox's Pomona. Pears; 1, Nouveau Poiteau; 2, Doyenne du Comice.—F. S. H. Pears; 1, Decayed; 2, Beurré Hardy; 3, Apples; 5, Tyler's Kernel; 4, Cackle Pippin; 5, not recognised, probably too small to be representative. H., *Sudbury*. Pears; 3, Catillac; 4, Beurré Rance—the rest too undeveloped to recognise. Apple; Norfolk Roofing.—G. A. Your Pears are not nearly ripe, and they were gathered before they had finished growing. They cannot be identified.—J. E. S. 1, Gascoyne's Scarlet; 2, Potts's Seedling; 3, Allington Pippin; 4, Prince Bismarck; 5, Cornish Mother; 6, Peasgood's Non-such.—J. K. 1, Yellow Ingestre; 2, Thompson's; 3, Fearn's Pippin; 4, Bacon's Incomparable; 5, Brockworth Park; 6, Cox's Orange Pippin; 7, Sickle.—C. H. W., *Reading*. King of the Pippins.—C. W. P. Mirabelle.—*Susse*. 1, Louise Bonne of Jersey; 2, Marie Louise d'Uccle; 3, Vicar of Winkfield; 4, Winter Queening; 5, Striped Beefing; 6, Beurré d'Anjou.—*Pomona*. 1, Hornwood Pearmain; 2, Nanny; 3, Alfriston; 4, Cheshunt Pippin; 5, Stirling Castle; 6, not recognised.—1, K. Apple Jolly Beggar; Pear Colmar d'Été.

NAMES OF PLANTS.—Correspondents not answered in this issue are requested to be so good as to consult the following number.

H. C. B. Carolean Cherry (Cornus mas);—E. G. H. 1, Crataegus punctata var.; 2, Pyrus betulaefolia;—J. H. Frame, Red Oak (Quercus rubra);—M. W. 1, Crataegus crus-galli (Cockspur Thorn); 2, Spiraea Douglasii.

PELAGONUM CUTTINGS; E. B. You need not apply water to the cuttings until they appear ready to flag. They should be removed indoors almost at once, as frost may occur. They can be potted singly at any time during the winter, when outside work is difficult; no harm will result if the potting be left until February.

PLUM TREES; C. H. W. That the fruits fall from the trees when about the size of Peas is probably due to a deficiency of lime in the soil, which interferes with the proper stoning of the fruits. Basic slag, applied to the soil at the roots of the trees in the proportion of three or four ounces to each tree, would probably be beneficial; it should be applied at once, as it acts slowly.

POTAMOGETON, OR ZANNICHELLIA; Pond-weed. The weed is Potamogeton perfoliatus. It bears a considerable resemblance to Zannichellia, but the stipules are free and fall away after a time, so that in autumn you can find them only on the terminal buds enclosing the young leaves. In Zannichellia the stipules are attached to the edges of the leaves, and may be found at all times until they decay. When labour can be found, this weed can be kept down or largely destroyed by dragging the pond with some form of rake. The most effective way of clearing the pond is to dry it, preferably in spring or summer, and shovel out the mud in which the weed finds a suitable root-hold. The mud, when laid in a heap, limed and allowed to sweeten for a year, turning it once or twice during that period, makes an excellent top-dressing for grass.

WORM-CASTS ON LAWN; O. D. M. Dissolve half an ounce of corrosive sublimate in 15 gallons of water, and sprinkle it over the lawn. When the worms come to the surface sweep them up, and do not let fowls eat them, as the sublimate is poisonous.

Communications Received.—R. D. (Thanks for 2s. 6d. for R.G.O.F. box);—J. H. R., D., Dublin.—F. H.—F. S. W., E. A., D., Mex.;—J. E. S. S., E. W.;—F. H. for naming overripe, send two fresh specimens;—A. Nix; J. W.—W. R. A.—G. W.—J. B. R.—W. T. J.—M. W.—P. R., Pries;—Sir W. C. G.—Dr. H. E. D.—F. H., Birmingham;—W. C.—H. W. T.—P. M.—F. G., Ralston;—J. Aspey—W. S.—L.—Alwood Bros.—Geo. L.

THE DIFFERENCE between a good advertisement and a bad one is a frequent subject for discussion among those who are determined to get the best use out of the money they spend on publicity. In the end, it resolves itself into the difference between wealthy readers and poor ones. Those who are advertising cheap goods naturally turn to a journal with an enormous circulation, even though it may be composed of people of indifferent means. But those who supply the highest and only necessities of a large garden, for as that such a garden presupposes a number of means as the owner, who can afford to employ the garden itself, but a staff of permanent gardeners to tend it. To such a salesman, a journal that reaches the hands of thousands, or even millions, of poor people, is of no use. He should turn rather to a journal, such as the "Gardeners' Chronicle," which reaches the right people, the keen professional gardeners, and the few but rich amateurs. The response of such readers to a well-placed advertisement is immediate and substantial.

BARR'S May-flowering TULIPS, the finest in the world, from spring, plain now. 10/- per dozen. **BARR & SONS, King Street, Covent Garden, W.C. 2.**

PROPERTY TO LET.

THE BARLEY ESTATE, EXETER.

To Nurseyman, Market Gardeners, and Others whom it may concern.

TO be LET, from Christmas, 1917, all these well-known GARDENS, known as "The Bechall Nurseries," for many years past, in the occupation of the late Mr. Geo. Kerswill, situate in the parish of St. Thomas the Apostle, and within one mile of the centre of the City of Exeter, comprising:—

House, Buildings, and Yards	£ 1 10 0
Gardens	13 0 14
Pasture Land	5 1 8

The Buildings consist of an historically interesting and commodious Dwelling-house, with ample accommodation for storing and packing fruit, &c., Carpenter's Shop, Stable, Van-house, Cowshed, Piggeries, Cart, and other sheds.

The Gardens are fully stocked with the choicest sorts of standard Apple, Pear, Plum, and Cherry Trees, Gooseberry and Currant Bushes, and Raspberry Canes. There are also Peach, Plum, and Cherry Trees on about 400 yards of wall.

The whole Stock consists of about 7,000 Trees and 24,000 Bushes. The greater part of it was planted by Mr. Kerswill, who was an excellent judge of the most profitable and marketable sort of fruit to grow. The whole is now the property of the Landlord, and will be included in the letting.

Further particulars, with permission to view, may be obtained, and the form of tenancy Agreement inspected, at the offices of MESSRS. J. & H. DREW, 15, Queen Street, Exeter, Land Agents and Surveyors.

PUBLISHERS' NOTICE.

A NEW EDITION OF THE PERPETUAL FLOWERING CARNATION.

By MONTAGU C. ALLWOOD, F.R.H.S.

A practical book by a practical man, containing all necessary information for the good cultivation of Carnations. Price 1/2 from

LIVERPOOL CORPORATION.

NURSERY STOCK.

FARM AREA, near GATEACRE.

OVAL-LEAVED PRIVET.

Special offer of the following lots, all in grand condition: Two years, strong and well rooted, all—

10s. per 1,000	10s. per 1,000
90s. per 10,000	800s. per 100,000.
Very bushy transplanted out backs, 18-24 inches	20s. per 1,000.
Very bushy, transplanted, cut backs, 30s.	250s. per 10,000.
Very bushy, transplanted, cut backs, 24-35 feet	40s. per 1,000.
Very strong and bushy, 3-4 feet	350s. per 10,000.
Very strong and bushy, 4-5 feet	10s. per 1,000.
Very strong and bushy, 4-5 feet	80s. per 1,000.

ALSO THE FOLLOWING, ALL FINE:

Aucuba japonica, bushy plants, 15-18 inches, 2s. 6d per doz.; 25s. per 100.	
Doitto, 24 inches	3s. per doz.; 30s. per 100.
Sycamores, fine well-furnished trees, 12-16 feet, 2s. and 3s. each; 20s. and 30s. per doz.	
Laurel rotundifolia, 4-4½ ft., 9s. per doz.; 60s. per 100.	
Thorns, Crimson and Pink, 6-7 feet, 1s. each; 9s. per doz.	
Fruit Trees, in a number of leading varieties, 5 and 6 years old, 10s. per doz.; 70s. per 100.	
Pear Trees, Cherry Trees, large fruiting size, 2s. and 3s. each.	
Prunus Pissardi Bushes, 3-4 feet	7s. 6d. per doz.

These prices are free on rail at Gateacre or Garston Station.

Apply to THE CITY ENGINEER, Municipal Buildings, Dale Street, Liverpool; or his Representative, MR. J. HAIGH, Public Offices, Grange Lane, Galsacre.

MISCELLANEOUS.

THEY'RE NOT STICKY.

Beacon Oilskins are quite free from any stickiness, and what is more important, they never fail to keep out the hardest rain or sleet. Hundreds of farmers, gamekeepers, and other outdoor men, women, and children wear them because they bring weather comfort. You ought to wear them if you want to keep dry in any deluge. The Beacon Booklet will help you to choose the style you need. Children's Coats from 10s. 6d., Men's from 10s., Ladies' Smart Oilskins, 28s. Long Leggings from 5s. Sou'-westers from 1s. 9d. Your money back if they don't satisfy you entirely. Send a postcard today for our Free Booklet of "Weather Control."—Send now, before you forget—to **BEACON OILSKINS, LTD., 60, BEACON BUILDINGS, SOUTH SHIELDS.** (2)

LANG'S "IDEAL" MANURE, for Fruit, Flowers, and Vegetables: 12s. 6d. per cwt., 210 lbs. per ton, carriage paid.—G. LANG & SONS, LTD., Hounslow, Middlesex.

"PESTITE" destroys all soil pests (caterpillars, grub, wireworm, wart, disease, &c.) and promotes vigorous growth. Price 10s. 6d. per cwt., £5 per ton, carriage paid.—G. LANG & SONS, LTD., Hounslow, Middlesex.

SITUATIONS VACANT.

Four Lines 3s. (Head-line counted as Two), 6d. for each succeeding line.

PRIVATE.

WORKING HEAD GARDENER required at once, three milder, exact wages and cottage.—CROPPER, Portcuthrie, Monmouthshire.

WANTED, UPPER GARDENER, of two, for small, compost Garden on Bristol Channel, must be over age or ineligible.—Write to H. P., Box 5, 41, Wellington Street, Covent Garden, W.C. 2.

WANTED, GARDENER (HEAD WORKING), first-class man; two kept; thoroughly experienced Vegetables, ornamental Fruits, and Herbaceous; small Greenhouse and supervision of poultry and pigs; house (4 good rooms and scullery), coal, and vegetables. Full particulars of experience, wages, age, and family; also copies of testimonials of any.—PRESCOTT, High Lanes, Widdingham, Surrey.

WANTED, HEAD WORKING GARDENER for moderate-sized Garden; must have knowledge of electric light engine; good wages, cottage, coal.—Apply, S. H. A., Avon Carrow, Avon Dassett, Warwickshire.

NOTES FROM A GALLOWAY GARDEN.—XII.*

ALAS! for the wealth of Blackberries that has gone to waste this season for want of sugar to preserve them withal. Moreover, the dye works, whither in former years the "black boys," as they are called in Ayrshire and Galloway, went sent by rail in hundred-weights, have ceased to take them, being concerned, I suppose, mainly with the production of khaki goods. This is the occasion of loss to villagers and cottars, who have become accustomed of late years to draw a very fair profit from the hedges and sensible banks. Berries of nearly all kinds abound this year. A notable exception is *Cotoneaster frigidula*, of which there are many trees here 20 to 40 feet high. They were loaded with scarlet fruits after the wet summer of 1916; this autumn they bear hardly any. As for Rowans, a correspondent writes to me, "What would we not eagerly disburse for a Rowan tree if it came from some remote valley in China?" The golden-fruited variety, as I saw it lately at Pollok, in Renfrewshire, and again in a grimy colliery village in Lanarkshire, is a desirable variety. *Nantheoceras sorbifolia* (see fig. 60) has had a hard fight to retain its great nuts—bigger than a Horse Chestnut's—during the equinoctial gales. They withheld their beauty till they open, when they disclose rows of orange-tawny seeds resting on a couch of sleekest, whitest satin. The flowers of *Lonicera nitida*, introduced by Wilson in 1908, are fragrant, but inconspicuous. They are followed, however, by shining berries of an unusual colour—bright violet,

like beads of amethyst, and very attractive. The fruits of *Magnolia parviflora* are of extraordinary beauty, and, being borne on longish footstalks, render this charming shrub or small tree almost as conspicuous as when flowering in summer. The carpel is about 2 inches long, in colour a rich carmine; when ripe, it opens and discloses rows of scarlet seeds.

I have never seen the scarlet-fruited Elder (*Sambucus racemosa*) fruiting so freely in the United Kingdom as it did last year in Mr. F. R. S. Balfour's grounds at Dawyck, Peeblesshire. The trees, whereof there were many, were loaded with the brilliant berries, which struck me as remarkable after a miserably wet and cold summer. Mr. Balfour presented me with fifty seedlings, now 4 and 5 feet high. We shall await their behaviour next year with such patience as may be at command.

The handsomest of all the Day-lilies is *Hemerocallis aurantiaca* major (see fig. 58), not less to be esteemed because it delays display till late in the season. Last year it opened its first bloom on September 23; this season it started a day earlier. It is somewhat chary of flowers; a clump which has stood here for ten years or so is bearing but three flower-stems; but it atones in quality for lack of quantity, each head carrying about a dozen blossoms, opening in succession, the corolla being of great substance, of a rich and peculiarly luminous apricot colour.

Another autumnal flower of distinction is *Rubella maxima*, from Texas, which must have received its specific name before its Californian congener, *R. laciniata*, was classified, for it has neither the stature nor the coarseness of that species. From a tuft of fleshy, glaucous, lanceolate-leaves, measuring with their stalks 14 to 16 inches long, rises a flower stem to a height of 4 or 5 feet, with a few clasping leaves. The flowers are solitary or two on a stem, with clear yellow, ray florets and a cone of brownish-purple fertile florets $\frac{1}{2}$ inch high. Full exposure to the sun and a rich loam are the requirements of this most desirable plant, which is seldom seen in cultivation.

I am not greatly enamoured of the *Simulifera* family, but there is one, *Helianthus mollis*, which I first saw in the Cambridge Botanic Garden many years ago, and have never since been without. It wins favour by its moderate stature—4 feet or so—by the contrast between its soft, gray-green leaves and the rich golden flowers which it produces in a long succession from early in August till far into autumn.

In a former paper I drew heavily upon the vocabulary of vituperation in discoursing about the Knotwoods (*Polygonum*). Howbeit, there are two of this most prorean genus which are devoid of the vice of their rampant kindred and are greatly to be prized at this season. One is *P. vaccinifolium*, which spreads a close mantle over the stones of a retaining wall, and decks that mantle in September with crowds of erect, hoath-like

flower-spikes of lively pink. When the bloom is past, the plant is grateful for a liberal top-dressing of peat. Very different in habit and appearance is the other species, *P. equisetiforme*. It sends up a sheaf of slender, rush-like stems, 3 feet high, which become studded in autumn with small white flowers along two-thirds of their length. A graceful plant and desirable, which I owe to the liberality of Kew Gardens. As it does not appear in the *Hand List* for 1902, it may be presumed that it is of recent introduction. It seems not so hardy as could be wished. Of two strong plants here, one succumbed to last winter's cold, and the other, though green and vigorous, shows no sign of flowering, whereas it ought to begin in August. The same is the case with *Agapanthus umbellatus*, of which several clumps came through the winter without protection and apparently unharmed, but only one is flowering. A. Moore, on the contrary, was never more prodigal of bloom.

What we have known as *Montbretia*, but are bidden in the *Kew Hand List* to call *Tritonia*, is a beautiful autumn flower in many of its varieties, but it is embarrassing in its fecundity, springing up in places where it is not wanted, and smothering less robust growths with a cataract of leafage. It is too bright and friendly for utter banishment from the borders, though it lightens the woodland wayside finely, so we have readily adopted a course suggested by its own behaviour. A large, round bed, 25 feet across, filled with dark and light blue *Delphiniums*, was a very satisfying sight at midsummer, and the plants, having been cut over before going to seed, are now quite gay with a second bloom. Some vagrant bulbs of a *Montbretia* known by the sinister name "Germania" are haunting their flames among the blue Larkspurs, with telling effect; so with a view to autumn, 1918, we intend to dot them all over the bed.

Much of the charm of a border depends on the juxtaposition of flowering plants, and it is profitable to take note of such chance combinations as occur in such a disorderly, informal collection as we have here. For October effect the following are very gratifying: A bevy of blue-purple *Crocus speciosus* pushing up through a silvery carpet of *Cerastium tomentosum*; a tangle of pink *Polygonum affine* (*P. brunonis*) and light blue *Geranium Walli-chianum*; a furnace of *Kniphofia aloides* in a sea of snowy *Anemone japonica* *Honorine Jobert*; a crimson cascade of *Berberidopsis corollina* over *Crimm Powellii album* at the foot of the wall; the pink *Aster St. Egwin* alongside of sky-blue *Anemone Fischeri*; lastly, a group composed of *Cimicifuga simplex*, latest and best of Bugwarts, a sheaf of hybrid *Lobelia* of a rich carmine hue, and a clump of pale yellow *Kirengeshoma palmata* 4 feet high.

The first snow on our hill-tops on October 5 warns us that the flush of the year is drawing to an end. *Herbert Marshall, Monroith, Wigtonshire.*

* Previous articles appeared in the issues for Jan. 13, Feb. 17, Mar. 10, April 13, April 28, June 2, June 20, July 21, Aug. 28, Sept. 8, and Sept. 29, 1917.

ORCHID NOTES AND CLEANINGS.

LAELIO-CATTELEYA GATTON PRINCESS.

Mr. J. COLLIER, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey, sends us a flower of this very pretty and brightly coloured hybrid between *Laelia pumila* and *Cattleya Maunifii* (Bowringiana \times *Dowiana aurea*). The flower is 6 inches across, the sepals and petals

(*Dowiana aurea* = *Harrisoniana*) is also from Gatton Park, and presents another interesting instance of the domination of *C. bicolor*, for in size, shape, and most other particulars it closely approaches that species, notwithstanding the several larger and more ample species coming into its composition. The sepals and petals are of light lilac colour; the short, side lobes of the lip and the base are tinged with yellow and show

THE MARKET FRUIT GARDEN.

In September the rainfall was moderate, but sufficient, with the frequent morning fogs, to keep the land somewhat wet. Rain fell at my station on nine days, amounting to 1.50 inch. Urgent work in gathering and carting fruit prevented attention to the cultivation and hoeing of

FIG. 58.—HELMSFORDALLIS AURANTIFLORA VAR. MAJOR
(See "Notes from 'The Garden,' p. 155.)

of a light mauve shade, and the lip, which plainly shows *L. pumila*, reddish-violet with Indian-red base and yellow lines, the apex bearing a light lavender blotch. It is a very acceptable addition to the late-flowering Laelio-Cattleyas.

CATTELEYA ZONNEBEKE.

C. ZONNEBEKE, a new hybrid between *C. Adula bicolor* = *Hardyana*) and *C. Mrs. Pitt*

some raised orange-coloured lines traceable to *C. Harrisoniana*, the front being light mauve. It is probable that other plants of the batch will show more of the larger *Cattleya* form.

PUBLICATIONS RECEIVED. *On Fruit Bottling and Storing and on Vegetable Bottling and Storing.* Revised edition. By Royal Horticultural Society. (Wesley & Son.) 3d.

orchards almost entirely, and the growth of grass and other weeds, particularly Chickweed, was rampant. In the spring my orchards were remarkably clean, when most others were foul, as hoeing had been carried on up to a late date in last autumn. Now they are in worse condition than they have ever been before at any period of the year, except where there is a good plant of *Leucome*. Hoeing done since July has only checked weeds without killing many.

WORK CAUSED BY GALES.

The work caused by the two great gales of the latter part of August, and subsequent strong wind, has been tiresome and expensive. The picking up of windfalls alone consumed a great deal of time, and selection for marketing in addition. In order to release trays for the gathering of mid-season Apples, the windfalls to a great extent had to be placed in heaps wherever there was room for them under cover. Afterwards, when time was available, the heaps had to be tiresomely gone over to have rotting fruits taken out, and saleable Apples graded and packed. This work is not yet finished.

APPLES IN HEAPS.

The necessity of storing most of the windfall Apples in heaps has shown that they keep better so than in trays. There has been much less shrivelling of immature fruit in heaps than in trays, and no more rotting. The temperature during the greater part of September was too high to allow of even gathered Apples keeping well, and great quantities of mid-season varieties, kept for a few weeks in consequence of lack of empties, became over-ripe, and therefore depreciated in value. Some tons of windfalls and gathered fruit together rotted entirely, or to an extent rendering them unsaleable, excepting a limited quantity sold at 1s. per cwt. for cider. By-the-way, the few makers of cider in my district, makers only for home consumption, say that Apples rotted completely, if brown, but not black, make the best beverage. An agreeable surprise is the condition of Cox's Orange Pippins, blown down when not nearly mature, and stored in heaps. The best of them are firm, though they have lost their brightness, and are saleable at remunerative prices. Even thirds have made as much as the best of ordinary varieties.

SPECKED APPLES.

In addition to the rot spots alluded to in the *Gardeners' Chronicle*, September 22 (p. 121), numerous small specks have appeared on Domino and Duchess of Oldenberg. These specks, which developed entirely in store, though the cause of them apparently acted while the fruit was on the trees, are sunken, but do not cause any curvy degeneration of the cells under the skin as either Bitter Pit or Fruit Pit does. They do not look at all like scab, and there are hardly any typical scab marks and no cracks on Domino. They occur chiefly on shrivelled Apples. After a time a white mould shows on the specks. Thus, Mr. Salmon says, is "the *Hyphomyces* fungus *Cephalothecium roseum*," and is a very frequent cause of rotting. In all cases, he adds, it attacks the Apple where a spot of scab is or has been. This seems to assume that the specks are scab marks, in which case it is curious that there should be no large scab scars or cracks. Moreover, the specks did not show before the Domino Apples were stored, the fruit being remarkably clean when gathered. By-the-way, evidence as to the development of funguses attacks upon Apples in store being strictly development and not origination in store, is afforded by the fact that the specking is almost entirely confined to Domino and Duchess of Oldenberg, other varieties stored close to the two sorts named being quite free from specking, and almost free from rot spots.

IMPROVED PRICES.

The great glut of windfall and mid-season Apples had subsided by the end of September, and a considerable advance in prices has since taken place. Hitherto they have been much lower than they were last season, but scarcity will soon cause a great improvement, and probably late Apples, which are not generally a great crop, will become very dear before Christmas. Cobnuts also have gone up in price to a small extent, though still much below last season's value.

COBNUITS AND FILBERTS.

Why do market growers ever grow Filberts? These Nuts yield much less than Cobs, and sell regularly at 1d. per pound less money. In this we have one of the numerous instances of size affecting price more than quality, for Filberts are greatly superior to Cobnuts in flavour, and embody much less woody fibre. Although the foliage of Cobnuts was badly infested with caterpillars, the fruit is exceptionally fine and sound. The size is probably due to the wetness of the summer. Apparently the caterpillars included very few of the maggots which infest the kernels of nuts. *Southern Grower.*

PLUM VICTOR CHRISTIAN.

This new variety of Plum, which received the R.H.S. Award of Merit on the 9th inst., is a prolific bearer, as may be seen from the small branch illustrated in fig. 59. The fruits are dark purple, and resemble somewhat those of Monarch, of which the variety is probably a seminal or sucker sport. The fruits are only

of the more beautiful, which were recently at their best:—

H. SYRIACUS Totus albus—an exceptionally fine, pure white single flower; *colostriis*—a splendid single variety, blue, with crimson base to petals; it makes a fine standard; *flore roseo striatis*—possibly the finest and largest pink variety, flower blotched with crimson; *Hamabo*—generally one of the best, but not so good this year; pale pink with crimson base, single; *elegantissimus*—a semi-double variety, bluish, blotched with crimson; *monstrous*—a fine, very pale pink, single form; *albo plenus*—semi-double, white, with blotched base; it makes a good standard or half standard; *coerulea plenus*—single, pinkish purple; *Lady Stanley*—one of the best double; pink, with base blotched; *rubis*—single, colour ruby red; *forms fine bushes*; *Admiral Doway*—double white; *violet claire double*—pale violet, excellent as a standard; *Compte de Flan*—double, rose-pink; *Duc de Brabant*—rich double rose-pink; very effective as a half standard; *paony florus*—paony pink, double; a good half standard; *hybridus*—single; pinkish-white blotched with crimson; *bicolor hybridus*—

FIG. 59. PLUM VICTOR CHRISTIAN

(Photograph by R. A. M'Clay)

of moderate flavour, but they ripen later than most Plums, and the variety will be valuable for the late market.

TREES AND SHRUBS.

HIBISCUS SYRIACUS.

In spite of a dull, sunless summer, rarely, if ever, have I seen *Hibiscus syriacus* more beautiful than it is this year. Having been grown in this country for hundreds of years, and known as *Althaea frutex*, it is surprising that the shrub is not grown much more extensively than is the case. The plants will succeed in almost any soil or locality, are perfectly hardy, and they give a wealth of flowers when most flowering shrubs are over.

They make ideal plants for small gardens, as well as large, as they are somewhat slow growing and are easily kept within suitable bounds. Either as bushes, standards, or half standards, they are equally beautiful, and there are one or two varieties with variegated foliage which are wonderfully effective. I append a list of some

double pink, blotched; *rubra flore plenus*—a pinkish purple double; *pauciflorus plenus*—semi-double red; *minutiflorus plenus*—deep rose-pink, double; *Boule de Feu*—deep crimson, double; makes a good bush; *Amaranthus*—double; deep purplish pink; *albo luteolus plenus*—double; creamy white; *variegatus*—variegated foliage; flowers double; purple. *Edwin Beckett.*

THE FRUITING OF TREES AND SHRUBS.

In very few years is it possible to record such an abundant and very varied harvest of tree and shrub seeds. This is no doubt largely due to the weather conditions. In the first three months of the year, and notably during February, the conditions were colder and retarded growth; coupled with this there was an absence of late spring frosts, so that in the spring of 1917 the early-flowering trees and shrubs developed in suitable conditions. A few examples are worth placing on record, notably *Brica arbor* and *E. linstanica* (colonades), *Nyssa sylvatica*, *Nan'hoeris sorbifolia*, numerous species of *Lonicera*, *Penus cerasifera*, and *P. divaricata*, also many of the newer trees and shrubs introduced from China.

ON INCREASED FOOD PRODUCTION.

POTATO TRIAL.

A TRIAL of four different varieties of Potatoes has been carried out at St. Osyth's Priory Gardens, Colchester. I received two pecks each of the following varieties from Messrs. Austan and McAslan on March 3: What's Wanted, Great Scot and Scottish Triumph. I planted one rod of the following varieties on March 19: Scottish Triumph, Great Scot, What's Wanted, and Pink Blossom. This is the third year that Pink Blossom has been growing at the Priory; it is a splendid cropper and a good keeper when the seed is changed every second year. The results from the trial of one rod of each, planted with a space of 2 feet between each row and 15 inches between each set, all unsprouted, set 1½ oz., are as follows:—

	Per rod.	Per acre.
Scottish Triumph ..	360 lbs.	25 tons 18 cwt. 6½ lbs.
Great Scot ..	340 lbs.	22 tons 17 cwt.
What's Wanted ..	260 lbs.	18 tons 11 cwt.
Pink Blossom ..	250 lbs.	17 tons 17 cwt.

Scottish Triumph 10 cut sets = 45 lbs.; 10 uncut sets = 40 lbs.
 Great Scot .. " 41 " " = 34 " "
 What's Wanted .. " 25 " " = 22 " "
 Pink Blossom .. " 22½ " " = 25 " "

I may state that all cut sets were dipped in unslaked lime. The plants were sprayed twice throughout the season, and all were free from disease. The only artificial manure they received was ¾ oz. of sulphate of ammonia per lineal yard. Twelve people were present at the lifting and weighing. *Peter Murphy, Gardener, St. Osyth's Priory.*

POTATOS AND ONIONS AT KILMARNOCK.

MR. DEWAR, a plot-holder at Dankeith, near Kilmarnock, has grown a remarkably good crop of Cranston's Excelsior Onions. Four thousand seedlings were planted on a space measuring 33 yards by 14 yards, about the middle of April. The crop was lifted during the last week in September, and weighed 2 tons 5 cwt.; twelve of the largest bulbs together turned the scale at 28½ lbs. He also planted whole one tuber of Conquering Hero Potato weighing 18 oz., in a mound of mixed soil and leaf-mould. When lifted there were 75 tubers, weighing together 26 lbs. 4.

A SUCCESSION OF POTATO CROPS.

A CORRESPONDENT sends us an extract from the *Journal de Genève*, according to which it is possible to obtain a second or even a third crop of Potatoes from the same plant. To achieve this the *Journal* states that it is only necessary to dig the plant carefully, and after removing the fully developed Potatoes to replace it, when it will yield as large a crop as before. Although it does not do to be too sceptical, we feel a certain difficulty in accepting these statements if only because to obtain a second crop the plant must be dug whilst the haulm is still vigorous, and hence before the "first" crop has reached its full size.

ALLOTMENTS IN 1917.

THE Food Department has just issued details of the allotments in cultivation this season. Up to the 28th ult. the Department had received reports from 1,036 districts, in which allotments have been provided under the Cultivation of Lands Order. The number of "war time" plots is stated to be 130,066, representing a total area of 13,263 acres. In addition to these allotments, provided under special powers granted during the present year, many of the authorities concerned have been able to arrange on amicable terms with owners of land for large numbers of permanent allotments, and are proposing to lay out still further areas.

POTATO COMPETITION ON ALLOTMENTS.

THE Dumfries and District Horticultural Society instituted a competition among allotment

holders for the heaviest crop of Potatoes as lifted from a space of five lineal yards. The Potatoes were raised on the same day, and the lifting and weighing supervised by members of the Horticultural Society's Committee. The prizes were awarded as follows:—

DUMFRIES ALLOTMENTS.

1. S. Thom, Barkerland Allotments, 4 st. 4 lbs.
2. J. Ross, Annan Road Allotments, 3 st. 1½ lb.
3. Constable Killop, Johnstone Park, 3st. 6ozs.

MAXWELLTOWN ALLOTMENTS.

1. W. McAdam, Palmerston Allotments, 3 st. 1½ lbs.
2. J. Carruthers, Palmerston Allotments, 3 st. 7 lbs.
3. W. Currie, Portland Allotments, 3 st. 5 lbs.

Correspondent

A GOOD CROP OF BEET.

At the end of the first week of May last, agreeably to the desire of a new allotment holder, I bored holes for two lines of Beet, and sowed the seed. The allotment holder was not desirous of very large roots, though quality was a desideratum. Accordingly I allowed only a space of 18 by 12 inches for each root. A little manure had been placed over the gravel at a depth of 16 inches (the full depth of the soil), and one or two light dressings of sulphate of ammonia were given during the early period of growth. Fearing that the roots were getting too large, the holder dug them up on September 10. The largest root weighed 3 lbs., and 78 roots weighed 100 lbs. He found them of most excellent quality, but thought he would not require such a quantity, as his family had never used so many during the season they were in use. I replied that he might not use so much if he had to buy them. He had not seen it in that light before, and felt more than satisfied. *J. F.*

CELERIAC.

BEING interested in Mr. Edwin Beckett's remarks on Celeriac (see p. 146), I may say that I planted a batch on a plot of ground which had grown Shallots, harvested in the first week of July. The ground was simply hoed over and the Celeriac planted and well watered. I have pulled to-day some nice roots, a little larger than a cricket ball. I may say the ground was bastard trenched and given a little manure for the Shallots, and I am very pleased with the results. *W. Griffiths, Wild Wood Gardens, Clay Hill, Enfield.*

FRUIT AND CORN CROPS.

THE Shropshire and Staffordshire report to the Food Production Department for the week ending October 6 mentions that although the pulping station at Newport handled 55 tons of Damsons daily, the local crop was so heavy that much fruit was left to waste on the trees as not worth picking. Home-grown corn is coming steadily on the market in Lincoln, Rutland, and Nottingham; the condition is good, but the quality variable. Damsons here are abundant, the Pear crop is large, and the Apple crop, though less bulky, is of excellent quality. In Somerset the Apple crop was a record.

COOKING 'CHOU' RAVE (KOHLE RAMB).

1. Peel and cut in slices about ¼ inch thick, and cook till tender. Meanwhile, chop up all the young leaves, hold them slightly, strain off the water, and put them to stew with a white sauce. Drain the cooked slices, pour on the same, keep warm to compose a bit, and serve. 2. This may be used for older stems, which are becoming fibrous, if, after cooking, they are passed through a sieve. Fry a little steed onion till nicely browned, add some stock or gravy suitably seasoned, and then stew the cooked (sliced or mashed) vegetable gently till well composed. A large, maincrop variety, gathered early, is perhaps best. We find it stores well through the winter. *H. E. D.*

THE KITCHEN GARDEN

By J. DUNN, Foreman, Royal Gardens, Windsor.

WINTER SPINACH.—Thin out the plants of Winter Spinach to 3 or 4 inches apart. The leaves will then grow much larger and the plants will stand the winter better. Hoe the surface of the bed frequently, and if slugs are troublesome stand freely with soot in the early morning.

BEET.—The main crop Beet should be lifted as soon as possible and stored in some frost proof shed where a good covering of sand can be placed over the roots. Great care should be taken to lift this crop without injuring the roots.

WINTER GREENS.—Keep the hoe at work amongst all green crops while the weather is favourable. Remove decaying leaves from Brussels Sprouts as these plants will benefit greatly by full exposure to sun and air. Cauliflowers which are forming heads will require to have the leaves bent over the curds in case of early frost, but should not be severed from the plant, as they soon begin to decay, and may discolour the curd before they are noticed.

GLOBE ARTICHOKE.—As soon as this crop has been cut, the stems should be cut to the ground and all rough foliage removed. The ground between the rows should then be dug and allowed to remain rough and fully exposed to the weather until sharp frost sets in, when protection must be afforded.

MUSTARD AND CRESS. Small sowings of these salads should be made weekly in some slightly heated pit. Cover the seeds with paper for a few days, and when growth commences admit an freely, or the plants may be injured by the damp.

SEAKALE.—All decaying foliage should be removed from plants which are intended for early forcing, so that the crowns may be fully exposed to early frosts. When all the leaves have died down a few crowns may be lifted.

RHUBARB.—Lift a few strong roots of Rhubarb and expose them to the weather for a week or two before placing them in heat.

CELERY.—Continue to earth up late plantations of Celery, observing the directions already given for carrying out the work.

FRENCH BEANS IN POTS.—There should be no difficulty in producing French Beans in winter provided a light, well-ventilated structure is available where a temperature of 60° can be maintained. The soil may consist of three parts loam from a used Melon bed and one part decayed horse-manure, mixed thoroughly together. Use 7-inch pots, and after crocking them, three parts fill them with the compost, which should be pressed moderately firm. About seven Beans may be placed in each pot and covered 1 inch deep. Place the pots in the structure already described, and as soon as the plants are well through the soil place them near to the glass to ensure stocky growth. Later on weak liquid manure may be given freely, and the foliage should be syringed twice daily.

CABBAGE.—Continue to plant out Cabbage as the plants become large enough. Examine the beds carefully and make up at once all blanks with plants from the seed bed. Dust the plants freely with lime if slugs are present, and prick out all seedling plants remaining in the seed bed.

CARROTS.—Spring-sown Carrots should be lifted, or many of them will become too large and rough; these roots may be stored in a cool, dry shed until required for use. Later Carrots may be allowed to remain in the ground for some time longer. At Frogmore all late-sown Carrots remain in the ground until spring, and are pulled as required.

LETTUCE.—Plants in the open which are likely to be injured by frost may be lifted and placed in cold pits for use in early winter. Very

careful attention is necessary in order to retain a sufficient quantity of soil on the roots to keep the plants from flazzing, and a good watering should be given to each light after the plants are put in position to settle the soil about the roots. The pit should never be closed unless a frost likely to injure the plants is expected. Young Lettuce plants of hardy varieties, such as Maximam, may still be planted on a warm border for spring supplies. The border should be well raised at the back, so that no water may remain on the surface during the winter.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gaton Park, Reigate.

SHADING.—The roof-blinds may now be removed from the divisions containing such Orchids as Cattleyas, Laelio-Cattleyas, Dendrobiums, and the Mexican Laelias. The Laelias are now producing their flower spikes, and need all the sun light possible. The blinds may be allowed to remain for a week or two later on houses containing Odontoglossums, Masdevallias, and Phalaenopsis, as they may still be required for an hour or so in the middle of bright days. Canvas blinds that are no longer needed should be stored in a dry shed, and in spare time in winter be given any small repairs that may be necessary. If lath blinds are used they may remain, and be let down over the roof glass on cold nights; it will economise fuel.

TEMPERATURES.—For the next few weeks the temperature of the East Indian or warmest house, at night, should be about 70°; that of the Cattleya house about 65°; the Mexican or intermediate house a few degrees less, and the Odontoglossum house about 55° or 57°. These readings should be maintained only when the outside temperature does not fall below 45°. In the event of very cold nights a few degrees lower may be permitted. Frost may occur suddenly in the early mornings, causing the temperature of the various houses to fall a little below the proper degree. On such occasions no water should be afforded the plants, neither should damping be done until the houses are sufficiently warm again, as a cold, moist atmosphere causes spot and disease in the foliage.

THE HARDY FRUIT GARDEN

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVEY, Abbots Wood, Glastonbury, Stroud.

PEACH AND NECTARINE TREES.—Gather any fruits still upon the trees, and put them to ripen in a box with some wood wool in the bottom, and place the box on a warm and dry shelf. Cut away any laterals or superfluous shoots. Should the ground close to the wall be dry give it a good soaking, and at the same time syringe the trees with an insecticide. The earlier trees should have a light twiggy hick branch drawn lightly over the foliage to shield any loose leaves, so that the sun may shine on every portion of the tree. Any trees to be shifted should be transplanted at once.

FRUIT GATHERING AND STORING.—If Apples and Pears are gathered and selected with care the work in the fruit room will be reduced to a minimum. At the present time several varieties of Pears and Apples are ready for use. They should be kept in a cool room, although Pears are never when eaten with the chill off, especially in the cold months. The varieties are—Hardy, Bourne Superfin, Gault's Bergamot, Triomphe de Vienne and others all ripen and are at their best in October. In Apples James Grieve and St. Edmund's Pippin—the latter a very agreeably flavoured variety—American Mother, Lord Rossberg, a fine, highly coloured fruit, are also ready in October. All these do well when grown as bush or pyramid trees. Later Apples, when gathered, should be placed in backward positions—that is, on the floor and on the top shelves, which are the coldest, leaving the middle stages for those which are to be consumed first, and as these stages are cleared the tops and bottoms can be thinned to continue to make a show, as Apples will bear being laid

several layers on top of each other. Plenty of air should be kept on the fruit stores to allow the moisture arising from the fruits to escape.

STAKES FOR YOUNG TREES.—Any replanted trees should be given strong stakes to keep them steady during the gales, which are usual in autumn; if this be done it is surprising how quickly the trees in new positions will take hold of the soil, especially if the work is done early.

CUTTINGS OF CURRANTS AND GOOSEBERRIES.—Cuttings may be put in now. Choose straight shoots, and in Red and White Currants strip off the buds to within 3 inches of the top, but not so with Black, as these should be encouraged to grow from the base. Make a small trench with a spade, and if the soil is wet and heavy put in some old rotting shod soil which has been passed through a fine-meshed sieve. Put the cuttings of about 8 or 9 inches apart and well tread them in; firm planting is essential.

STRAWBERRY QUARTERS.—Keep Strawberry beds free from runners and cross weeds.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to Lady NORTON, Eastwell Park, Kent.

BUSH CHRYSANTHEMUMS.—Late varieties grown for blooming about Christmas-time, may be kept outside a few weeks longer, but measures must be taken to protect them in case of bad weather. If wooden supports are provided, canvas covers or old blinds can be used at night, or, failing either of these, a double thickness of fishnetting. Water the plants before midday, so that they will not be saturated at nightfall.

FREESIA.—The light material placed on the surface, when the balls were potted, to keep the soil in a uniform condition, should be removed as soon as new growth can be seen. Give them all the light and air possible during mild weather to ensure a steady growth. When the weather turns cold, those required to flower early in the winter should be placed in the greenhouse on a shelf or stage near the glass. Be careful not to overwater the plants in the early stages of growth. Later, when the pots are full of roots, plenty of water may be given, and a little weak manure water and root water about twice a week. Support the plants with net stakes before they begin to fall about a temperature of 50° to 55° at night will be ample, with an increase of 10° in the day by daylight.

THE FLOWER GARDEN.

By W. J. GIBBS, Gardener to Mrs. DUNSTON, Keele Hall, Staffordshire.

PAEONIES.—The planting of herbaceous Paeonies should no longer be delayed, and if the severity of the autumn prevents the work being done, it should be postponed for another year rather than be done in the spring, when the root produces a mass of young fibres, making it impossible to lift and replant them without injury. When dealing with a number of large roots in these gardens last year, the positions for planting were well trenched and a liberal quantity of decayed manure and leaf mould incorporated with the soil. The roots were carefully lifted, and parted with the aid of two small border forks, the crowns being split into sections of four or five eyes. The eyes were planted just below the surface, and a mulching of manure and decayed leaves placed over them. The weather during the spring was certainly in their favour, for rarely have I seen herbaceous Paeonies give so good an account of themselves.

PERENNIAL LARKSPURS.—Although Delphiniums are not so exacting as Paeonies, plants lifted, divided, and replanted at once will certainly have the advantage over those planted in spring. As the soil is still warm, the plants will get well rooted and established before severe weather sets in. Young plants in reserve quarters should be transplanted to their permanent positions; they like a rich, light soil, and a fairly open situation sheltered from high winds.

Plant the crowns about 2 inches below the surface, and make the soil moderately firm about the roots.

THE ROSE GARDEN.—Cut out all old and exhausted wood from Rose plants, and complete the final tying in of the young shoots.

FRUITS UNDER GLASS.

By JAS. HENSON, Head Gardener at Gunnersbury House, Acton, W.

THE TOP-DRESSING OF POT FRUIT TREES.—For top dressing pot fruit trees it is advisable to use a little more manure with the soil than would be used in repotting. Let it be well decomposed, so as to encourage root action as quickly as possible. Proceed firstly removing the top-dressing of the past summer, and then with the scratcher, alluded to in my recent notes, carefully work amongst the older roots and endeavour to get down at least 3 inches into the old ball. In doing this preserve intact as many of the roots as possible, not only those in the top dressing but also those in the lower part of the soil, and carefully lay them out after a little fresh soil has been added; then incorporate the roots with this as equally as possible. Press the soil down quite firmly and apply at the least one good watering. Look closely to the drainage holes and see that they are free. If there are any indications of worms in the pot add some lime to the water and watch for the appearance of the worms on the surface.

EARLY FIG TREES IN POTS.—There is no better plan for securing an early crop of Figs than by growing a good batch of trees in pots, selecting the variety St. John's or Pango de Mel; it is immaterial which of these be chosen, for the fruits are similar, and both crop equally well. Later on the fruits of the second crop are not alike in this respect, for the last named variety has then more conical fruits than the former. If any forcing is to be attempted of these Figs no time should now be lost in paying attention to their needs at the roots. Every alternate year is ample for repotting, or every third year even, if they are grown in pots of large size. When potting them, however, do not be afraid to reduce the balls freely, whilst care fully preserving the roots. If larger pots are deemed advisable use them by all means, but be moderate in providing for fresh root extension. After repotting, or top dressing, as the case may be, keep the stock in a cold house, but one that is absolutely proof against frost. These Figs, if closely fairly close together, may be protected from any risk of draught by covering them with leaves, but not sufficient to cause any fermentation. Should insect pests be troublesome, take an early opportunity of cleansing the wood down to the base, and use the insecticide Early strong; a soap lather is a good penetrating insecticide after an application of water as hot as the fingers can bear without discomfort.

LATE FIGS NOW BEARING.—Make the most of the late Figs, for they are a most valuable acquisition to the dessert. Keep the stock in a temperature of 60° to 65° Fahr. Guard against any superfluous atmospheric moisture, but see that the plants do not suffer for want of water at the roots. At the time of writing we are picking both Negro Largo and Bourpasseotte Grise in quality, and they have never been better in quality. These two late Figs cannot be surpassed for October consumption if given a fairly warm treatment to mature the fruits.

YOUNG FIG TREES.—Those who may have a stock of Fig plants propagated from cuttings last January will now do well to let them go to rest, even if a few fruits should still remain upon them. Gradually reduce the watering and the heat and remove them to a cooler house. Later on do not be sight of these young plants, and on no account let them stand outside. Do not attempt any repotting of these until growth commences again. For the present do not do any pruning, but let them first go quite to rest. After another season's growth in pots a selection of these may be made, and be trained accordingly, for planting out in borders of limited dimensions. These will be better than raised or stunted plants.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41 Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would oblige by delay in obtaining answers to their communications and are as much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41 Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 46°.

A-TUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, October 26, 10 a.m.: Bar, 29.2; temp., 45.5; W. other Bright sunshine.

SALES FOR THE ENSUING WEEK.

MONDAY—
Bulls at 67 and 68, Chapside, at 1 o'clock, by Protheroe & Motter's.

WEDNESDAY—
Teale Sale of Bulls at Protheroe & Motter's rooms at 1 p.m.

FRIDAY—
Bulls, at Protheroe & Motter's rooms at 1 o'clock.

of Paradise stocks should be set on a scurper basis than that on which it rests at present. For as Thomas Hitt sagaciously observed more than 150 years ago, "stocks are in some measure a sort of soil to the kinds of trees raised on them," and, needless to say, the value of an Apple plantation depends not only on the varieties of scion, but also on the kinds of stocks on which these varieties are grafted.

The experiments at East Malling, the fruit station of Wye College, were begun by Mr. Wellington in 1912, and have been continued since 1914 by Mr. Hatton. Throughout the whole period of the experiments Mr. J. Amos has acted as foreman assistant and recorder. The objects of the experiment were to isolate the different kinds of Paradise stock, to define their several characters, to work up stocks of each kind sufficient for testing their values on a large scale, and to determine which stocks are the best for different purposes.

Needless to say, the carrying out of such a programme must inevitably be a task of many years' duration, and hence we must look on the present contribution as an interim report, and hope that the importance of the advance made will lead to the recognition that much larger resources should be placed at the disposal of the East Malling station.

The first step in the carrying out of the programme just referred to consisted in determining the distinguishing characters of the types. For this purpose detailed comparative examination of the stocks in the dormant as well as in the growing season was made. As a result, eight distinct types of Paradise stocks may be recognised. They are:—The Broad-leaved English Paradise, the Doucin, Rivers' Nonsuch Paradise, the Improved Doucin (Doucin Amélioré), the French Paradise, and three others unnamed, of as yet unknown origin. In addition to these, the collections included two uncommon and uncertain types and a new French type—the Paradise Jaune de Metz, recently introduced into this country. Collections from Germany contained also several new unnamed sorts; so that in all 15 types of Paradise have been isolated.

Omitting the types which appear to belong to hitherto undescribed forms of Paradise, there remain nine which may be easily recognised. They are:—1, Broad-leaved English; 2, Doucin; 3, a stock identified by Mr. E. A. Bunyard as *Malus pumila*; 4, unnamed; 5, Improved Doucin; 6, Rivers' Nonsuch Paradise; 7, unnamed; 8, French Paradise; 9, Paradise Jaune de Metz. Each of these types is illustrated in Mr. Hatton's paper both by means of photographs of shoots showing summer characters, by figures giving the relative size and general leaf characters and by pictures of the root systems. With this excellent series of illustrations before him the nurseryman should have no difficulty in determining the true type to which the majority of his Paradise stocks belong. In this he is assisted by Table III., which gives the

winter characters of each of the nine types, and by Table IV., which records the summer characters.

Very full and careful records have been made of the essential characters of the root-system; for the value of a stock for a particular purpose must depend more on the nature of the root-system than on any other single character. A useful summary of the characters of the nine types brings out the striking differences between them and raises a number of interesting questions, among which one of the most important is whether the Doucin so widely used is worthy of an important place among Paradise stocks, and if so, whether it is suitable only for some soils.

In commending this valuable report to the attention of fruit growers we venture to support the author's suggestion that the work on which he is engaged will receive the co-operation of nurserymen and growers. We are sure that the investigations at East Malling deserve that co-operation, and we believe that if it is given there will be a general improvement in the Paradise stocks of the country. This, of course, is but one of the many subjects of economic importance which require investigation. The fruit growers of the country have a unique opportunity for pressing for fuller recognition and assistance of their industry by the State. In the present and prospective food shortage the importance of home-grown fruit has become of great importance to the community, and it can only be by systematised research in a sufficient number of well-equipped fruit stations that outstanding problems, the solution of which would increase the fertility of our orchards, can be solved—and then only if growers and nurserymen co-operate in the planning and carrying out the necessary investigations.

FLOWERS IN SEASON.—Messrs. ALLWOOD BROS. send us flowers of their hybrid Dianthus, which they state are from a cross between perpetual-flowering Carnations and the garden Pink. Flowers were shown at the R.H.S. meetings in the spring, when the question of the perpetual-flowering habit of the hybrids was discussed. The present flowers prove that the plants bloom well into the autumn, and specimens have been exhibited at the R.H.S. Shows almost continuously since the early part of the year. Some unnamed seedlings exhibited prettier tints than we have previously seen in the cross.

TILLAGE PROGRAMME FOR ENGLAND AND WALES IN 1918.—The Board of Agriculture appeals to farmers to increase, as compared with 1916, (1) the area under corn by 2,600,000 acres, (2) the area under Potatoes and Mangolds by 400,000 acres, (3) arable land by 2,000,000 acres.

THE SURVEYORS' INSTITUTION.—The first ordinary general meeting of the Session 1917-18 will be held on Monday, November 12, at 5 p.m., when the president, Mr. ARTHUR LYON RYDE, will deliver an opening address.

DAMPING OFF OF SEEDLINGS.—Experiments made by Messrs. C. HARTLEY and R. G. PIERCE* indicate that beside the methods of soil sterilisation by heat or by formalin the addition to the

All who grow Apples, whether for profit or pleasure—and most of us grow them for both—will find in Mr. R. G. Hatton's account* of his investigations into the different kinds of Paradise stock much valuable information and much to stimulate observation and reflection.

That there is pressing need for a thorough investigation into this subject would, we think, be immediately conceded by fruit growers; but if any there be who are satisfied with the present state of our knowledge on the variety and characteristics of "Paradise stocks," we commend to their attention Table I. in Mr. Hatton's paper. In that table is set out first the names under which some 35 British and foreign nurserymen sent in collections of stocks. Examination of these stocks showed the looseness with which the names are used. Thus, the name Broad-leaved English Paradise was used 21 times—18 wrongly and three rightly. English Paradise was used five times—in each case wrongly, and generally for Doucin. The Broad-leaved English Paradise was in some cases used for the most vigorous of Paradise stocks and sometimes for the most dwarfing. If these things are done in the "green tree" of knowledge by some of the most expert nurserymen, it is evidently high time that our knowledge

* Journal of the R.H.S., Sept., 1917.

* U.S. Dept. of Agric., Bull. 453.

soil of commercial sulphuric acid, at the rate of 1 fluid ounce to the square yard, is useful, at all events, in soils not containing too much lime. If the soil is dry the acid should be added to 2 pints of water, and the mixture watered in, and if wet 1 pint of water is sufficient.

SPEEDING-UP GERMINATION.—Experiments made by Professors MOORE and HAYES at the School of Agriculture, University of Minnesota, appear to indicate that the fumes of nitrobenzene accelerate germination of Maize seed and lead to the production of more vigorous seedlings. The seed is placed in a closed box in which is suspended a cloth which has been soaked in nitrobenzene.

ULMUS PUMILA.—Among the notable "plant immigrants" described by Mr. DAVID FAIRCHILD is *Ulmus pumila*, the Chinese Dry Land Elm. The figure of this Elm represents a

specimen 27 feet high grown from a cutting five years ago. The species has shown it all remarkably resistant to cold and drought, and withstands the rigours of the climate of Iowa and the Dakotas. It is no less at home in "the rainy winters and cool summers of the Puget Sound, the intense dry heat of the interior valleys of Northern California, and the humid subtropical summer climate of the Gulf States." Truly a most accommodating tree.

FIG. 100. FRUITS OF XANTHOXERANTHUS SORBIFOLIA (SIEB.) NAGAI, from the Garden of Golein, p. 180.

specimen 27 feet high grown from a cutting five years ago. The species has shown it all remarkably resistant to cold and drought, and withstands the rigours of the climate of Iowa and the Dakotas. It is no less at home in "the rainy winters and cool summers of the Puget Sound, the intense dry heat of the interior valleys of Northern California, and the humid subtropical summer climate of the Gulf States." Truly a most accommodating tree.

DUTCH SEED PROSPECTS.—Messrs. SEDIJS and GHOOR send us from their seed grounds at Enkhuizen, Holland, a report on the prospects of the harvest in various vegetable seeds, as follows: Cauliflower. Attacked by disease and spoilt by rain; small crop expected. Cabbages. Adversely affected by the severity of the winter; crop very small. Turnips and Beets

afterwards by excessive rains; the crop will be scarcely average. Dwarf and Runner Beans. Crop promises to be good. Broad Beans. Injured by drought; crop will probably be small. Sorghoma. Very little seed. Corn Salad. Almost destroyed by frost. Celery. The condition of this crop leaves much to be desired, and the crop will probably be negligible.

AGRICULTURAL MACHINERY IN PALESTINE.—The *Journal of the Royal Society of Arts* states that a memorandum prepared by the Arab Bureau in Egypt contains some interesting information on the subject of agriculture and supplies in Palestine. A good deal of dry scientific farming is carried on in the neighbourhood of Jerusalem, the ground being kept loose by continual tillage. The Arabs do not use harrows, but the Jewish colonists have introduced the harrow and American pulverisers with beneficial results. The ploughs chiefly in use in Palestine are the primitive Arab plough and the

German plough. British ploughs are said to be too heavy and of unsuitable shape. In the orangeries and other plantations American ploughs are exclusively used. The use of the American disc harrow is common, and American harvesters are in fairly general use even among the Arabs, whilst the Jews employ American binders. In the Jaffa Orange district the irrigation of the new groves is effected by means of pumps operated by oil engines. Most of these are of British make (3 to 3 h.p.), and it is estimated that there are about three hundred of them.

WAR ITEMS.—An exhibition of Chrysanthemums was held under the auspices of the Elgin District Horticultural Society on October 10 in aid of the Red Cross Fund. There were also numerous classes for fruit and vegetables. The exhibition, which was organised by Mr. F. L. MAXX, the secretary, and other local helpers,

was highly successful, the sum of £110 being realised.

With regret we learn of the death of Private W. EASLEY, son of Mr. W. EASLEY, Danerholt Nursery, Eastwood, Essex. He was killed instantaneously by a shell whilst performing the duties of stretcher-bearer during heavy shell fire. His officer writes: "A finer man I never met; he was absolutely upright and brave." Private EASLEY was a keen lover of Roses, and assisted his father in his nursery. He leaves a widow and one child.

— Private GILBERT EREY, of the Australian Forces, now in Bethnal Green Military Hospital, suffering from a broken arm and leg sustained in the fighting on the Ypres front, is well known to readers of the *Gardeners' Chronicle* by his occasional notes on Lilies and other plants contributed prior to the war. He is a keen gardener, and his garden, near Melbourne, is full of interesting plants.

* *Plant Immigrants.* No. 125, Sept., 1916, U.S. Dept. of Agric., Washington.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

EIGHTEENTH-CENTURY CATALOGUE. Will Mr. Roberts give a list of the varieties of Apples and other fruit mentioned in his rare old catalogue, including any descriptive efforts that there may be? Besides being of interest to many, it would be worth while recording more details than so unique a catalogue. *D.*

GUNNERAS IN THE NORTH (see p. 152).—I have reason for believing that Gunnera scabra could be grown all round the eastern and northern seaboard of Scotland from Aberdeen to Wick. Even on the northern coast of several counties to the south of the Morra Firth the climate is relatively mild, and snow seldom lies long. There was a plant of *G. scabra* in a private establishment in the early seventies, and during three years, while under my observation, it did no special treatment beyond a small heap of leaves over the crown during winter. It was grown in one of the herbaceous borders, and had no feeding whatever, but was sheltered from the north by a Beech hedge. The plant grew robustly every year, and was about 5 feet high, with the characteristic erect leaf-stalks. In those days it was more the plant of the specialist than the general cultivator who grew plants for their flowers or the fragrance of their foliage. This garden was about nine miles as the crow flies from the nearest seaboard, in a river valley, and the winter was mostly always severe. *J. F.*

BHENDI AND BRINJALS.—I am sure your numerous readers have been interested in Sergeant Aldridge's notes on "Gardening in Eden," but many of them may not be able to identify the fruits by their Oriental names, although they are often seen in Covent Garden. The former name, Bhendi, is Okra, okra Gombo, Gombar (various spellings of all these words). Hibiscus esculentus (*Malvaceae*), growing about 5 feet and with cut foliage, producing pods 4 to 6 inches long, something like the form of a long red Capsicum, but more sharply pointed and rather angular; they are used in the green state, and held in much esteem by the natives of India in making Bendi Kai and by imparting a mucilaginous thickening to soups; but it is considered heating, and leads to dyspepsia and constipation; the leaves are sometimes used as puffers. It is a native of the West Indies, and long naturalised in India. The plant yields a strong and plant fibre, and is well suited for the manufacture of ropes, strings, and paper. It would probably not succeed in the open ground nearer to England than a climate like Provence. Some members of the same genus produce good root plants; one is the source of Cuba Bast, which was much used in English gardens before the introduction of *Raphia*, Mahaut, H. arborous, Ambasi Hemp, H. cannabinum, Blue Mahoe, H. elatus, Rozelle Hemp, H. Sabdariffa, Brinjal, "Aubergine," "Egg Plant," Solanum Melongena. The Garden Egg is of various shapes and colours, but usually the above names are applied to the long and round purple varieties. The scarlet, white, striped and black are grown as ornamental pot plants in this country, the white variety being the most typical of the name. The purple varieties are generally cultivated in Oriental countries from Turkey to China and India, also in the United States, and are common fruits in baskets in the markets of New York and other cities. Mr. W. Roberts, in the *Gardener's Chronicle*, September 22, 1900, gave an interesting description, quoting, *inter alia*, from *Gard. Mag.*, 1826, as follows: "They are generally used in the East Indies in curries and made dishes, but the usual and best mode of dressing them is, first, to parboil them, and then dividing them lengthways, to scum them across and across with a knife, to dress them with butter, salt, and pepper, and to broil them on a gridiron." The latter some may have become more familiar than the Aubergine in French and English cuisines. *J. Harrison.*

SCALE INSECTS AND AMERICAN BLIGHT ON FRUIT TREES.—As frequent mention of these pests is made in all gardening papers, it may

interest readers to know of a very simple and effective method I have employed to destroy them. Some years ago, noticing during June that an Apple tree did not thrive as I thought it should, I closely investigated it to discover the cause. The leaves and ends of the branches showed no sign of insect or fungous attack, but I found the lower part of the branches and the whole of the trunk so thickly covered with brown scale insects as to touch one another. As they were of the same colour as the bark, I had not previously noticed them. Thinking I had a tough proposition before me to exterminate them, I determined upon a kill-or-cure experiment. So I made up a very strong mixture of crude Santal and water, and thoroughly scrubbed every part from the ground upwards to beyond where I could detect a scale insect. Allowing the specific to dry upon the tree, I then thoroughly painted the trunk and branches with linsed oil. The result of this treatment was that during that year the tree showed no signs of injury, nor any apparent improvement, but the next year it entered upon its vegetative period with great vigour, began to throw off the old bark, and ever since has increased in vigour of growth and fruit production. The one application of the remedy was quite sufficient, for the scale insects seem to have been exterminated. Patches of the Woolly Aphis or American blight appeared upon another tree during the same year. Knowing how very deadly oil is to all insects, I soaked the colonies of American blight with linsed oil. This completely destroyed the pest for the season, but in subsequent years it has sometimes reappeared, when a dose of oil at once destroys it, without appearing to harm the tree in any way. I think it very probable that if I had painted the scale-infected tree merely with oil it would have been quite as effective. However, the fact remains that the remedy was perfectly effective, without in any way injuring the tree. *N. E. Brown.*

SWEET PEA SPIKE WITH SEVEN BLOOM.—I send you a photograph (not reproduced) of a Sweet Pea with seven blooms, grown by Mr. Cooper in the garden of the Horton Red Cross Hospital, Gower, Glamorgan. *J. E. F. Benson, Enry Hill, Revaldston, R.S.O., Glamorgan.*

CONTROL OF SLUGS.—In reply to Mr. Pearson I hope to put an article together on the subject. When I used to collect them actually, I soon gave up counting, and estimated by the pint and quart. *H. E. Durham.*

ROYAL HORTICULTURAL

British Fruit Show.

(Continued from p. 154.)

DIVISION V.

SPECIAL COUNTY CLASSES.

There were eleven classes in this section, open to Kent in county by itself, groups of other counties, and Scotland, Ireland, and the Channel Islands, respectively. In each case prizes were offered for 6 Apples, 4 culinary and 2 dessert varieties, also for 6 dessert Pears, of distinct varieties.

KENT.—*Apples.*—The only exhibitor was the Rev. J. R. LEIGH, Yalding Vicarage, and he was awarded the 1st Prize. *Pears.*—The Rev. H. A. BULL, Wellington House, Westgate (ex Mr. F. King), had the better of two exhibitors, and was awarded the 1st Prize. His fruits of Bourré Bachelier, President Roosevelt, Bourré Alexander Lucas, and Princess, were excellent.

SURREY, SUSSEX, HANTS.—*Apples.*—Mr. W. H. SMITH, West Dean Gardens, Chichester, had the best of eight exhibitors with highly coloured fruits of Pears-of-the-Noneseuch, Gloria Mundi, Warner's King, Lord Derby, Rival (very fine), and Chas Ross; 2nd, Rev. McMURDIE, Wolm Park, Wealdridge (ex Mr. A. Basile), *Pears.*—The Rev. McMURDIE excelled, beating

four others, with splendid fruits of Le Brun, Souvenir du Congrès, Pimaston Duchess, Durondeau, and huge specimens of Marguerite Maripault; 2nd, Lady MARY MORRISON, Tisbury (ex Mr. H. H. Mills), whose finest dish was Durondeau.

WILTS, DORSET, SOMERSET, DEVON AND CORNWALL.—*Apples.*—Major F. J. B. WINGFIELD DIGBY, Sherborne Castle, Dorset (ex Mr. T. Taitton), was placed 1st for immense fruits of Gloria Mundi, finely coloured Hollandbury, The Honiton, Cox's Orange Pippin, and others; 2nd, JOHN COPP, Esq., Teignmouth. *Pears.*—Major WINGFIELD DIGBY also showed best in the Pear class, in which Lady MARY MORRISON was placed 2nd.

GLOUCESTER, OXFORD, BUCKS, BERKS, BEDS, HERTS AND MIDDLESEX.—*Apples.*—Sir EDWARD PEARSON, Brickendonbury, Hertford (ex Mr. W. Stephenson), won the 1st Prize, Emperor Alexander, Ribston Pippin, Peasgood's Noneseuch and Bramley's Seedling being unusually good. *Pears.*—Sir EDWARD PEARSON also showed the best Pears, and was awarded the 1st Prize.

ESSEX, SUFFOLK, NORFOLK, CAMBRIDGE, HANTS AND RUTLAND.—*Apples.*—Only two competed, the 1st Prize being awarded to C. H. BERNERS, Esq., Ipswich (ex Mr. W. Messenger); his best varieties were Chas. Ross and The Honiton; 2nd, Sir R. SHAFFO ADAM, Bart., Flixton Hall, Suffolk. *Pears.*—These competitors were reversed in the class for Pears.

LINCOLN, NORTHAMPTON, WARWICK, LEICESTER, NOTTS, DERBY, STAFFS, SHROPSHIRE AND CHESHIRE.—*Apples.*—Only one competed in this section—MARK FIRTH, Esq., Carlton Park, Market Harborough (ex Mr. R. W. Thatcher).

WORCESTER, HEREFORD, MONMOUTH, AND WALES.—*Apples.*—W. J. GRESSON, Esq., Seven Stoke, Worcester (ex Mr. T. Parry), had the better of two exhibitors, his fruits of Chas. Ross being highly coloured and those of Peasgood's Noneseuch very large; 2nd, Mrs. SMART, Aberystwyth (ex Mr. R. Rogers). *Pears.*—Mr. GRESSON also showed the best Pears.

SIX NORTHERN COUNTIES AND THE ISLE OF MAN.—*Apples.*—Only two competed, and the 1st Prize was awarded to Mr. W. ORR, Silverdale, Lancashire, whose fruits of Chas. Ross, Red Victoria and Loddington were well coloured for such a northern district.

SCOTLAND.—*Apples.*—Capt GORDON, Threave House, Castle Douglas (ex Mr. J. Duff), was the only representative from Scotland. His fruits were very good, and, as showing how much later the season is for Apples in Scotland, those of Lady Sudeley, Worcester Pearmain, Castle Major and British Queen were in the pink of condition.

IRELAND.—*Apples.*—Ireland was represented by two good collections, the best from the Rt. Hon. the Earl of BESSBOROUGH, Piltown, Co. Kilkenny (ex Mr. S. E. Tomlin); 2nd, Earl of Drogheda, Pears.—Mr. HUGH INNES, Stewart Institute Gardens, Palmerston, Co. Dublin, showed small but good quality fruits of Pimaston Duchess, St. Luke, Douvenc du Comice, and Durondeau; 2nd, Earl of BESSBOROUGH.

AFFILIATED SOCIETIES.

As at last year's exhibition, the only exhibitor in this class, which called for six varieties of culinary Apples, six of dessert Apples, and six of ordinary Pears, was the Ipswich and District Gardeners' Association, and the 1st Prize was well merited.

SINGLE DISH CLASSES.

The number of exhibits in each class is given in brackets. The 1st prize winners were as follows:—

DESSERT APPLES.

Adam's Pearmain (10): Duke of WELLINGTON, Southfieldsaye, Mortimer, Berkshire (ex Mr. C. Matthews), *Millington Pippin* (17): A. E. CUMBERBATCH, Esq., Ware Park, Herts (ex Mr. F. W. Miles), *American Mother* (9): Duke of WELLINGTON, *Barnack Beauty* (8): Duke of WELLINGTON (finely coloured), *Ben's Red* (5): C. H. BERNERS, Esq., Wolverstone Park, Ipswich (ex W. Messenger), *Bleahem Pippin* (15): E. E. PALMER, Esq., (the best coloured and most regular of the fruits shown, though not the

largest). *Charles Ross* (19); W. J. GRESSON, Esq. (the best wretched fruits, and of high quality, but not very large). *Clayton's Pippin* (5); F. J. LANDSELL, Esq., West Woods, near Wimborne, Dorset. *Constitution* (9); F. J. LANDSELL, Esq. (a superb dish of fruit). *Lord's Orange Pippin* (24); Major WINGFIELD-DIGBY. *Egmont Russet* (4); Major WINGFIELD-DIGBY. *James Grieve* (10); JOHN CORP, Esq. *Lord Handley* (5); Lady MARY MORRISON (the largest and best fruits). *Myriad* (5); F. C. STOOPE, Esq., West Hall, Blythe, Surrey (gr. G. Carpenter). *Robinson Pippin* (19); MARQUIS OF RIXON, Compton, Christ. Kingston Hill (gr. T. Smith). (A superb dish of this old favourite, red all over.) *Royal Red* (16); Lady MARY MORRISON (the largest and best fruits shown in this class, and of high colour). *St. Edmund's Pippin* (4); Major WINGFIELD-DIGBY. *Wealthy* (15); E. E. PALMER, Esq. (there was a great divergence of colour among the exhibits, some being all red, others only striped). The fruits in the winning dish were very pretty).

ANY EARLY VARIETY NOT NAMED ABOVE.
FIT FOR USE.

(24) 1st. F. C. STOOPE, Esq. (*Governor*).

ANY LATE VARIETY NOT NAMED ABOVE.

(25) 1st. C. H. BERNERS, Esq. (*Winter Robinson*); 2nd. F. C. STOOPE, Esq. (*Broadland's Biscuit*).

COOKING APPLES.

Beauty of Kent (5); Rev. T. M. MURDIE, Bournemouth (6); Sir ED. PEARSON, *Blenheim Pippin* (7); F. WEST, Esq., Hackwood Park, Basing stoke. *Brandy's Scuddling* (10); Duke of WELLINGTON. *Cellini* (5); Mrs. C. M. NORDEN, Longfield, Loughton, Essex (gr. G. Gilbert). Very highly coloured. *Dunbar's Scuddling* (8); Duke of WELLINGTON. *Eden's North* (5); Duke of WELLINGTON. *Empress of Australia* (9); Sir ED. PEARSON. *Empress of North* (10); Sir ED. PEARSON. *Paishanger Gardens* (one of the finest dishes in the show). *Golden Noble* (3); Sir ED. PEARSON. *Granadina* (4); Capt. GORDON, Thravay House, Lisle, Douglas (gr. J. Duff). *Harold Pippin* (5); Duke of WELLINGTON. *John's Prince Albert* (15); A. E. CUMBERBATCH, Esq. *Lord Debach* (8); Rev. J. R. LUGH, Yalling, Kent (gr. G. Johnson). *Mary's Mince* (10); Sir ED. PEARSON (large fruits of fine quality). *Newton Wonder* (4); Duke of WELLINGTON. *Pearquod's Snowsuck* (9); MAEK FIRTH, Esq., Carlton Park, Market Harborough (gr. R. W. Thatcher). *Patt's Scuddling* (4); Major WINGFIELD-DIGBY. *Royal Jubilee* (5); W. H. SMITH, West Dean Gardens, Chichester. *Stirling Castle* (5); MARQUIS OF RIXON. *The Queen* (9); Sir ED. PEARSON. *Warrant King* (9); F. WEST, Esq. (an excellently contested class).

ANY VARIETY NOT NAMED ABOVE.

(15) 1st. E. E. PALMER, Esq. (huge fruits of *Charles Ross*); 2nd. Lady MARY MORRISON, with Rev. H. Wilks.

DESSERT PEARS.

Bourri d'Amaltes (4); F. WEST, Esq. *Bourri d'Amaltes* (2); C. H. BERNERS, Esq. *Colden Park*, Surrey (gr. G. A. Kember). *Bourri Rose* (5); Major WINGFIELD-DIGBY. *Bourri Handley* (3); Major WINGFIELD-DIGBY. *Bourri Superba* (5); C. H. BERNERS, Esq. *Charles Ernest* (2); C. H. BERNERS, Esq. (smaller, but beautifully coloured fruits, were shown by F. R. ROOD, Esq.). *Concord* (12); G. F. MANSIE, Esq., Wallington (very large fruits). *Doyenne du Comice* (17); HARRY SHURLEY, Esq., Bownside, Coldham, Surrey. *Durand's* (7); Rev. THOS. McMERDIE. *Easter Pear* (4); F. WEST, Esq. *Emile d'Hyet* (5); C. H. BERNERS, Esq. *Fondante d'Autonne* (5); C. H. BERNERS, Esq. *Fondante de Thibaut* (6); Rev. THOS. McMERDIE. *Gloria Marcon* (6); Rev. THOS. McMERDIE (large and well-coloured fruits). *Josephine de Malines* (8); Sir ED. PEARSON. *Louise Bonn of Jersey* (3); G. F. MANSIE, Esq. *Marie Bonnet* (5); Major WINGFIELD-DIGBY. *Marie Louise* (8); Rev. T. McMERDIE. *Nouriel Fédée* (3); Major WINGFIELD-DIGBY. *Painstons Duchess* (13); C. H. BERNERS, Esq. (very large fruits of good quality). *Souvenir du Congrès* (2); Rev. T. McMERDIE. *Thompson* (no entries). *Triomphe de Vienne* (2); C. H. BERNERS, Esq. *Winter Nélis* (5); Major WINGFIELD-DIGBY.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

SEPTEMBER 20.—At the meeting held on Thursday, the 20th ult., the members of the Committee present were: The Rev. J. Crumple (moderator in the chair), Messrs. D. A. Cavan, J. Cypher, A. G. Ellwood, J. Evans, A. J. Handley, J. Howes, A. Keeling, D. McLeod, W. Mackleton, H. Thorpe, and A. Arthur (secretary).

First class certificates were awarded to the following novelties:—

Obontoglossum crispum Xanthotes Nadine and *O. President Edouard*, from W. R. LEF, Esq. *Cattleya Doreen Watson* & *Pittman*, from Miss S. GREENIE.

Sepholo-Cattleya Fehous & *C. Doree* & *C. Fabian*, from S. GREENIE, Esq.

Laetia Cattleya G. G. *Widdielegia longicauda*, from J. J. BOLTON, Esq.

Cattleya Venus The Knowledge (no. 1), from JOHN HARTLEY, Esq.

Sepholo-Laelia Cattleya The Bell (no. 1), *L. C. Marston* & *C. Fabian*, from P. SMITH, Esq.

Cattleya Thora unguicula (*Empress Frederick* & *Mrs. Pitt*), from J. WALKER, Esq.

AWARDS OF MERIT.

Trips, *Cattleya Bona The Knowledge* (no. 2), *B. C. Marston* & *C. Fabian*, and *Odin Henry Thompson* (no. 1), from J. HARTLEY, Esq.

Obontoglossum emblema (no. 1), *Royal Garden*, from J. J. BOLTON, Esq.

Cattleya W. Pitt (no. 1), *Louise*, from W. R. LEF, Esq.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

OCTOBER 2.—The monthly meeting of the Society was held in the B.H.S. Hall on the 2nd inst. Mr. C. H. Carter presiding. Two new members were elected. Two members withdrew from the Society, accounts the sum of 251. The stock for the month on the ordinary subscription to £42 11s., and on the share section £16 15s. 4d., and maternity benefits to 43. The meeting resolved itself into a special general meeting for the purpose of considering the amended rules of the Juvenile section, and these were adopted unanimously. The monthly meetings will take place at 7 p.m. during the winter months, instead of 7 p.m.

CROPS AND STOCK ON THE HOME FARM.

HARVESTING THE MANGOLD.

NOW that we have had the first taste of frost none may be expected at any time, and many Mangolds were spoiled by frost last year, not only during the winter months, but also before the roots were pulled. It will not be wise to risk the loss of a part of the present crop. Some say that frost does not injure Mangolds in a heap, even though they are frozen, provided they are allowed to thaw without interference. I have never seen frozen roots rot away, but they always come out in a rotten mass. The Mangold crop this year is a heavy one, probably it has never been exceeded, although the season of growth has not been ideal owing to a lack of sunshine; at any rate, in the Southern Counties. One cause of the heavy crop is no doubt the energy put into the matter, and early sowing. After the death of food during last spring, many farmers realised that the Mangold crop would be especially valuable, and thus devoted an extra share of manure to the land.

Mangold roots are easy to pull; they leave the ground readily, generally without soil attached. The most expeditious method of pulling the roots is to seize the tops some 3 inches from the crown with the left hand, and with a large knife sever the leaves within an inch or so of the crown; with the same action throw the roots into a heap of about two wheelbarrowful, working round the heap, dropping the leaves close to the heap. The roots are piled up cone shape, and by nightfall they are covered securely with the leaves, which are sufficient to ward off several degrees of frost. Usually the heaps are allowed to remain several days, or a week at the most, where they dry somewhat, and are in a better condition for storing than when put straight into a heap as pulled.

There are various ways of storing Mangolds. Where frost proof sheds or barns are available, no method is more economical in labour and in no way do the roots keep better, if they are freely ventilated for some time after storing, to dissipate water vapour arising from slight fermentation. I have seen Mangolds stored in barns 50 feet wide and as much as 10 feet high, and which came out quite sound in April. While, however, such conveniences do not exist, the old-fashioned method of clamp building can be utilised, and there is none better when properly carried out. Usually the clamps are made in the field where the roots are grown, to save cartage. Select a site as near the gate as possible, and if at the side which is sheltered from north winds all the better, as this necessitates less protection from that quarter. The width of the clamp at the base may be 6 feet or more up to 9 feet, building up in cone shape to a point, using, of course, the larger roots for the walls. The most expeditious method is to tip the cart up in the middle of the heap, working from the middle in two gangs to the opposite ends.

When the heap is complete, cover with straw, or, what is better, Barley or Oat chaff, which lies closer together, and naturally wards off more frost. A covering of straw will tend to keep the covering dry, which is not so liable to frost penetration as when wet. If there is danger from rain, a coating of soil 1 foot thick, dug from a trench around the clamp, should be put on three parts of the way up the clamp, leaving the apex open for the escape of moisture for at least two or three weeks, when the whole may be covered with straw and soil, introducing ventilators on the top of the ridge at every 6 feet, made either of straw bundles through which the steam will arise, or, what is better still, 4-inch drain pipes fitted on the top of the ridge. As long as the steam can escape, Mangolds will keep sound until August provided, of course, the covering is sufficient to keep out frost. A good plan is to thatch the soil, especially on the north side, which keeps it dry, and the clamp is then absolutely secure from frost. *E. Molyneux.*

WOMEN WORKERS ON THE LAND.

A PRACTICAL test of efficiency for women farm workers, organised under Government auspices, was carried out at the Metchley Park Farm of Messrs. A. J. Follows and Son, Edglaston, Birmingham, on the 4th inst. The test was intended to be an examination, and not in any sense a competition, match, or demonstration. The farm on which the tests were made is situated on high land about three miles to the west of Birmingham, and consists of upwards of 260 acres, 40-50 of which were placed at the disposal of the Committee.

The weather was most unsuitable for land operations, rain falling almost continuously throughout the day, and at times the downpour was unusually heavy, but the women stuck to their work in a thoroughly businesslike way. The general arrangements were in the hands of a Committee, of which the Lord Mayor of Birmingham is chairman, whose interest in the success of the scheme was very pronounced. The actual tests were arranged by practical farmers, who also acted as judges. About 250 workers—strong, healthy, active, and keen at their work—were drawn from a dozen Midland counties. The largest number of candidates from any one county was 62, from Warwickshire. The women were attired in trousers, leggings, loose coats reaching to the knees, and soft felt hats, and were grouped according to their skill and length of training. In order to gain the Board of Agriculture certificate of efficiency, it was necessary to get 75 per cent. marks, while candidates who obtained 70 per cent. received the Highly Commended certificate.

In the general labourers' tests 160 candidates entered for the pulling, cleaning, and piling Mangolds; 100 or so, in the hoeing and singling roots; 16 hay trussing; 20 thatching; 70 landing and unloading straw; and 40 mowing by hand, including whetting scythes. The women handled the implements deftly, and carried out the work expeditiously.

In the tests for waggoners, which included grooming, harnessing, and driving single-horse-wagon, backing it into position between pegs,

there were 35 entries: 20 for ploughing (pair of horses abreast); 15 for ridging; and 15 for drilling. The tests for cowmen were very popular, about 150 women entering for the milking by hand and by machinery, which included stripping cows and cleansing machines, etc. Milking commenced at 5.50 a.m., and all the 60 candidates satisfied the judges, who awarded the maximum number of marks to two women, and over 90 per cent. to 22 others. In the tractor ploughing test, candidates were required to drive the tractor and ride the plough alternately, two tests for each operation. They also had to set the plough, which was a by no means easy task under such trying weather conditions, but the opinions of the judges were quite favourable to the workers. It is proposed to continue these tests in other countries.

ENQUIRY.

MARKET TOMATO.—Will someone please tell me what variety of Tomato is most grown for the London market? L.

REPLY.—Many growers are cultivating the new Kundine Red variety, which gives excellent results as a market sort. Others still rely on such older varieties as Comet and Sunrise, whilst many have selections of their own from the older types of market varieties. A good market fruit should be of moderate size, possess a smooth skin and solid flesh, with few seeds, thus weighing well. If it is of better flavour than the generality of Tomatos so much the better. T.

"There are few gardeners, and still fewer amateurs, who do not on occasion require immediate information upon various points of practice. But either from an unwillingness to enquire or from not knowing of whom to make the enquiry, they too often fail to obtain the information they are in want of. And let no one be alarmed lest his questions should appear trifling, or those of a person ignorant of that which he ought to know. He is the wisest man who is conscious of his ignorance; for how little do the wisest really know—except that they know little. If one man is unacquainted in a subject however common, it is probable that hundreds of others in the same position as himself are equally in want of similar information. To ask a question, then, to consult the good of others as well as of one's self."—*Gardeners' Chronicle*, No. 1, Vol. I, January 2, 1851.

CARROTS: E. L. Carrot-roots are apt to split when cultivated in soil containing much animal manure in a state more or less fresh. Again, if they are left in the ground after attaining full size and wet weather ensues they are also liable to split. We cannot tell which is the cause in your case, but would advise you to select for this crop next season soil that is sufficiently rich to need no fresh application. A free sandy soil is suitable, rather than a clayey medium, or one containing rough gravel.

EARTH WORMS IN POTS AND GREENS ON LILICUMS: Amateur. The worms may be introduced with the fresh top-dressings of soil, or, as you suggest, in the water. Worms are frequent in the material, such as gravel and shales, used on greenhouse stages, after it has remained undisturbed for some time. Send a specimen of the Lily bulb for examination.

FRUIT BOTTLING: J. E. C. Provided the rubber rings are sound they may be used a second time or oftener, but they should be thoroughly cleansed and sterilised in hot water.

FUNGUS ON A LAUREL: W. J. C. The specimen was too old and out of character when it reached us to determine the name of the fungus.

LILICUM ROOTS AFFECTED WITH INSECTS: W. S. Send a specimen for examination.

LILAC AND PLUM DISEASED: J. E. C. The fungus *Cephalothecium roseum* and a Botrytis are present on the Lilac leaves, but these fungi are not likely to cause whole branches to die. There is no fungus present on the bark sent;

the markings on it are the lenticles. The Plum tree attacked with "silver leaf" should be uprooted and burned.

LIST OF APPLES: M. R. H. There is nothing but Dr. Hogg's *Fruit Manual*, now out of print, and costing, second-hand, 25s. to 30s., but not easy to find. We could get you a copy of Leroy's *Dictionnaire de Pomologie*, section "Apples," but, of course, the text is in French, and the lists include mostly French varieties.

NAMES OF FRUITS.—In the naming of fruits, we desire to oblige our correspondents as far as we can, but the task would become too costly and too time-consuming were there no restrictions. Correspondents should observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones; if two of each variety are sent, identification will be easier. The fruits should be just approaching ripeness, and they should be properly numbered, and carefully packed in strong boxes; cardboard is often smashed in the post. A leaf or shoot of each variety is helpful, and in the case of Plums, Peaches and Nectarines, absolutely essential. In all cases it is necessary to know the district from which the fruits are sent. By neglecting these precautions, correspondents add greatly to our labour and run the risk of increased delay and incorrect determination. We do not undertake to send answers through the post, or to return fruits. Fruits and flowering plants must not be sent in the same box. Delay in any case is unavoidable.

Pra Bona Publica. Pear over-ripe—A. H., Wokingham, 1, 2 and 4, Apple Cox's Orange Pippin; 3, Pear Louise Bonne of Jersey; 5,

FIG. 61.—STEM TUBERATION IN POTATO.

King of the Pippins; 6, Beurré Clargéau; 7, small fruit of Beurre d'Amanlis.—A. L., Apples: 1, Peasgood's Nonesuch; 2, Spessing-Wine. The Pears were over-ripe—P. L., 1, Kerry Pippin; Crab not recognised.—J. M., 1, American Mother; 2, Old Nonesuch; 3 and 7, Hermaid Pearmain; 4, Henry Morning (striped); 5, Dutch Codlin; 6, Norfolk Beauty.—H. W., 1, Wadhurst Pippin; 2, Ross Nonpareil; 3, Annie Elizabeth; 4, Lady Henrick; 5, Melrose; 6, Dutch Mignonne.—Mrs. H., Pear Beurré de Capiaumont.—G. R. I., Annie Elizabeth; 2, Beauty of Kent; 3, small, not recognised; 4, Waltham Abbey Seedling; 5, Royal Russet; 6, Herefordshire Pearmain; 7, Cullen.—Shropshire, 1, Domino; 2, not recognised; 3, Tower of Glammis; 4, St. Edmund's Pippin; 5, Hawsell Souring; 6, Winter Hawthornden.—J. Mills, 1, Margil; 2, Domino; 3, Potts's Seedling; 4, Old Hawthornden; 5, Newton Wonder; 6, Beauty of Kent; 7, Small's Admirable.—F. G. M., 1, Tower of Glammis; 6, Cox's Orange Pippin; 11, Lord Derby; Pears: 20, Beurre Bosc; 17, Louise Bonne of Jersey.—C. W., 1, Allington Pippin; 2, Yorkshire Beauty; 3, Worcester Pearmain; 4, Potts's Seedling.—J. H., Cornish Mother.—J. G. B., 1, Lady Snidley; 2, Small's Admirable; 5, Woodcock; no number, Tower of Glammis.—F. W. O., You have not observed the rules in sending so many fruits. Those not named are either over-ripe or too immature to show the characters. 34, 25, Williams' Bon Chrétien; 4, Pitnaston

Duchess; 17, small fruit of Doyenné du Comice.—R. B., 1, Vinouse; 2, Colmar d'Été; 3, Beurre Diel.—F. R., 2, Cornish Gilliflower; 3, Ribston Pippin; 4, Nonesuch; 5, Lord Derby; 6, Ryken Pippin. Pears decayed.—J. B. E., Wivel.

NAMES OF PLANTS.—Correspondents not answered in this issue are requested to be so good as to consult the following number.

R. C., *Salvia Horminum*.—W. M., *Cotoneaster frigidula*.—J. K., *Rhamnus catharticus* (common Buckthorn).

PEARS DEFORMED AND DISEASED: Hy. D. The Pears are attacked by "type rot." A species of *Penicillium* is present, and this or some other fungus is the cause of the decay. In all cases the disease enters the fruit through some wound, such as punctures made by wasps and cracks due to scab disease.

PLANTS FOR CARPETING BRICK RUBBLE: Amateur. Besides Sedum acre, you could employ *Cerastium tomentosum*, *Arabis*, *Aubrietas*, and mossy Saxifragas.

POTATO CROP: A. L. The fault was not in the soil, or the plants of Midlothian Early would have failed. "The Factor" tubers may have got chilled before you put them into the ground. If this was not the case then they suffered some other kind of check that had the effect of destroying fertility whilst leaving them with extraordinary capacities for growth.

POTATO WITH STEM TUBERS: E. Bros. The specimen you send is not uncommon. The underground tuber of a Potato is nothing more than a modified stem or shoot, and it is not surprising that these thickened shoots should sometimes be produced above ground. The illustration in fig. 61 shows one of these aerial tubers in the axil of a leaf.

SEAKALE: E. B. The blanching of Seakale out-of-doors is done by means of special pots, inverted over the roots. These are usually covered with fermenting material, which gives rise to sufficient heat to cause the plant to grow more quickly than it otherwise would. As a rule, the earliest Seakale is produced from crowns lifted and forced indoors, the outdoor plants coming into use just as the indoor supply is exhausted.

SEEDLING APPLE: J. T. Mason. We have cooked the specimens you sent us, and find that their culinary qualities are very good. Moreover, being fairly sweet, they needed less sugar than many Apples usually employed for cooking; the variety is sufficiently attractive to be considered by some people good enough for dessert. It might be worth your while to submit specimens to the Fruit and Vegetable Committee of the Royal Horticultural Society at their next meeting, on October 23. The address of the secretary is Vincent Square, Westminster, S.W. 1.

SPRAYING POTATOS: C. Your African Chief Potatos should not have been injured by ordinary spraying, and the injury must have been primarily due to some circumstances which it is not possible to determine except by someone on the spot. Perhaps the ingredients of the spray fluid were too strong, or the haulms of the Potatos may have been injured in turning them from side to side for the purpose of spraying. It was quite correct to spray them, although they had shown no signs of disease.

VIOLET LEAVES DISEASED: W. S. N. The plants are infested with the disease known as *Ascochyta violae*. Burn all plants which show the symptoms, sterilise the soil, disinfect the frames, and plant fresh stock. When the new plants are well established, spray them about every fortnight with potassium sulphide, at the rate of one ounce to three gallons of water.

Plants, and post free. **DOBBISS & CO., R. D. FLEMING,**
BIRMINGHAM.

THE DIFFERENCE between a good adver-
tising medium and a bad one is a frequent subject
of discussion among those who are determined to
get the best use out of the money they spend on pub-
licity, but, in the end, it resolves itself into the differ-
ence between wealthy readers and poor ones. Those
who are advertising cheap goods naturally turn to a
journal with an enormous circulation, even though it
may be composed of people of middle-class means. But
those who supply the thousand and one necessities of
a large garden, find that such a journal presupposes a
mode of woman of means is the one who can afford to
run a garden itself, but a staff of permanent
gardeners to tend it. To such a saleswoman, a journal
which goes to the hands of the amateur, or even a milliner,
of small people, is next to useless. He should turn rather
to a journal, such as the "Gardeners' Chronicle," which
reaches the right people, the keen professional gar-
deners and the wealthy amateur. The response of such
readers to a well-written advertisement is immediate
and satisfactory.

SANDERS, Orchid Growers,
St. Albans.

PHILOX. Finest varieties in cultivation.

ALLWOOD BROS., Carnation Specialists, HAYWARD'S HEATH

APOLOGY.

17, TRANQUIL VALE,

BLACKHEATH,

October 14, 1917

DEAR SIRS,

IN answer to your letter of the 13th referring to the issue of your flats, I am very sorry that such a mistake should occur, but I told my man to look up some copies to return to market, and also send some of my copies down to Essex to bring some fruit up to me, but, in mistake, he sent some of your flats which, of course, I shall see that it does not occur again.

I am,

Yours respectfully,

(Signed) MR. NOBLE

MESSRS. GEO. MONRO, LTD., Covent Garden, London.

DOVER ROAD,

FOLKSTONE.

October 16, 1917.

MESSRS. GEO. MONRO, LTD., COVENT GARDEN, LONDON.

DEAR SIRS,

WE hereby acknowledge, using your Chamber flats to send them to growers for purposes of our own business, and now acknowledge that this was a mistake on your copies, and also an infringement of your trade mark.

We, therefore, consent to have this letter published in the *First Trade Journal* and the *Gardeners' Chronicle*, at our expense, and will guarantee not to make any such use of your copies in future.

Yours faithfully,

(Signed) SWOFFER & CO.

BOOKS WANTED.

PLANT COLLECTING IN CHINA.

Mr. George Forrest, who is still collecting in China, has sent the following letter to the Director of the Royal Horticultural Society's Gardens. It was written at Shienmalata, Tsodjong, Upper Mekong, N.W. Yunnan:

I AM camped in the house of a Tibetan farmer, an old friend of mine of 1905. The house is on a small flat, 4.6 acres, situate in a big bend on the left bank of the Mekong, approx. lat. 28° 25' N. The valley here is a mere gorge, some 2,000 feet in depth, flanks angled to 70°, air stagnation and climate almost tropical. On every side we are enclosed by mountains, the divides rising to about 15,000 feet, with isolated peaks, such as the sacred mountain, Dekor In and Ka-quo-pu, which lie only a few miles to the north of 20,000 feet or even more, snow-capped and glacier clad! It is a difficult and trying country to work in. At our feet runs the Mekong, a raging ever-coloured torrent of 200 yards breadth, with a ten knot current, rising and falling like a gigantic pulse, 16 feet or more, day by day.

Tzkon, the scene of my adventure with the Lunas in 1905, lies a few miles south, whilst to the north, a few hours' journey, is the frontier of Sarong.

Above a certain altitude in this region of the Yunnan province the genus *Rhododendron* is the dominant feature in the scheme of vegetation, and species of that genus will bulk largely in my collections this year. The herbaria I have now in hand number 7,800 species, and in looking over my field book I find fully 20 per cent. of the total numbers represent *Rhododendrons*.

My journey from Lichiang to Atuntze was very successful. Portions of the route, of course, gave little or no result, such as the long descent from the Chungtien plateau to the Yangtze, and from thence to the foothills of the Bei-ma-Shan. There for several days' journey the country is arid to a degree, the strata tip-tilted, clay, slate, and sand formations, which refuse to hold moisture. The character of climate, and consequently flora, is very similar to that portion of the Yangtze Valley crossed on the way from Lichiang to Yangling, on the eastern arm of the big bend. Xerophytic shrubs and forms of hill types, dwarfed and contorted by their environment almost out of recognition, are abundant, with a herbaceous flora equally characteristic, and including *Ipomoea*, *Aroids* and *Composites*.

However, the flora of the higher portion of the Chungtien plateau and that of the Bei-ma-Shan compensated fully for the non-productiveness of other areas, and I secured fully 200 species new to my previous collections, mostly trees and shrubs, for it was too early in the season for the higher Alpine flora, consisting of the most interesting and valuable herbaceous plants. Many of the shrubs should prove of horticultural value. On the list are 4 new *Loniceras*, 2 *Leptodermis*, 2 *Perusis*, 2 *Daphnes*, 3 *Prunuses*, 2 *Abelias*, 2 *Diapensias*, 1 splendid *Fraxinus*, 1 *Poplar*, 1 *Syringa*, several *Enocyanuses*, several good *Berberises*, 3 rare *Caraganas*, and 2 *Ostryopsis*, of all of which I hope to get seed.

Of herbaceous material, I found several *Primulas*, a fine new species of *Solms-Laubachia* with rose-pink flowers, the beautiful *Atenome glauciplylla* Fr., and another with deep purple blooms; a new *Trollius*, a fine new *Astragalus* of compact, prostrate habit, silvery-grey foliage, and exceptionally large flowers of a deep, wine-red colour. But, as I say, it was too early in the season for the flora of the Alps. However, I hope for great things from the Bei-ma-Shan. A party of my men are now there, and will collect for several weeks.

The wealth of *Rhododendrons* is almost incredible, and the number of new species and forms found more than confusing. I have really given up attempting to define the limits of species; each individual seems to have a form, or an affinity, on every range and divide differing essentially from the type. I secured a very great number of these.

In that region *R. Traillianum* seems to be the dominant species. It is so plentiful on the eastern slope of the Bei-ma-Shan that its flowers give a silvery-grey appearance to the range, visible many miles distant. The range of colour is great, from deep rose through shades of pink to pure white. It is one of the most abundant species, as well as one of the finest in N.W. Yunnan, extending from the Tali Range to as far north as I have explored, lat. 28° 10' N.

Forms of the dwarf intricate and fastigiate types were legion and clothed

all the uplands, giving a very home-like touch to all the higher altitudes. Take the moors and hills surrounding the head waters of any of our principal highland streams in the early spring, those in full flood, with patches of snow around; for Heather and Heath imagine mile upon mile of dwarf *Rhododendron*, at that season almost the exact brownish shade of dry Heather, and you have the scenery of the summit of the Bei-ma-Shan, alt. 15,000 feet. The raw, damp wind strengthened the impression for me, and, as I stood there my heart warmed to it, and I could almost imagine myself at home.

On those highlands the dwarf *Rhododendrons* were not then in flower, but, at lower altitudes, the moorlands of the Chungtien plateau were covered with many forms of *R. fastigiatum*, in full flower and in many shades, from the deepest purple-blue through lavenders to bright rose-pink. At those lower altitudes the shrubs seem to thrive best in marshy situations, and some of the boggy flats on the margins of the Pine forests which clothe the surrounding hills were ablaze with the blooms of *R. hippophacoides*, *R. scintillans* and what I took to be the true *R. fastigiatum*. Those flats are generally bordered by Birch saplings, and again the charming combination drove my thoughts homewards for comparisons, reminding me, bar the colour, of just such flats as we have in the highlands where Heather and Birch grow in company. I secured fairly good photographs of some of the scenes.

On the higher portions of the plateau I rode for several days through breadths of *Pavonia lutea*, and after seeing so much of it I am quite of Mr. Gumbleton's opinion that *P. lutea* is only a form of *P. Delavayi*. At least 50 per cent. of the plants I saw bore blooms either blotched deep crimson at base, or more or less flushed with that shade throughout. Yet I did not find the type *P. Delavayi* anywhere. However, form or not, those plants with the pure canary-yellow blossoms are most desirable, if one could be sure of the seed being pure. Previously I had only seen the plant on the Tali Range, where it is much dwarfed in every way. On the Chungtien plateau it attains the same height as *P. Delavayi*, 24 feet, or even more, with correspondingly bold foliage and large flowers.

On the hills towards the north end of the plateau beyond the town of Chungtien, *Daphne aurantiaca* was the dominant shrub, by far eclipsing the very fine display it makes on the Lichiang Range. The masses of golden-orange blooms, swarming the foliage, and visible at quite a considerable distance, gave one the impression of a hillside covered with Gorse. From what I saw I think the species must fruit much more freely than further south.

Further on, in like situations, the place of *D. aurantiaca* was taken by a very fine and most floriferous species of *Caragana* No. 13756, a shrub of 36 feet, flowers golden yellow, with the standard tinged ruddy brown. Another fine shrub found at the same place is a prostrate

species of *Cotoneaster*, with glossy, box-like foliage and deep crimson flowers. The species forms mats several yards in diameter and blooms very freely.

In the lower valley of the plateau I found many shrubs: a *Daphne* sp., a fine shrub of 4-6 feet, with pale yellow, fragrant blooms and scarlet fruits, No. 15,769; a *Fraxinus* sp., a tree of 40-50 feet, with large, deliciously fragrant racemes of creamy-yellow flowers, a very handsome plant, No. 15,797; a new species of *Melicope*, far excelling *M. cuneifolia* in appearance and wealth of bloom.

One of the finest forest shrubs, and also of the open, is *Pyrus* sp., No. 15,844. It is a shrub or tree of 10-35 feet, with large, fragrant, pure white flowers, produced in great abundance.

lighter contrast in colour, the grey limestone background setting off the dazzling vermilion blooms to perfection. This may or may not be *A. Azooi*, as the Kew authorities say, but, if so, it is then a most luxuriant form of it; heads were noted bearing as many as 50-70 blooms.

On marshy land and by streams I saw and photographed what I take to be *Primula fasciculata* Balf. fil. It is a charming little bog plant, of 2-3 inches, with deep rose-pink blooms, which have an orange-coloured eye. It resembles *P. tilotica*, but has no scapes, the flowers arising on solitary pedicels from the axils of the leaves.

In marshy, open glades in Pine forests I saw and also photographed the so-called yellow form of *Primula Cockburniana*. Personally I consider it more closely allied to *P. Bulleyana*. It

From the 1914 collecting we already have the purple and lavender shades, but I marked down many of the rose-coloured forms.

On the descent from the Bei-ma-Shan I came on *Primula minor* in large numbers, and in full flower. It is a shade plant, and very beautiful, nestling in large colonies on dry banks in the shade of *Rhododendron* bushes; the soil is a light vegetable loam. The flowers are a very pleasing soft shade of lavender-rose, with the eye yellow and very fragrant. A new species, akin to *P. lichiangensis*, was also collected there.

On the highest point of the pass, *P. compranthe* Balf. fil., was seen in great quantity but not in full flower. There, also, on moist, stony drift, was found a new species of *Salix* *Lau-bachia*, with beautiful rose-coloured flowers.

But above 12,000 feet the chief feature in all the scenes was *Rhododendrons*, from forests of tree species such as *Rhododendrons Traillianum* and *phacochysum*, to moorlands carpeted by the dwarf species and excluding all other shrubs.

In the more open Pine forests were many species, old friends and new, *R. paralbum*, *R. Wardii*, *R. Bessianum*, *R. pagophilum*, and *R. oestrophes*, all in the perfection of bloom.

One of the finest new species of the *Intricatum* set, a shrub of 12½ feet, has brilliant yellow blooms, produced most lavishly, and was seen in masses, acres in extent, *R. saluense*, flowers deep lake-crimson; *R. acratum*, flowers blue-purple; *R. dianctum*, flowers deep purple; and others, were abundant.

Around Atuntze a week's collecting produced quite a number of novelties, and many fine, though already known, species of *Rhododendrons*, and several new species of the *Cephalanthoides* group were secured. Some excellent *Primulas* were collected, two of which belong to the *Dryadifolia* section, fine "cushion" rock plants; another, new, allied to *P. bella*, with deep lake-coloured flowers; and several of the *Nivalis* section, one of which much resembles *P. Fendleri*.

A most interesting find was a form of *Stellera chamaejasme*, with perfectly white, fragrant flowers. So far, it is unique, as I have not found the type thus far north. There are two species of *Meconopsis*, one of which is, I think, a form of the variable flowered *M. racemosa*; the other a dwarf, with blue flowers, and new to me.

The hills enclosing the Atuntze valley, which is merely a gutter, are very barren and devoid of soil, rising to some 2,000 feet above the level of the town, i.e., 15,000 feet, but the summits and the alpine slopes beyond seemed to me fairly promising, though it was too early in the season to form a definite opinion.

However, according to programme, I pushed on here, and so far I have not been disappointed.

I have very good reports of all the men on the various stations, and I expect to profit much by them, especially those at Tai and Tengyuch. The men at the latter place are working the Shweh Salwin divide, 11,200 feet in height, than which I know no richer in the province.

FIG. 62. GINKGO BILOBA AT BLAISE CASTLE

A good *Crataegus*, No. 15,885, was evident in most open thickets, of good habit, much resembling the common British Thorn, but bolder in every detail, and with a light, ruddy lark.

Populus sp., No. 15,825, is an excellent tree, growing almost to 90 feet, with great girth and spread, and large, fine foliage. It is not abundant, but may be found near many water-courses.

In the dry region beyond the plateau, *Sophora vicifolia*, or a form of that species, was abundant, in full bloom, and exceedingly attractive. The flowers are of fair size, of a pale shade of blue and white, and produced in amazing abundance. In the same region, beyond Tsin-tin, on the dry rocks and open cliffs is found *Androsace Bulleyana*, and I have seldom seen a finer or

is too robust for an ally of *P. Cockburniana*, and, besides, I found the flowers of many specimens flushed in bud the Indian red, typical of *P. Bulleyana*. It flowered last year at Edinburgh and Colchester, from seed collected by me in 1914.

On the Bei-ma-Shan and around Atuntze several species of *Primula* were found. A glorious new form of the *nivalis* section, yet unnamed, first discovered in 1914 on the Chung-tung plateau, was abundant in every meadow. The colour range is great, from deepest violet through every shade of lavender to pale rose. Never, in any form or species of this large and widely-distributed group have I seen such robust plants; some of the clumps bore as many as 35 scapes, each with an umbel of 50-70 blooms.

TREES AND SHRUBS.

GINKGO BILOBA.

I ENCLOSE a photograph (see fig. 62) of *Ginkgo biloba* (Maidenhair Tree) at Blaise Castle, near Bristol, sent to me by Mr. F. D. Harford, brother of Major J. C. Harford, the owner of the place. This specimen, if not quite the largest, is certainly one of the best shaped and most symmetrical in England. When mentioning this tree in *The Trees of Great Britain and Ireland*, Vol. I., p. 61, I gave its height as 72 feet on Miss Harford's authority, but when I afterwards, in 1905, measured it myself, I found it to be 68 feet by 9 feet 3 inches. Now, measured by a theodolite, Mr. Harford tells me that it is 70 feet by 10 feet

5 inches, so it has increased 2 feet in height and one in girth in twelve years.

Other large trees of this species, which is often called *Salsolima adiantifolia*, that I have seen, are as follows.—One at Frozmore, figured on Plate 22 of our work, which in 1904 was 74 feet by 9 feet 5 inches; a tree at Sherborne Castle, Dorsetshire, said to have been 70 feet by 7 feet 7 inches in 1884, but which I found to be 75 feet by 8 feet 10 inches in 1907. At Whitfield Court, Herefordshire, I found in 1906 a very fine tree, then 62 feet by 9 feet 6 inches, which had burrs growing on the trunk, as appears to be usual in China and Japan. A tree recorded in *Flora and Silva*, Vol. II., p. 357, at Melbury, Dorsetshire, was stated to be over 80 feet high, but I could not find this tree when I visited Melbury, and should be glad to know if it now exists, and, if so, what are its correct dimensions. There is also a fine tree at Colham, which in 1905 was 68 feet by 9 feet 4 inches. If anyone knows of others as large as or larger than these, it would be interesting to have them recorded, as the tree is evidently a slow grower when it approaches maturity.

H. J. Elvers, Colshourne

CAMELLIA SASANQUA.

This charming shrub was recently found in bloom here, and it made a welcome addition to late shrubs. Given a place on a wall, it will grow freely. I am told that *C. sasanqua* is common in China and Japan, and that the wild forms are always white. The flowers are semi-double to single, and some are wholly bluish or red, while others are splashed with white. The tree is of a straggling nature, which makes it all the more beautiful when in flower, and quite handsome as a wall plant. It is something like *C. Dondelarii* in colour and markings, but is not so large as that species. W. T. Coul, *Albion's Wood, Godalming.*

BULB GARDEN.

THREE CHEAP AND PRETTY AUTUMN CROCUSES.

IN the first rank we may place the lovely Blue Crocus, *C. speciosus*, which is large, easily grown, and very beautiful. It has hardly a rival in the possession of all these qualities, and can be bought for less than a penny a corm in quantity. It has fine light blue flowers handsomely veined on the outside with deeper markings. It is a good flower for the border or rock garden, and also for planting in grass. It flowers about the end of September. The variety *C. s. Antichorum* is lighter in colour, and is a gem indeed. *C. speciosus* albifl. has white flowers and is more expensive.

THE ZONED CROCUS.

Of dainty charm, *C. zonatus*, see fig. 65) up- preads to us more by its refinement than by its size. It has flowers of a pleasing shade of rose lilac, and its charms are heightened by the orange scarlet zone which decks the base of the interior of the flower. This Crocus is quite easily grown, and is one of the prettiest of the numerous charming flowers of its class.

THE IRIS FLOWERED CROCUS.

Botanical names are not always appropriate, but that of Crocus *iridiflorus* is most apt, as the blooms bear a distinct resemblance to those of an Iris. So much is this the case that a noted botanist recently proposed to found a separate genus called *Crociris* and to separate the subject of this note from the other Crocuses, making it the type of this new genus. The resemblance is due to the outer segments of the flowers being longer than the anterior ones and being also of a different shade. The flowers are of a beautiful rose-lavender, and the charm of the blooms is heightened by the exquisite colouring of the reproductive organs. A little higher in price than the other Crocuses here discussed, it is yet a species of quite reasonable cost and of the highest type of beauty.

These Crocuses should be planted at a depth of 2 inches in light soil, and of 1 inch in heavier ground. They should have a sunny sheltered position. S. Wood.

NERINE APPENDICULATA.

THE Botanic Garden at Montpellier received in 1907 a small number of bulbs of *Nerine appendiculata* from M. Dieterlin, who collected them on the banks of the River Calodon in the Lérise province of Basutoland. The Curator of the Botanic Garden, my friend M. Daxeu, kindly sent me a few bulbs. They have been cultivated here in the open ground, and have lived through several severe winters without injury. They have flowered regularly each year in the second fortnight of September, at the same time as *N. samiensis*. The flowers, of a pretty rose-

plant them out in the open ground, but against a wall which will protect them from north winds. During the winter of 1916-17, which was long and severe, I did not lose a single bulb of *N. appendiculata*; while *N. samiensis* and Hadron this pratensis in the same border had 20 per cent of the bulbs frozen.

I may mention that according to M. Dieterlin the local Basutoland name for *N. appendiculata* is "Beteu." P. Davis, *Babuan les Baits, France.*

FRUIT REGISTER.

BULLACE THE LANGLEY.

This is undoubtedly a very fine addition to our late fruits. I was much impressed with it when

FIG. 65. CROCUS ZONATUS.

pink, are comparatively large, and are raised well above the foliage, which is very narrow for a *Nerine*. Numerous bulbs are produced, which can be used for propagation. I do not understand why the culture of this *Nerine* is considered difficult; I cultivate it in a compost made of half ordinary garden soil, a quarter leaf mould, and a quarter sand. My garden soil is fairly rich in lime, and it is possible the species is a calcicole one.

The *India Keuken-De* gives no locality for the plant. I know of one other, besides the banks of the Calodon River. Mr. Medley Wood sent home some plants which he collected near Boston, Natal, where it flourishes at an altitude of 5,400 feet.

The young bulbs planted in pots grow very slowly; it is probably the best plan to leave them in the pots only for one year, and then to

it first came under my notice, and at once added it to our collection. It is absolutely distinct from anything I am acquainted with; the tree is a strong grower, and very prolific in its young state. The fruits are ready for use after the large majority of stone fruits are past. They are of large size, purple in colour, and attractive in appearance. The flavour is excellent. They are also of the very best for preserving, either for making jam or bottling. B. Beckett

PEACH LADY PALMERSTON.

Of late Peaches none is equal to the variety Lady Palmerston; lasting until the third week in October it is a Peon where late fruit at a minimum cost is desired. Rivers states it was raised from a stone of the Pineapple Nectarine, which accounts for its distinct flavour. In growth and freedom of crop this Peach is all that could be desired. B. M.

* First described in *Gard. Chron.*, Sept. 22, 1884, p. 336.

ORCHID NOTES AND CLEANINGS.

ORCHIDS AT BRYNDIR, ROEHAMPTON.

At Bryndir, Dr. Miguel Lacroze's beautiful residence at Roehampton, on the outskirts of London, Roses and Orchids are especial favourites. The Orchids are grown in a well-appointed block of houses, erected and fitted from Dr. Lacroze's own plans by local tradesmen, and the glass houses are approached by arched walks of Roses running through beds and borders of Roses.

The Orchid growers having left in succession to take up military duties, Dr. Lacroze himself, with the assistance of a skilled lady grower (Miss Robertson), manages the plants. The block of Orchid houses consists of five short ranges, connected at the ends by a corridor-house, in which the older plants of the collection are grown, together with batches of *Odontoglossum grande*, *Lycastes*, and *Cymbidiums*, all the plants being in a thriving condition. Varieties of *Laelia anceps* and other dwarf Mexican *Laelias* are suspended overhead. The plants in the other houses are chiefly hybrid *Cattleyas*, *Laelio-Cattleyas*, *Brasso-Cattleyas*, and *Sophronitis* crosses.

In one division is a fine lot of hybrids approaching flowering size. A second house contains, among other plants, excellent specimens of *Cattleya Folia* and *C. Vulcan*. In a third house are well-grown specimens of a richly-coloured *C. Folia*; *C. Foliata* and *C. Dowiana* of a clear yellow colour, with gold veining in the deep ruby purple lip. This last species thrives remarkably at Bryndir, and small plants flower well. *Brasso-Cattleya Digbyana* Warneri and some *Laelio-Cattleya* were also in bloom in this house.

A fourth house contains a fine set of *Brassavola Digbyana* crosses. Plants in flower included *Cattleya Enid Bryndir* variety, a magnificent flower of great size, with pure white sepals and petals, the broad lip having a violet purple front and clear yellow disc; *C. Pretoria* (*Dowiana aurea* × *Petersii*) with a dark, ruby-red lip having an orange glow from the centre; a plant of the new *Brasso-Cattleya Sifrana*, and some excellent specimens of *B. C. Hene*. Novelties included *Brasso-Cattleya Jolny* (*B. Digbyana* × *C. Comet*), of good, large *Cattleya* shape, but with fringed lip, white tinged and veined with rose, the lip having a yellow centre and gold veining from the base; *Brasso-Cattleya Salta* (*B. C. Digbyana*-*Mossiae* × *C. Dowiana aurea*), of a deep rose-mauve colour; and *Brasso-Laelio-Cattleya Tucman* (*B. L. C. Cooksonii* × *C. Rhoda*), of a copper yellow tint with rose front to the lip, which shows in the fringing and the reddish-orange base the *Brasso-Cattleya* Mrs. M. Gratrix in *B. L. C. Cooksonii*. Other good Orchids noted in flower or bud were *Sophro-Laelio-Cattleya Marthon* and *Laelio-Cattleya Medina*.

A house is devoted entirely to seed-raising, and here the seed from many capsules approaching maturity in the various houses will be tested. One stage is well filled with small seedlings, most of them raised from carefully planned crosses made by Dr. Miguel Lacroze himself. His work is methodical and precise, and when the results are in time worked out, they may throw much valuable light on the question of colour production and other characters. Records are kept of the parents, their pedigree, which parent bore the seed, when the seed matured, when it was sown, when germinated, and when flowered. When possible the cross is made both ways, and the seed bearer recorded, and thus the changes and diversity in colour between the reverse crosses will be noted, and help to solve many problems at present but partly understood. When the plants flower portraits of the blooms are painted, and again when they are mature.

The other side of the seedling-house has cases for small plants, and for "breaking" the back pseudo-bulbs removed from large specimens. These are not potted until the first roots de-

velop after growth commences. A span rooted, cool range stands apart from the main block, and is filled with a vigorous collection of *Odontoglossums*, *Odontodas*, and other Orchids, some of which have won awards at the Royal Horticultural Society's meetings. *Masdevallias* and *Sophronitis grandiflora* are suspended from the roof-rattens, the latter being specially selected varieties for crossing. Already there are well-matured seed capsules, the result of promising crosses, which may be expected to give hybrids of great merit. *B.*

ON INCREASED FOOD PRODUCTION.

YIELD OF POTATOS IMMUNE TO WART DISEASE.

The Royal Horticultural Society has conducted a cropping trial of varieties of Potatos immune to wart or black scab disease in the Wisley gardens. The varieties were those which the Board of Agriculture has found to resist the disease, even when grown in infected soil.

Forty tubers of each variety were planted in April, and the crops were lifted as they became ready. The yield from forty tubers is shown in brackets after each variety:—

EARLY VARIETIES.—A 1 (92 lb. 10 oz.), Resistant Snowdrop (118 lb. 2 oz.), Edzell Blue (155 lb. 4 oz.).

SECOND EARLY VARIETIES.—Conquest (125 lb. 15 oz.), King George (158 lb. 1 oz.), Great Scot (145 lb.), Southampton Wonder (141 lb. 2 oz.), Sir Douglas Haig (156 lb. 15 oz.), The Duchess (144 lb. 14 oz.), The Ally (147 lb. 15 oz.).

LATE OR MAINCROP VARIETIES.—Abundance (146 lb. 14 oz.), Culldees Castle (114 lb. 9 oz.), King Albert (147 lb. 6 oz.), The Provost (92 lb. 1 oz.), Crofter (155 lb. 12 oz.), Jeannie Deans (114 lb.), Favourite (138 lb. 15 oz.), Twentieth Century (129 lb. 2 oz.), The Admiral (81 lb. 9 oz.), Burnhouse Beauty (132 lb. 13 oz.), The Lord (97 lb. 11 oz.), Langworthy (124 lb.), What's Wanted (123 lb. 4 oz.), Golden Wonder (145 lb. 12 oz.), Bob Roy (139 lb. 3 oz.), The Lechar (174 lb. 4 oz.), Heather Bountiful (78 lb. 10 oz.), Leinster Wonder (118 lb. 2 oz.), Kerr's Pink (142 lb. 5 oz.), Irish Queen (121 lb. 9 oz.), Shamrock (125 lb. 14 oz.), White City (95 lb. 5 oz.), St. Malo Kidney (155 lb. 8 oz.), Dominion (146 lb. 7 oz.), Tinswald Perfection (110 lb. 8 oz.).

POTATOS AT NEWARK.

An exhibition of Potatos and other produce grown by local allotment holders was held at Newark recently, in the Town Hall. A cup, presented by Mr. J. Mason for the best crop of Potatos was won by a police-constable, Mr. F. Smith. It was stated that one grower had obtained half a ton of Potatos from three and a half stones of seed tubers, and that others had been almost as successful. Mr. Mason has offered another cup for a similar scheme next year.

POTATO YIELDS.

SOME astonishing yields of single roots of Potatos have been experienced this year, but no single plant in the district of Croxson has approached a root just lifted by Mr. C. Wellstead, gardener to T. Rigby, Esq., Chesterfield, Warham Road, Croxdon.

At the end of March Mr. Wellstead planted one two-ounce tuber of Factor Potato at the end of a Rose bed. Five growths appeared above the ground, and to keep the growths of a slightly appearance he tied them to a stake. Soon he found the stake not long enough, and placed another in position, continuing to tie the haulm as it grew. On September 10 the haulm was measured, and found to be 8 feet high, and at its widest part about 5 feet through. Scraping a little soil from the roots, Mr. Wellstead removed seventeen Potatos of good quality, weighing 6 lb. 1 oz.; the soil was afterwards replaced, and on October 15 he dug the root up, the remaining tubers weighing 4 lb. 10 oz., altogether 10 lb. 11 oz. At the first lifting the tubers were

sound and healthy, and these remain so, but in the latter stage of growth a good deal of disease was apparent, both on the haulm and in the tubers.

One can imagine the soil to be in splendid condition, and such a prodigious yield as this makes one think that the fact of growing the haulm in an upright manner has accounted for the bountiful crop. *Harry Boshier*.

ONIONS VERSUS FLOWERS.

A RECENT visit to the well-managed gardens at Abington, Morpeth, proved not only the keen interest taken by F. Straker, Esq., in the production of vegetable food-stuffs, but also his generosity in contributing large supplies to the Navy and Army. A notable feature was a superb crop of spring-sown Onions, in beds that previous to the war were all aglow with flowers. Very striking was the uniformity, in shape as well as size, of the bulbs, and their aggregate weight for the small amount of space occupied, which was clear evidence of the skill and attention Mr. Cawke, the gardener, had bestowed on them. Many of the bulbs turned the scale at 50 ounces, with a measurement of 16 inches in circumference. The variety grown is *Ailsa Craig*. *J. P. Leadbetter*.

PEA MICHAELMAS.

I HAVE grown the above-mentioned late Pea for two seasons, and it has proved more prolific than the good Pea Autocrat, and a taller grower. The two varieties were sown on June 6, two long rows of each, in well-manured trenches 2 feet wide and 10 feet apart, and the space between the rows planted with Savoys. The trenches were filled nearly to the surface, and the soil made firm and raked over. Two drills were drawn down each trench 10 inches apart, and the seed sown singly about 2 inches apart, and covered in. When the plants were about 2 feet high they were well watered, as the weather was just then dry and sunny, and they were mulched with well-rotted manure. They grew straight away without a check after this, and the tops were pinched out about the end of September. We have been picking every day since. Michaelmas grew about 6 feet high, and Autocrat 5, but much the better crop was carried by the former variety. Late Peas should be given a good, rich soil and plenty of manure, as they have to make their growth in what is often the hottest period of the summer. Another item to bear in mind is to sow timely. *R. W. Thatcher, Carlton Park, Market Harborough*.

BRASSICAS MATURING WHERE SOWN.

I HAVE never practised sowing any of the Brassica tribe where they were to "head" or mature, but it has been proved to me this year that it can be done with success. Owing chiefly to shortage of labour, the surplus stocks of Cabbage, Cauliflower, Broccoli, and Brussels Sprouts were left in the seed rows when they should have been transplanted, and as the season advanced they looked so promising that I decided to leave them where they were. The "heating up" of the Broccoli and Brussels Sprouts still continues; Cabbages have been really good, though smaller than those transplanted; Cauliflowers were likewise smaller. These plants have been left entirely alone; they had no final thinning, no hoeing, nor any assistance whatever since sowing, and the results certainly suggest that Brassicas might be sown and grown without transplanting. *C. T., Amphill Park Gardens*.

ALLOTMENTS.

THREE HUNDRED allotment-holders, representing 30,000 in London and Southern Counties, met at Essex Hall on the 20th inst., under the auspices of the Vacant Land Cultivation Society, and voted in favour of formulating a charter for the purpose of establishing a federation, which will link up with other federations throughout the country, and ultimately merge into a national union of allotment-holders.

The Week's Work.

THE KITCHEN GARDEN

By J. DUNN, Foreman Royal Gardens, Windsor

CAULIFLOWERS.—Cauliflower plants raised from seed sown in the middle of September are ready for transplanting into 4 inch pots. Let there be no delay in this work, for if the seedlings are allowed to become drawn before they are potted they will not give the best results. The soil may consist of three parts loam from an old Melon bed, and one part decayed manure, with a sprinkling of rough sand or sifted lime rubble to render the compost porous. Pot firmly. Place the pots on a bed of ashes in a cool brick pit, which may be kept closed until fresh growth commences, when air should be given in gradually increasing amounts until finally the lights are removed entirely on sunny days. The plants should be hardy and sturdy, but not started from want of water at the roots. Seedlings which are not required for potting should be transplanted into frames, where protection can be given from severe frosts.

CUCUMBERS.—Plants in bearing should be given weak liquid manure from the farmyard on frequent occasions. Top dress the roots lightly with a mixture of bon and leaf-mould in equal parts, and do all that is possible to keep the plants clean and healthy. Warm the soil used for top dressing before applying it to the bed and use only a small quantity at one time. Remove all rough foliage and thin the shoots as usual to prevent over-crowding of the growth. Stop the shoots at the first or second joint beyond the fruit, and remove all fruits beyond what are required to maintain the supply. Successional plants are making good progress, and require regular watering. These plants are intended to furnish fruits throughout January and February, and should not be allowed to get below a night temperature of 70° is suitable on mild weather, but a few degrees lower will suffice in cold weather, as much fire-heat must not be used. Syringe the foliage lightly during sunny weather and damp the walls and floor of the house.

ONIONS.—Examine Onions in the store and remove all loose skins and every bulb which shows the least sign of decay. Place the Onions in single layers where space permits. The inferior bulbs should be selected as far as possible for immediate use. Ventilate the loft freely, and turn the bulbs carefully at least several times during the autumn. The seedling autumn-sown Onions should be kept quite free from weeds. Hoe the growth carefully between the rows and pull up all weeds which the hoe does not remove. We are using good, sound bulbs of Lord Keeper, raised from seeds sown in August, 1916 and which to all appearance will keep throughout the winter. This is a good variety for spring or autumn sowing.

PARSLEY.—This crop has become overgrown in consequence of the recent showery weather, and the plants require to be cut back in order to encourage the growth of stocky leaves which will be able to withstand the winter. Some part of the crop may be left in its present state for immediate use, but that which is intended to furnish a supply from January onwards should have most of the large leaves removed as soon as possible. Overgrown foliage should also be removed from Parsley plants in pots.

FRUITS UNDER GLASS.

By JAS. HENSON, Head Gardener at Ginnery House, Aston, W.

VINEYERIE.—The showery weather has not been favourable to the keeping of late Grapes. Watch constantly for the first symptoms of decay in the bunches, for if affected berries are not removed at once, the decay will spread quickly, and the whole bunch be disfigured. Bunches that continue to show decayed berries should be used forthwith. In examining the Grapes from day to day it is a good plan to tie a piece of raffia

near bunches that need close attention. Large bunches, such as those selected for exhibition, are difficult to keep when any berries tend towards decay. Smaller bunches are much better for keeping, as they are dried in damp weather, when there may be an excess of moisture in the viney. Probably, too, the roof may be leaky, necessitating somewhat more firing to keep the atmosphere dry and congenial for the Grapes' keeping. But an excess of fire heat will result in the berries shrivelling; therefore endeavour to obtain a middle course between too much damp and too much dry heat. Close the house at night and watch the weather for ventilation during the day; never allow the temperature to rise more than a few degrees without venting. When the Grapes are fully ripe, as they should be now, a night temperature for the present of 50° is ample, allowing for a drop of 5° during frosty weather. Do not, on any consideration, allow the Grapes to be valued for late dessert supplies allow any pot plants in the viney. There is a tendency at this season to crowd far too many plants into fruit houses; it is not by any means a good practice to do this in the very smallest degree. If plants must be put into viney, where that has up to now been hanging, then it will be far better to cut the Grapes and place them in bottles in a dry room, but not where Apples and Peas are stored. If only a partial crop is still hanging, cut the bunches and bottle them at once. My remarks, however, have applied particularly to a full crop in the latest house or houses, as in the case of a separate house of Muscats. As soon as the Grapes have been cut in any house, reduce the amount of foliage. In doing the best to move all the green wood and the laterals. The leaves at the ends will after old-time and as soon as they have fallen pruning may be commenced, say, during November. Watch the inside borders and do not allow them to become at all dry, even when the leaves have fallen.

PLANTS UNDER GLASS.

By F. G. WESTON, Gardener to Lady Northcote, Eastwell Park, Kent.

WATERING PLANTS IN AUTUMN AND WINTER.—As the days become shorter the watering of plants will proceed more slowly. Many plants which require considerable supplies of water during the growing season are very pressing to their demand on resting stage. *Calceolias*, *Gloxinias*, *Adiantums* and *Begonias* are examples. It is a common mistake to dry these plants off too quickly, that is, while the foliage is quite fresh. They should be given a gradually decreasing supply of water till the foliage has completely withered, after which should be withheld altogether. The ordinary greenhouse watering should be done in the morning, as soon as the temperature rises. Allow a little time for the plants to drain, and then top the floors thoroughly, so that the atmosphere will be fairly dry before nightfall. When water is required give sufficient to thoroughly moisten the whole of the soil in the pot, and then leave it to get fairly dry again. Overly syringing should be greatly reduced at this season. On fine days syringe and close the house early in order to conserve the sun heat. On dull days very little syringing will be required, except in the hottest houses, and in the ordinary way every effort should be made to reduce the fire heat, only using enough to raise the temperature sufficiently high to keep the plants healthy.

MARGUERITES.—Plants of the *Marguerite* (*Chrysanthemum frutescens*) that have been grown out of doors during the summer with a view to flowering indoors in winter should now be arranged in the greenhouse. They will be found especially adapted for grouping with *Salvia splendens*, *S. azurea*, and other brightly coloured flowers. Plants that have filled their pots with roots require ample supplies of water when standing on a dry stage, and if neglected in this respect will soon show evidence of it, in the loss of freshness in the foliage, which will turn yellow and sickly in appearance. Use a pinch of concentrated fertiliser occasionally. Keep a sharp watch for the leaf-mining maggot,

which increases rapidly under glass. Infested leaves should be picked off and burned. Cuttings strike root readily at almost any season; it is a good plan to have a few young plants in reserve, as young, healthy specimens are of much greater decorative value than less vigorous stock.

THE HARDY FRUIT GARDEN.

By W. A. COOK, Gardener to the Hon. ARTHUR J. DAVEY, Abbots Wood, Godalming, Surrey.

THE USE OF LIME IN SOILS.—It is generally well known that the presence of lime in soils is very necessary, and more especially for stone-fruits, such as Cherries, Plums, Peaches, Nectarines and Damsons. The amount of lime is subject to loss, owing to carbonic acid, which is as more or less present in rain-water, and also that which is constantly being formed in the soil itself, acting as a solvent to the lime. The loss is also increased by the use of manures containing sulphate of ammonia and low-grade acid superphosphates, but is diminished by the use of nitrate of soda, basic slag, farmyard and stable manure, and ordinary garden refuse from the fire heap. A certain amount of lime in some form should be used when planting stone-fruits, and it may be used in the form of crude lime, leaving it to shake on the ground, and so find its way downwards. Gypsum may be used if lime is not easily obtained, but I should advise looking this up to the soil previous to planting. Many soils containing little carbonate of lime may remain healthy under ordinary cultivation, provided that acid manures or coal ashes are not used.

ROOT-PRUNING.—Proceed with the root pruning of fruit trees as advised on p. 149. The soil, owing to recent rains, is now in splendid condition for working, and still retains much warmth; the sooner this work is accomplished the better will be the result.

PLANTING APPLE TREES.—Orders for the trees should be sent as soon as possible. Early planting is in every way desirable. Obtain a selection of both culinary and dessert varieties that will give fruits over a long season.

THE FLOWER GARDEN.

By W. J. GEISE, Gardener to Mrs. DEANSTON, Keele Hall, Staffs. Leam.

THE ROCK GARDEN.—Bulbs for the rockery need to be planted directly they are available, as they quickly deteriorate if kept out of the soil for any length of time. I refer especially to small bulbs, such as *Crocus*, *Scilla*, *Thunbergia*, *Galanthus*, *Smilacina*, *Erythronium*, *Aconitum*, and *Fritillaria*. Others that should be included are *Husis* in variety, *Narcissus*, *Anemone* double, *Asperula*, *Muscari*, and *Tulipa Custania*. Take advantage of fine weather to complete the planting of Alpines before cold, wet weather sets in. Several species are suitable for massing, such as *Arabis*, *Aubrieta*, *Saxifraga*, *Campanula*, *Veronica*, *Artemisa*, *Dianthus*, and *Cerastium*. The last is difficult to eradicate once it gets thoroughly established. In top-dressing established plants, remove a little of the surface soil and work in the new compost firmly between the plants. Certain Alpines need a little peat mixed with the soil when top-dressing, but farmyard manure should not be used. A small quantity of fertiliser may be incorporated with the soil when dealing with old plants. Where plants have died or become exhausted, the old soil should be removed and replaced with fresh compost. Vacant places may be filled with *Polyanthuses*, *Myosotis*, *Daisies*, or a selection of suitable shrubs.

PLANTS IN TUBS.—The housing of specimen plants in tubs or vases should no longer be delayed. Apart from the danger of frost, there can be no advantage in leaving untidy plants in conspicuous positions. If cool houses are not available for a few weeks, certain plants, such as *Myrtles*, *Hydrangea hortensis*, *Verbenas*, and *Camellias*, will take no harm if they are placed in a sheltered position, where they can be covered withiffany when there are signs of frost. *Pelargoniums*, *Fuchsias*, *Acapanthus*, *Heliotropes*, and similar tender plants should be removed at once to houses, where a little fire-heat can be used during frosty weather.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

APPOINTMENTS FOR NOVEMBER.

TUESDAY, NOVEMBER 6—

Roy. Hort. Soc.'s Com. meet. and National Chrys. Soc. combined show.

WEDNESDAY, NOVEMBER 7—

R.G.A. Executive Com. meet.

TUESDAY, NOVEMBER 20—

Roy. Hort. Soc.'s Com. meet.

THURSDAY, NOVEMBER 22—

Roy. Botanic Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 47.2.

ACTUAL TEMPERATURE.—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Thursday, October 25, 10 a.m. Bar, 29.1; temp., 49.5. Weather Bright sunshine.

SALES FOR THE ENSUING WEEK.

MONDAY—

Bulls at 67 and 68, Chesepide, at 1 o'clock, by Protheroe & Morris.

WEDNESDAY—

Trade Sale of Bulls at Protheroe & Morris's rooms at 1 p.m.

FRIDAY—

Bulls at Protheroe & Morris's rooms at 1 o'clock.

As readers of the *Gardeners' Chronicle* are well aware, Mr. Spencer Pickering has for many years devoted himself to the study of the effects of grass on the growth of fruit the other trees. He investigations carried out on the Woburn Experimental Fruit Farms led him to the conclusions that a covering of grass exercises a harmful effect on the growth of trees and that this effect is due to the formation by the roots of the grass of a substance which acts as a poison on the roots of the trees. The former conclusion has been very generally accepted, and it is now recognised by fruit-growers that at all events young trees do better when grown in cultivated ground than when grass is allowed to cover the soil in which they are planted. A striking illustration of this fact is provided by the young plantations of Apples in the Royal Horticultural Society's gardens at Wisley. There, similar trees planted at the same time may be seen, some in cultivated land and some in grass, and the difference between them is so striking as to convince the most sceptical. The latter of Mr. Pickering's conclusions—that the check to growth which occurs when trees are planted in grass is due to a poison emanating from the grass—has not met with such general acceptance.

The series of experiments recently published* by Mr. Pickering will, we think,

prove very difficult of explanation on any grounds other than the "toxic" hypothesis.

The crucial experiment, which is described and illustrated in the paper already referred to, was carried out in the following way:—In each of three pots a Mustard plant is grown. One pot is uncovered, the other two have each resting upon them a tray containing 5 inches of earth, in which the Mustard is sown. In one case the base of the tray is perforated by holes through which water added to the tray may pass to the earth in the pot. In the other the holes are blocked, and hence no water from the tray can pass into the pot below. The result is extraordinary. Whereas the growth in the uncovered pot and in that of the pot covered by an unperforated tray is vigorous and normal, the growth of the Mustard in the pot covered with the perforated tray is puny in the extreme—not more than one-hundredth of that in the other pots.

Nor is this remarkable checking of growth by any means confined to Mustard. Among other plants which have proved to be susceptible are Apples, Pears, Plums, Cherries, six kinds of forest trees, Tobacco, Tomato, Barley, Clover, and two varieties of grasses; and among plants which have been proved to exercise this baleful influence are Apple seedlings, Mustard, Tobacco, Tomato, two varieties of Clover and sixteen varieties of grasses. The adverse influence exercised by one plant on another varies in different cases: the reduction of growth brought about in this way may be so much as 97 per cent. or so little as 5 per cent., and in the field the effect ranges in different cases from a slightly detrimental to one so completely toxic as to bring about the death of the tree. It is curious to note that so far no surface crop has been found which is more toxic than another.

Mr. Pickering points out also that the effect of grass on fruit trees varies considerably in different soils, and yet when these soils are made the subject of experiment all are found to behave alike and to convey the poison equally well.

The toxic substance, which may be of the nature of an excretion, or may be produced by the decomposition of dead parts of the growing root—for example, root hairs which have only a life of a few days, and as they die are replaced continually by another equally evanescent crop of root-hairs. In any case, the toxin is very like that which is produced when soil is heated to a moderate temperature. In either case the poison is easily oxidised, and when oxidised acts apparently as a nutrient substance. Thus if the leachings from the Mustard tray in the experiment already quoted are kept exposed to the air for twenty-four hours and are then added to any of the pot plants, their poisonous effects are found to have disappeared, and they may even act beneficially. Mr. Pickering points out that the harmful effect of cover crop and permanent crop is reciprocal. The Apple which suffers from the grass may and does

retaliate, and he suggests that to this is in part to be attributed the poor growth of grass under trees. It may be so but there are not a few difficulties which prevent us from accepting this view without more evidence.

A subject of importance which may receive some illumination from these experiments is that of spacing of crops. If a crop such as the Potato is planted at certain orthodox distances from plant to plant the individual yields of the plants may be so much as double those obtained by closer planting, and yet the closer planting may actually yield a bigger crop.

What looks like an example of a toxic effect, though usually ascribed to the drying and impoverishment of the soil by the cover crop, is the frequent failure of Privet and Euonymus hedges when grass is allowed to grow close up to the stems. In one case of this kind which came under our notice a hedge of Euonymus languished for six years and made no growth whatsoever until the grass was removed.

Mr. Pickering quotes an interesting example of the beneficial effect which may occur after the toxic substance has had time to undergo change. An Apple orchard, a quarter of an acre in extent and containing fifteen trees twenty years old, was planted with Brussels Sprouts. Under the trees the Sprouts suffered to the extent of 48 per cent. of their growth; but in similar patches on which trees had been cut down the previous winter, the Sprouts did better by 12 per cent. than in any other part of the ground.

Although, as already stated, no marked difference appears to exist between the toxic-producing powers of different plants, it seems to be a fact that a plant is more toxic to another plant of its own kind than to one of another species. It follows from this that the toxin produced by a plant may be injurious to the plant itself. If this prove to be the case, we should have an additional, and, perhaps, chief reason why thinning of crops should be undertaken as early as possible, and perhaps, also, why transplanting is often beneficial. In an interesting experiment carried out by Mr. Pickering it was found that if three seedlings (Mustard) were sown in a pot large enough for six plants, and if when they had germinated another three were sown, the last-sown remained to the extent of 60 to 70 per cent. smaller than the first-sown plants. The pot, be it noted, contained ample soil—over 16 lbs. of loam. The experiment certainly illustrates, as Mr. Pickering points out, the desirability of sowing seed of even germination. Possession would seem to be nineteenth of the law of plant life.

The paper deserves to be read in its entirety. It sheds new light on old problems, and, what is even more important, sets the reader thinking. The subjects discussed in it are of such importance that they deserve wide discussion, and we shall be pleased to offer facilities in these pages for those who are able to contribute to that discussion.

* The Effect of One Plant on Another. Spencer Pickering, F.R.S., *Annals of Botany*, XXXI, No. 12, April, 1917.

NATIONAL CHRYSANTHEMUM SOCIETY.—The National Chrysanthemum Society will hold an exhibition in connection with the Royal Horticultural Society's meeting on November 6, in the Drill Hall, Buckingham Gate, Westminster. The schedule includes twenty-nine classes, divided into three sections, and besides money prizes, several cups and trophies are offered in important classes. Mr. A. A. WITTY having resigned the office of secretary, after a service of 11½ years, the Committee has appointed Mr. CHAS. H. CURTIS as his successor. The Council has decided to present the Gold Medal of the Society to the late secretary, together with an illuminated address, as a mark of its appreciation of his services.

NATIONAL SEED TESTING.—Mr. R. G. STALLETON, M.A., Advisory Botanist to the University College of Wales, Aberystwyth, has been appointed Director of the National Seed Testing Station, established by the Food Production Department at 72, Victoria Street. The station will open early in November.

AN EMPLOYER'S DUTY.—Regulations require employers of labour to make a return of all male employees from 16 years of age on a form, D.R. 17, obtainable at any post office, to the Recruiting Officer of the district in which the man works. A duplicate form should be kept by the employer on the premises, and both should be revised monthly if the occasion arises. Failure to comply with this regulation entails heavy penalties under Defence of Britain Regulation 41a.

WOMEN'S INSTITUTE.—The Women's Institute movement in England has now been taken over by the Women's Branch of the Food Production Department.

SHORTAGE OF SEEDS IN AMERICA.—The *Boston Transcript* for September 19 last urges the utmost importance of conserving seeds. The unusual severity of last winter killed a number of seeds in districts all over the Northern States of America, and the reserve stock usually kept in the country has been exhausted. In normal conditions large quantities of seeds are imported from France, Germany, Holland and England. The most acute shortage is in Beet, Carrot, Turnip and Parsnip seed. Spinach seed, which used to be 25 cents a pound, is now being sold at \$1.25. It is also probable that there will be a shortage of Bean seeds, owing to the frosts having destroyed a large part of the crop in Michigan, one of the largest Bean-producing States. Most of the Cauliflower seed is imported from Denmark, and even in ordinary seasons costs up to \$20 a lb. Now, the Cauliflower industry may be seriously interfered with. Onions, the seed of which was formerly imported in large quantities from France, are now being grown on a large scale in California. The hills are kept over the winter and transplanted in the spring, when they flower and produce seeds very rapidly. The great Cucumber-growing State is Michigan; one concern in this State controls a thousand acres given over to this crop. With the European supply diminishing each year that the war continues, the United States will find itself under the necessity of vastly increasing its acreage, for it is confronted with the problem of feeding the whole world.

SCHOOL GARDENING AT SHERBORNE.—Mr. CHARLES H. BYRON, the head master of the Sherborne (Dorset) County School, sends us a carefully compiled table of the results of Potato growing trials carried out by the boys of his school. The varieties employed were Arran Chief, Dalhousie, and Up-to-date, and the Potatoes were planted and treated in various ways, careful notes being taken of the results. Thus some of the boys planted whole tubers with all the "eyes" left in, some cut out all "eyes" but two, and others cut the tubers in

small pieces. The respective results of different methods of manuring were also observed and noted for future use.

WAR ITEM.—We regret to announce the death in action of Captain DUDLEY WHELFER WALLACE, M.C., West Yorks Regiment, only son of Colonel R. W. WALLACE, surveyor-general, Golders Green. The gallant young officer fell on October 9, while leading his company into action under heavy shell fire. Captain WALLACE was gazetted in July, 1915, to the Yorkshire Territorials. He would have served with one of the Essex battalions, but was refused on account of defective eyesight. Nevertheless, in spite of this handicap, his fine qualities found him rapid promotion, until at the time of his death, at the age of 29, he was holding the comparatively high rank of Captain. He was awarded the Military Cross for a gallant and successful raid carried out under his leadership. On that occasion 89 prisoners were brought in and the rest of the hostile post killed, whilst there was no casualty among the raiders.

ence, with both plants. My best specimen of No. 1, β is now a little tree 10 feet high, while β of both of them are the same age, viz. nine or ten years. So far as No. 2 is concerned, the difference between the two types is that Wilson's lacks the glaucous coloring of the leaves, which are smaller and more turned up at the edges, producing a spoon-like effect. In this case the divergence between the two types is marked, and jumps to the eyes, as our French Allies would say. As regards No. 4, my attention was first called to there being two types by Monsieur Edmond Versin, of St. Jean le Blanc, near Orleans, who specialises in Poplars and Willows. I raised from seed a good many plants of type β introduced by Wilson, and all of them had the distinguishing and attractive features that the underside of the leaves is of a delicate pale-rosyish pink, and that the young wood is red-dish. In type α , which I obtained from Versin, these features are absent. Moreover, the leaves are larger and darker, and the general appearance of the two trees is dissimilar. I have no knowledge as to where M. Versin originally

FIG. 2. POTATO TUBERS. (Magnified 10 times.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

MARROW KALE. Can any of your readers tell me how Marrow Kale should be prepared and cooked? I was told to plant it save it till by one whose table taste is beyond question, and who informed me that though grown generally for cattle food, the thick, succulent stems make an excellent table vegetable. The plants have done wonderfully well, and have produced stems of great thickness, but my cook is doubtful how to prepare them for the table.

TREE VARIETIES AT ALDENHAM. There are four main plantations here, of which in each case I possess two types quite sufficiently distinct to justify one of them bearing a distinguishing varietal name. They are:

- 1. Ligustrum Quilfordi, type α .
- 2. Ligustrum Quilfordi (Wilson), type β .
- 3. Ligustrum Dalayayannum, type α .
- 4. Ligustrum Dalayayannum (Wilson), type β .
- 5. Elaeagnus umbellatus, type α .
- 6. Elaeagnus umbellatus (Wilson), type β .
- 7. Populus szechuanica (Wilson), type α .
- 8. Populus szechuanica (Versin), type β .

In the case of 1 and 3, Wilson's β form is introduced in Europe by taking the form of a tree with a single stem instead of being a bush, as has always been the case hitherto, in my experi-

ence, with both plants. My best specimen of No. 1, β is now a little tree 10 feet high, while β of both of them are the same age, viz. nine or ten years. So far as No. 2 is concerned, the difference between the two types is that Wilson's lacks the glaucous coloring of the leaves, which are smaller and more turned up at the edges, producing a spoon-like effect. In this case the divergence between the two types is marked, and jumps to the eyes, as our French Allies would say. As regards No. 4, my attention was first called to there being two types by Monsieur Edmond Versin, of St. Jean le Blanc, near Orleans, who specialises in Poplars and Willows. I raised from seed a good many plants of type β introduced by Wilson, and all of them had the distinguishing and attractive features that the underside of the leaves is of a delicate pale-rosyish pink, and that the young wood is red-dish. In type α , which I obtained from Versin, these features are absent. Moreover, the leaves are larger and darker, and the general appearance of the two trees is dissimilar. I have no knowledge as to where M. Versin originally

found type α , whether it also was introduced by Wilson or came from some other quarter. I do not think that there can be any doubt that it is true to name, but in spite of the fact that type α is without the rosy pigment, and looks superficially more like *P. lasiocarpa* than it does like type β , yet the vening on the leaves of both types is identical. I wish that someone who is more of a botanist than I can pretend to be would examine the above-mentioned plants, and, if he should confirm my view that the different types are sufficiently distinct to deserve that one of them should have a varietal name, I would suggest: 1, type β , arborescens; 2, type β , Wilsoni; 3, type β , arborescens; 4, type α , Versini. I hope this letter will provoke someone else, with better knowledge than myself, who has also observed some of these divergences in type, to give you his views and experience. *George Gable, Aldenham House, near Elstree.*

POTATO SPRAYING.—It is to be hoped that should material for a report on the results of spraying Potatoes this year be collected, it will be done without prejudice. It would not be difficult to collect a great deal of evidence in favour of non-spraying. I have seen Potato crops which were ruined by spraying with Burgundy mixture, others that were not affected one way or the other, and others again which without any spraying yielded good crops of Potatoes, in which there was very little evidence of disease. I have seen also areas which had been once or twice sprayed,

and the haulms had in consequence kept growing longer; but there was no difference in the yield, either with respect to quantity, quality, or the number of diseased tubers. Much of what has been called blight (*Phytophthora*) has been black stem rot, a disease which quickly carries off the haulm, but it does not appear to attack them until the tubers are well advanced, and these, when dug, have been quite sound. My view, based on what I have seen this year, is that spraying has not been worth while. The theory that an attack of aphid lays the Potato haulms open to injury by the copper sulphate in the spraying mixture may be taken to mean that in such a case spraying is harmful. The question that is still awaiting a satisfactory answer is, how does the Potato blight get a start in an entirely new Potato district, and how is it that a bad attack, judged by the behaviour of the haulms, does not, as it certainly does not always, extend to the tubers also? One may waste labour and money in appliances which do not do any good. We require to be certain that the treatment will be remedial, before urging that it should become general. W. W.

— It may be hoped that those who can not see any advantage in spraying will give full details of how the work was carried out, because it may be that the conditions were unfavourable, or that spraying was inefficiently performed. It is to be feared that in some cases spraying was done as mere work, which means that only the upper surface of the haulm was sprayed. Some of the failures may be attributed to the lateness of the spraying. I saw many plots sprayed for the first time when the haulm was 2 feet high. Again, much showery weather was experienced, and the nearest novice understands what undue dilution means to liquid mixtures. I grew several acres of Potatoes this season in various localities, and have not much disease in the tubers, which we seldom experience here in the chalky soils, but the crop is short in bulk, attributable to various reasons. I did not spray owing to press of work in other directions, but I regret now I did not do so. I had ample opportunities during the month of September of forming an opinion as to the value of spraying as against non-spraying, having been engaged in judging farms of from 500 acres to 1,400 in size for the award of a challenge cup given by Lord Portsmouth for the best cultivated farm in this county. On several farms Potatoes are largely grown, and they came under inspection. There was no comparison in the appearance of the plots sprayed and unsprayed. The former were a mass of greenery to the extent of 50 acres in one field, while close by the unsprayed had not a green leaf. I do not say the sprayed had no symptom of disease, but they were less affected than the others. A great point in favour of spraying is the incontestable fact that, when properly done, at least twice in the season, the haulm is longer preserved in a growing condition, and naturally the crop is heavier, owing to the period in which the tubers swell. I am aware we shall be told of heavy crops obtained without spraying, and we all know that good culture produces heavy crops, therefore the risk of a few diseased tubers is not of serious consequence. But I have quite made up my mind that spraying must be done next year in the crops over which I have control. *R. Molyneux.*

APPLE REV. W. WILKS.—An Apple weighing 1 lb. 14½ ozs., and measuring 17½ inches in circumference, was grown in the gardens of the Stoke Poges Club. It is of the Rev. W. Wilks variety, and two other Apples from the same tree weighed nearly 3 lbs., 10 ozs., or 5½ lbs. for three Apples. It would be interesting to know the record weight of three Apples from one tree! *S. P. C.* [Five fruits of the variety Belle du Bois, shown by Mr. Haycock at Hereford in 1891, weighed 5 lbs., 5½ ozs. The heaviest individual Apple of which we have record weighed just over 2 lbs. It was exhibited at the Ledbury Show in 1888 by Mr. Robert Smith, and the variety was Warner's King. Other large fruits of which we have entry in our "Record" book are Peasegood's Nonesuch, 1 lb. 12 ozs.; Emperor Alexander, 1 lb., 10 ozs.; and Gloria Mundi, 1 lb. 7 ozs.—Eds.]

WASPS' NEST IN A GOOSEBERRY BUSH.

I send you a photograph (see fig. 65) of a wasps' nest, which has been formed in my garden at Earham on the branch of a Gooseberry bush. The nest is composed mainly of paper, and the paper was obtained from a Strawberry bed, over which pieces of paper had been suspended at intervals in order to keep birds away. With praise-worthy industry the wasps sawed off minute fragments of the paper and carried them to the Gooseberry bush for the formation of the nest. By the time the nest was finished every one of the pieces of paper was riddled with holes. (*Mrs.) E. M. Goddard, 66, East Street, Parnham.*

THE WHITE MARTAGON LILY.—While I am very glad that my offer of seed of this Lily has been accepted by a very large number of persons, I feel compelled to remind some of those who have applied of the sole condition attached to my offer, namely, the enclosure of a stamped directed envelope. I cannot respond to applications on post

FIG. 65. WASPS' NEST IN A GOOSEBERRY BUSH.

cards, not because I grudge penny stamps, but because I simply cannot undertake the labour of writing addresses. I must therefore beg those who do not receive a packet of seeds shortly to understand that it is because they have not complied with my sole condition. Several correspondents have accompanied their request for seeds with the inquiry how they are to be treated. It is impossible for me to reply to such inquiries separately; but I may do so generally by recommending that the seeds be sown in a cold frame and the seedlings pricked out in the open when they are big enough to handle. They may be sown in rows in the open border, where they will germinate freely; but they are apt to be overgrown with weeds in such a situation. *Robert Maxwell, Monmouth.*

EARLY POTATOS.—In view of the food shortage, early Potatoes will doubtless be of great value next season. Amongst several varieties, Duke of York gave by far the best crop this year. I shall be interested to know the experience of other growers. *T.*

SOCIETIES.

ROYAL HORTICULTURAL

OCTOBER 23.—The fortnightly meetings in the Drill Hall continue to attract numerous exhibitors and good attendances. On Tuesday last fruit and vegetables formed the more important features of the exhibition, and the Fruit and Vegetable Committee awarded two Gold Medals to collections of fruit and of vegetables respectively. The fruit was shown by Messrs. G. BUNYARD and Co., LTD., and comprised 150 dishes of Apples, Pears, Medlars and Quinces. The quality was exceptionally good, and Apples were remarkably well coloured. Culinary Apples, such as Mère de Ménage, Bramley's Seedling, Lane's Prince Albert, Hambling's Seedling and Clark's Seedling, a very long-keeping, solid fruit of Bramley's Seedling type, but dull red all over, were especially fine, and there were equally good dishes of dessert varie-

ties. Of the newer sorts we noticed Coronation, Sir John Thorneycroft, an imposing-looking Apple of excellent quality, and Heussen's Golden Reinette, which is red now, but mellows into a golden shade. It is a flattish fruit not unlike Ben's Red, but of superior quality. Pears were shown well, including Winter Windsor, Doyenné du Comice, Beurré Diel and Beurré Clairgeon. The Gold Medal exhibit of vegetables was staged by Messrs. BARR and SOXS, and was representative of most kinds in season. The quality was good, especially Pricetaker Leeks, Rousham Park Horn, Crimson Globe, and Froxfield Onions; Scarlet Intermediate Carrots, Standard Bearer and Solid Pink Celestis, Christmas Drumhead Cabbage, Covent Garden Favourite Beet, and White Marrow Parsnips. Another splendid exhibit of vegetables was shown by ESTACE PALMER, Esq., Drayton House, Sherfield-on-Loddon, Basingstoke (gr. Mr. H. E. Wallis). Carrots in this collection were splendid, including Early Gem, Champion Scarlet Horn, and New Red Intermediate. Other fine produce were Pricetaker

Leeks, Early Market Tomatos, Blood Red and Ailsa Craig Onions, Scorzoneria, Black Beet, and Matchless Brussels Sprouts. Messrs. SUTTON and SONS showed vegetables raised from seed sown in August, Matchless and Satisfaction Lettuces, Spinach Beet, Early Gem and Fairy Carrots; Red Globe and Early Red Milan Turnips, and large rooted Radishes were the finest kinds. An excellent exhibit of fruit was shown by C. A. CAIX, Esp., The Nods, Welwyn, Hertfordshire (gr. Mr. T. Pateman, both Apples and Pears being of the highest exhibition quality). The PUFFLETT SCHOOL showed vegetables, fruits and Nuts grown on the school garden; there were excellent bunches of Royal Muscadine and Espiran Grapes in this useful exhibit.

Lady Dawson, Cannon Hill, Maidenhead, showed bottled fruits and vegetables, all of very excellent appearance. The Committee recommended a First class Certificate to Apple Ellison's Orange (see fig. 64).

Messrs. LAXTON BROS. showed two promising seedling Apples, both raised from Cox's Orange Pippin crossed with Cellin, named Perfect and Delight respectively. The former is very like Cox's Orange Pippin in shape, the skin being greenish-yellow with a richly flush. Both fruits are of medium size.

An interesting exhibit of Apples was staged by Mr. ALFRED BAYLEY, Revelstoke, Slough, all the varieties being over one hundred years old, gathered from very old trees. Exceptionally fine fruits of Blenheim Pippin, Orange Pippin, C. Ashad, Old English Pearmain, one of the oldest Apples on record, and re-sensibling Mother; Bee Apple and Lisbon, a solid-looking fruit, said to be a long keeper, were included.

The Floral Committee recommended Awards of Merit to a new Berberis from China named B. polyantha, and Vitis betulifolia, also from China. Nine medals were awarded to collections.

The Orchid Committee recommended one First class Certificate and three Awards of Merit to collections.

At the 3 o'clock meeting of the Fellows Mr. Edward White gave a lecture on "Pergolas and their Use."

Floral Committee.

Present: Messrs. H. B. May (chairman), J. W. Barr, J. Hoar, J. Dakson, C. Dixon, W. P. Thomson, C. E. Peatson, J. Green, R. Hooper Pearson, G. Reuther, C. R. Fielder, J. T. Bennett Pore, W. A. Binney, A. Turner, W. J. Bean, R. C. Notcutt, A. G. Jackman, J. Hudson, J. F. McLeod, J. W. Blakey, H. J. Jones, and E. H. Jenkins.

AWARDS OF MERIT.

Berberis polyantha. This plant produces a profusion of coral-red berries, which are developed in small bunches along the arching shoots. It forms a shrub about 3 feet high, and has clusters of small, acute-spinulate leaves with three spines, each about 1/2 inch long. The general appearance is after B. Wilsoniana, but the plant is a much taller grower. From the Society's Gardens, Wisley.

Vitis betulifolia.—This new vine was described briefly in the issue for October 13, p. 155, when it was exhibited in much finer condition than on Tuesday last. The leaves are entire, cordate, about 2 1/2 inches long, prominently veined, and have a stalk 1/4 inch long. The fruits are developed in profusion, forming small bay bunches, the berries being very dark blue almost black, with a paler bluish bloom. The foliage had assumed fine autumn tinting, the brighter colours contrasting well with the sombre looking berries. It is an acquisition for enriching pergolas and trellises out of doors. Shown by Mrs. BURKETT, Spetchley Park, Worcester.

GROUPS.

The following medals were awarded for collections:

Silver Flora Medal to Messrs. H. B. May and Sons, Edmonstone, for Ferns.

Silver Banksian Medals to Messrs. J. CHAM and Sons, Crawley, for autumn foliage and berries; Mr. F. LILLEY, Guernsey, for Nerines;

Messrs. PIPERS, Langley, for berried shrubs, and Mr. E. HIGGS, Twyford, Berkshire, for Roses.

Bronze Banksian Medals to THE ALDER RIVER NURSERY Co. for Lilies and other flowering plants; Messrs. ALLWOOD BROS., Wivelsfield, Haywards Heath, for Perpetual-flowering Carnations; Rev. J. H. PEMBERTON, Havering-atte-Bower, for Roses, and Mr. G. RYLAND, Keston, Kent, for Nerines and rare shrubs.

ORCHID COLLECTIONS.

Present: Sir Jesemiah Colman, Bart. (in the chair), Sir HARRY J. VEITCH, Sir Fred. Moore, Messrs. Jas. O'Brien (hon. secretary), W. Bolton, C. H. CURTIS, W. H. White, Arthur Dye, J. Cypher, J. Charlesworth, Frederick J. Hanbury, Pautia Hall, Fred K. Sander, J. Wilson Putter, R. A. Rolfe, T. Armstrong, and Stuart Low.

The chairman referred to the great loss the Committee had sustained in the death of Mr. Elijah Ashworth, Harfield Hall, Wilmsham, and Mr. O. O. Wrigley, Bridge Hall, Bury, Lancashire, both members of the Committee. On the proposition of the chairman it was decided to send a message of condolence to the members of both families.

AWARDS.

FIRST CLASS CERTIFICATE.

Odontoglossum crispum The Premier, from Messrs. CHARLESWORTH and Co., Haywards Heath. A home-raised seedling with a slender spike of two very large and finely shaped flowers, and probably the finest typical white crispum ever shown. The broad, overlapping sepals and petals are pure white, the large, fringed lip having one large red brown blotch and a band of smaller spots around the light yellow crest.

AWARDS OF MERIT.

Sepha Lachis Cattleya in Buckingham (parentage unrecorded), from Dr. MICHEL LAUROZI, Bryndy, Buckingham. A superb hybrid of intensely rich colour and nearest to S. L. C. blotchley flora, but larger and darker. The flower has a rounded lachis form, is of perfect shape, almost entirely bright chestnut crimson with a slight red shade, three white lines extending from the base to the centre of the lip, with some shorter lines on each side.

Laelia Cattleya St. George, *Bryndy variety* (L. C. St. Gothard x C. Fabian), from Dr. MICHEL LAUROZI. A noble flower, adhering closely to the Cattleya shape, but of greater size. Sepals and petals light rosy mauve; lip purplish crimson with slight lilac margin and gold-yellow disc.

Laelia Cattleya Zeno (L. C. St. Gothard x C. Zeno), a fine flower, with a resemblance to the best form of C. Warneri, light rose in colour, with rich crimson front to the broad well displayed lip.

PRELIMINARY COMMENTARY.

Odontoglossum Adams (hybrid unrecorded x *crispum* Adams), from Messrs. ARMSTRONG and BROWN, Orchidhurst, Farnbridge Wells. A remarkable and highly interesting hybrid, flowering first to the first time, and showing in its clear white flower, with occasional deep ruby red blotch the features of *O. crispum* solum, including the irregularity of the markings.

Odontoglossum Aspinii (MOR. x *Colosseus*), from Messrs. ARMSTRONG and BROWN. A grand flower, equally blotched with clear red on a white ground.

Odontoglossum Nymphaeatum x *Abundant*, from Messrs. CHARLESWORTH and Co. The flower is of good shape, three-fourths of the inner parts of the segments being blotched with clear purple, and the tips tinted rose.

GENERAL EXHIBITS.

Dr. MICHEL LAUROZI showed Cattleya Medal to Octave Doin x Dowiana aurea, resembling an improved C. Dowiana aurea, and C. armata-florosa (Wassermann x Mendelini), a very large flower with the general features of C. Mendelini.

SIR JESSEMAH COLMAN, Bart., Gotton Park (gr. Mr. J. Collier), showed a fine spike of

Cattleya Browinae with sixteen flowers, and a large inflorescence of Odontoglossum coronatum.

Messrs. CHARLESWORTH and Co. were awarded a Silver-gilt Flora Medal for a fine group rich in handsome Brasso-Cattleya and Laelia-Cattleyas. New and choice plants included Cattleya Mira (Rhoda x Dowiana aurea), light sulphur-yellow with a deep crimson lip, and Laelia Cattleya Laura (L. C. Scylla x C. Lord Rothschild), of a delicate apricot-yellow tint with rose-coloured markings on the lip.

Messrs. ARMSTRONG and BROWN were awarded a Silver Flora Medal for an excellent group of pure hybrids, one of the best being the handsome yellow Brasso-Cattleya The Baroness Orchidhurst variety, the bloom being of perfect form and great substance.

Messrs. SANDERS, St. Albans, were awarded a Silver Flora Medal for a good group, consisting principally of fine hybrid Cattleyas, the forms of C. Fabia, both light and dark, being excellent.

Messrs. J. and A. McBEAN, Cooksbridge, were awarded a Silver Banksian Medal for a group in which the forms of Cattleya Enid, C. Fabia, C. Iris, C. Hardyana, and C. Prince John were effective. An interesting novelty was Odontoglossum Nanette (Oncidium incurvum x Odm. Hedydium), with an erect spray of rose-blotched flowers.

Messrs. HUSSALL and Co., Southgate, were awarded a Silver Banksian Medal for a group of fine hybrids, in which the new Brasso-Cattleya Moira (B. C. Digbyano-Warneri x C. Gaskelliana), a good, white variety with a chrome-yellow disc, and Cattleya Hilary (Harrisoniana x Enid), magenta colour with yellow lip having purple markings, were noted.

Messrs. STUART LOW and Co., Jarvisbrook, Sussex, were awarded a Silver Banksian Medal for a group, the central plant in which was the new Brasso-Laelia-Cattleya President Wilson (L. C. Lustre x B. C. Mrs. J. Leemann), a fine bold flower, light rose colour with a deep rose-purple lip having a yellow disc.

Messrs. FLORY and BLACK, Slough, sent Laelia-Cattleya Phyllis (L. C. Rubens x C. Dowiana aurea), a pretty and richly coloured flower.

Mr. E. V. Low, Wivelsfield, Sussex, showed a good form of Cattleya Venus, C. Gaskelliana alb., two Dendrobium Phalaenopsis hololeucum, and Laelia Cattleya luminosa aurea.

Fruit and Vegetable Committee.

Present: Messrs. W. Poupard (in the chair), W. Bates, E. Beckett, A. Bullock, A. R. Allan, H. Markham, J. Allgrove, F. Jordan, E. A. Bunyard, G. P. Berry, W. H. Dyers, and W. Wilks.

FIRST CLASS CERTIFICATE.

Apple Ellison's Orange (see fig. 64).—This variety, which gained an Award of Merit on October 10, 1911, was raised by the Rev. C. C. ELLISON, Brockbridge, Lincoln, from Cox's Orange Pippin crossed with Calville Blanc. The fruits are 3 inches in height and rather more through the centre, those illustrated being half natural size. The skin is flushed all over with red on a mellow, yellow ground. The flesh is faintly tinged with yellow and of good flavour. The eye is set in a rather deep cavity and the stalk also, the latter being about 1 inch long. The season is said to be from October to Christmas, but specimens we have seen are already over-ripe (October 24). Shown by Mr. H. MARSHAM, Wrotham Park Gardens, Burnet.

TRIAL OF SPRING SOWN ONIONS.

The following awards have been made to spring sown Onions after trial at Wisley:—

BESTLY COMMENDED. No. 35, A1, sent by Messrs. SUTTON and Sons, Reading; No. 20, Ailsa Craig, sent by Messrs. Dobbie and Co., Edinburgh; No. 12, Bedfordshire Champion, sent by Messrs. SUTTON and Sons, Reading; No. 32, Champion, sent by Messrs. E. W. King and Co., Coggeshall.

COMMENDED. No. 26, Up to Date, sent by Mr. Gray, Sandy, Beds.

CROPS AND STOCK ON THE HOME FARM.

SOWING WHEAT.

Of all crops on the farm, none will be so important next year as the Wheat crop. Every farmer should strive his utmost to produce a maximum crop, whether it be one with 500 acres or the man with but one acre. There are, nowadays, such facilities of obtaining heavy crops by the aid of manures and machinery, that there can be no excuse for failing to provide one's share.

Wheat cannot be sown too early, but ordinary varieties can be sown too late. If it has to be sown late, owing to the land being occupied with other useful crops, there are varieties of Wheat that will succeed when sown late. When I say there are, in passing, upwards of fifty varieties, no one can complain of a want of choice for any kind of soil or situation. Wheat sown in October germinates quickly; the roots obtain a firm hold of the soil, and the plant does not suffer from severe frost like that sown in December; much of this latter may be lifted almost out of the ground by frost, and cannot make such a successful start in the spring.

I have previously written about the preparation for Wheat when dealing with crops to precede the Wheat crop. The point is now to get the seed in as fast as the land is ready to receive it. In some districts where rain has not fallen so regularly as it has in the south during the last month, some may postpone the sowing on account of the land being too dry to germinate the seed quickly. My advice is to sow directly the land is ready; the seed will receive moisture sufficient, especially if the soil is heavy in character, because in soil of that type it is at times difficult to catch a season. In the case of newly broken up grass land, which may need stimulating to obtain a full crop, after the land is ploughed and pressed, sow some approved Wheat Fertiliser, of which there are plenty on the market, at the rate of 4 cwt. per acre. If the soil is heavy, basic slag or superphosphate would answer, to be followed in February with 1 cwt. of sulphate of ammonia per acre. In the case of grass land the advantage of this manurial dressing is that it will induce the plant to grow quickly and thus escape wire-worms, which might otherwise do much harm to the plant in March and April.

In the case of Clover ley, which was not sheeped or given farmyard manure, a similar dressing will have a beneficial effect.

Summer fallows given farmyard manure at the rate of 15 tons per acre should produce full crops. The land under this preparation will require to be heavily pressed at ploughing time, as Wheat requires a firm seed bed, and not too deeply ploughed. In fact, too deep ploughing is harmful in obtaining quality in the grain; an extra crop of straw may result, but Wheat is not grown mainly for its straw.

Choose fine weather if possible for sowing the seed. A good "season" does much to rid germination and subsequent growth. "Muddled in" seed during wet weather cannot succeed nearly so well.

The manner of sowing is much a question of convenience, fashion, and locality. Drilling commits the seed evenly, and is advisable in soil easily managed, but the preparation of the soil beforehand means more labour. In stiff soil the broadcaster is an efficient method of sowing on the ploughed land without extra preparation. Sowing by hand, too, is largely practised on small plots. The Massey Harris cultivator commits the seed regularly to the soil, works the land at the same time, and partly buries the seed, requiring less work in harrowing afterwards. Whatever method be adopted in sowing, harrowing afterwards should be freely done to thoroughly bury the seed, and create a good tilth.

In stiff soil the surface should not be made too smooth for fear of callusing on the surface during the winter. A cloddy surface is an advantage, being a moderation during the winter from winds. The clods, too, crumble in spring by the action of the weather. Such fine soil is beneficial in making firm the plant after harrowing and rolling in March.

The quantity of seed to sow per acre is im-

portant. In October 2½ bushels is ample; afterwards not less than 3 bushels is advisable. Some persons argue that the latter quantity is too much, the plant cannot tiller properly. That may be so, but I think there is safety in numbers; we must allow a little for birds.

Dressing the seed is important as a safeguard against "smut." Prepared dressings are obtainable from chemists which are little trouble and very effective. A solution of sulphate of copper 1 lb. dissolved in one gallon of water for four bushels of seed, is also a good preparation.

An easy way of preparing the seed is to place as much as is required for one day's sowing the day before on a hard floor, pour the liquid over the seed evenly, turning over the seed twice to thoroughly wet every grain. If done on the same day it is not so easy to sow, either by hand or through the drill. *E. Molyneux, Home Farm, Seacroft Park, Hampshire.*

Obituary.

ELIJAH ASHWORTH.—We learn with deep regret of the death, on the 18th inst., of Mr. Elijah Ashworth, Harefield Hall, Wiltshire. An engineer and machine maker by profession, Mr. Ashworth was an old and enthusiastic Orchidist, and for many years his collection has been one of the most complete in the Manchester district. Some eight or nine houses were devoted to Orchids, each section being well represented and the plants (thoroughly well grown. Mr. Ashworth was chairman of the Manchester and North of England Orchid Society from 1906 to 1911, and has been a member of the Orchid Committee of the Royal Horticultural Society for the past 50 or more years. He has also been an occasional exhibitor in London, and more frequently some years ago in Manchester. Among the more notable plants of his collection for which he gained awards were *Cattleya labiata* Mrs. E. Ashworth, *C. Schobleriana* Harefield Hall variety, *C. Trianoae* Ernest Ashworth, *Dendrobium Ashworthianum*, *D. nodosum* Ashworthianum, and *Trevoria chloris*. He also gained awards for many *Ophrys*-like and other rare Orchids, some of which have been illustrated in these pages.

REPLY.

A GOOD MARKET TOMATO.—*L. (See p. 164)* would find Bude's Rebutil an excellent variety to grow for the markets. It produces trusses of very large size that often bear twenty fruits in a cluster. The fruits are smooth and of medium size, deep red in colour, and of excellent flavour. *E. M.*

ANSWERS TO CORRESPONDENTS.

DRAINAGE FOR A VINE BORDER.—*J. W.* If you cannot obtain broken brick, clinker may be used for drainage purposes in a vine border, being the best substitute available. A well-known grower of pot Vines used to drain his pots with broken clinkers, and the roots of the Vines seemed to thrive better in the clinkers than in the broken crocks that are usually employed. It is not necessary to concrete the bottom of vine borders when the subsoil is sandy. Land drain pipes should, however, be used to carry off any undue excess of moisture. Keep the pipes clear at the outlet to prevent the drain becoming blocked. Agricultural drain pipes with no joints, and 4 inches diameter, should be used.

KINDS AND VARIETIES.—*J. W. H.* The term kind is used to denote distinct vegetables, fruits or flowers; thus Peaches, Apples, Plums and Pears are distinct kinds of fruits. Peas, Cabages and Carrots distinct kinds of vegetables. Varieties indicate the sorts. For example, Alexander and Royal George are varieties of Peaches; Beurre Hardy and Conference varieties of Pears; Blenheim Pippin and Cox's Orange Pippin varieties of Apples.

MUSCAT OF ALEXANDRIA GRAPES: *G. Gray.* Muscat Grapes when ripe should be kept in a dry atmosphere. In mild weather a little air should be admitted through the top ventilators at night, but in cooler weather theinery should be kept closed. At this season, if the Grapes are well ripened, a mean temperature of from 45° to 50° is suitable; excessive fire-heat is harmful, and would cause shrivelling in the berries. Keeping the border on the dry side will not cause shrivelling to the extent some growers imagine; in fact, this trouble may arise when the soil is quite moist, as, for instance, when growing in an outside border. Market growers of Muscat Grapes prefer inside borders, as the roots are then more under control. Shrivelling will often occur through the roots being kept too wet. You do not state whether the border is inside or outside theinery. If outside, it will be advisable to cover it with lights, or corrugated iron sheeting, preferably the former. By the first week in January, even if the Grapes are keeping well, it will be advisable for the good of the vines to cut the bunches and bottle them. Keep them in a dry, dark room, but not in the fruit room proper. Another plan to keep them fresh is to shade the glass to prevent an undue rise in the temperature from sunshine.

NAMES OF PLANTS.—*Correspondents not answered in this issue are requested to be so good as to consult the following number.*

F. Clarke. *Gleditsia triacanthos* (Honey Locust).—*J. N. W., Didsbury.* *Crataegus Crus-galli* (Cock's-spur Thorn).

NAMES OF FRUITS.—*In the naming of fruits, we desire to oblige our correspondents as far as we can, but the task would become too costly and too time-consuming were there no restrictions. Correspondents should observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones; if two of each variety are sent, identification will be easier. The fruits should be just approaching ripeness, and they should be properly numbered, and carefully packed in strong boxes; cardboard is often smashed in the post. A leaf or shoot of each variety is helpful, and in the case of Plums, Potatoes and Nectarines, absolutely essential. In all cases it is necessary to know the district from which the fruits are sent. By neglecting these precautions, correspondents add greatly to our labour and run the risk of increased delay and incorrect determination. We do not undertake to send answers through the post, or to return fruits. Fruits and flowering plants must not be sent in the same box. Delay in any case is unavoidable.*

P. C. 1, Duchesse d'Angoulême; 2, Louise Bourne of Jersey; 3, Fearn's Pippin; 4, not recognised; 5, Cox's Orange Pippin; 6, Pear Cadillac.—*J. H.* 1, New Bess Pool; 2, Calville St. Sauveur; 4, Peasgood's Nonesuch; 5, Ramon; 6, Tower of Glammis; 3, Horned-pea Peasman.—*F. S.* 1, Queen Caroline; 2, Radford Beauty; 3, Duke of Devonshire; 4, King of the Pippins; 5, Beurre Superfin; 6, Comte de Lamy.—*H. T.* Brown Beurre (syn. Beurre Gris). *R. D.* 1, Flemish Beauty; 2, decayed; 3, Souvenir du Congrès; 4, Beurre d'Avalon; 5, Doyenné Boussoch; 6, Autumn Bergamot; 7, Beurre Diel; 8, Beurre de Jonghe; 9 and 10, not recognised; 11, Vicar of Winkfield; 12, Mère de Ménage.—*J. S.* Ross Nonpareil; 2, Orange Goff; 3, King of the Pippins; 4, Gloria Mundi; 5, Ecklinville Seedling; 6, Lord Burghley.—*F. MARKETS.

COVENT GARDEN, October 25.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots such as Aralia Sieboldii, Asparagus plumosus, and various ferns with their respective prices per dozen.

Fruit: Average Wholesale Prices.

Table listing various fruits including Almonds, Apples, Apricots, and others with prices per cwt and per bushel.

REMARKS: The market continues to be well supplied with Apples and Pears. Most varieties are in good demand...

DEBATING SOCIETIES.

BATH GARDENERS'. At the meeting of this association held on the 23rd inst., the results of the Potato competition were announced...

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers such as Arums, Carnations, and various orchids with their prices per dozen.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage such as Aspidistra, Ferns, and various plants with their prices per dozen.

REMARKS: Cut flowers are in a somewhat short supply of choice varieties, which are a little more plentiful than last week...

Vegetables: Average Wholesale Prices.

Table listing various vegetables including Artichokes, Beans, Beetroot, and others with their prices per dozen.

SITUATIONS WANTED (Continued from page iii.)

GARDENER (HEAD WORKING), who several are kept, life experience in all branches...

FOREMAN of good SECOND; chiefly English, life experience, Fruit, Plants, &c.; age 30...

GARDENER (SECOND OF SINGLE HANDED); experienced in all garden and greenhouse work...

LADY GARDENER requires post under Head Gardener, good practical experience, English and English preferred...

LADY GARDENER, two years' training requires post, Greenhouse work, under Head Gardener...

TRADE.

MANAGER or FOREMAN, American Trade Cartons, requires engagement; life experience...

MANAGER or FOREMAN; age 51; Special Expert Raising and Growing, London's General Plants, Bulbs, good salesman...

MANAGER or FOREMAN desires re-employment; life experience in up-to-date London and Provincial Nurseries...

PLORISTS and FRUITERS.

Young lady seeks re-employment, 12 years' high class experience; good designer and decorator...

YOUNG LADY requires re-employment shortly as FIRST HAND in Florists' and Seedsman's Business...

THE ROCK GARDEN

A practical work on the cultivation and management of Rock Gardens, written by Reginald Farrer. One of the best and most popular works on the subject.

By Special Appointment to

His Majesty The King.

MACKENZIE & MONCUR, LTD.,

HOTHOUSE BUILDERS,
HEATING AND ELECTRICAL ENGINEERS, etc.

Although we are at present employed largely on National War Service, we are still in a position to carry out urgent private work. We ask our patrons to give us as much time as possible for the carrying out of such work, so that we may arrange to have it done without reducing our War Service output.

GEORGE BUNYARD & CO., LTD.,
Royal Nurseries, MAIDSTONE.

THE DIFFERENCE between a good advertisement and a bad one is a frequent subject of discussion among those who are determined to get the most use out of the money they spend on publicity. But, in the end, it resolves itself into the difference between costly failures and poor ones. Those who are advertising cheap goods naturally turn to a journal with an enormous circulation, even though it may be composed of people of indifferent means. But those who supply the demand and the necessities of a good garden know that such a garden presupposes a man or woman of means as the owner, who can afford to buy the garden itself, but a staff of permanent gardeners to tend it. To such a salesman, a journal which reaches to the tens of thousands, or even millions, is small pay, is next to useless. He should turn rather to a journal, such as the "Gardeners' Chronicle," which reaches the right people, the keen professional gardener and the well-to-do amateur. The response of such readers to a well-written advertisement is immediate and satisfactory.

J. GRAY, LTD., Builder of Conservatories, Heating Engineers, 201, Western, London, W. 1. Telephone 201, Western.

SITUATIONS WANTED.

Twenty-six words for 1/8, and 6d. for each succeeding eight words or less.

Gardeners desiring their Advertisements repeated must give full particulars, otherwise no notice will be taken of their communications. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. (On account should they enter into communication with unknown correspondents who require a fee beforehand.)

Advertisers are cautioned against having Letters addressed to Initials at Post-offices, as all Letters so addressed are opened by the Postal Authorities and returned to the Sender.

PRIVATE.

A GENTLEMAN wishes to recommend his HEAD GARDENER and BALLIFF, his experience in all kinds of Horticulture, in all kinds of Horticulture, and applications to T. E. DOWLING, Debenhams, Tottenham, Co. Kilkenny.

GARDENER (HEAD), BALLIFF, or all kinds of Horticulture, in all kinds of Horticulture, and applications to T. E. DOWLING, Debenhams, Tottenham, Co. Kilkenny.

GARDENER (HEAD). - A Gentleman very highly recommended, in all kinds of Horticulture, in all kinds of Horticulture, and applications to T. E. DOWLING, Debenhams, Tottenham, Co. Kilkenny.

HEAD GARDENER requires permanent position in well established and well equipped establishment, in all kinds of Horticulture, in all kinds of Horticulture, and applications to T. E. DOWLING, Debenhams, Tottenham, Co. Kilkenny.

HEAD GARDENER, where several are kept, 25 years' experience in good establishments, in all kinds of Horticulture, in all kinds of Horticulture, and applications to T. E. DOWLING, Debenhams, Tottenham, Co. Kilkenny.

GARDENER (HEAD) desires Re-engagement in good establishment, age 35; thorough knowledge of all branches. Please state wages and full particulars to W. EAST, 17, Brunswick Road, Edgware, London, W. 11.

ADVERTISER seeks Situation as HEAD in charge of Gardens or Estate; private or public; of all kinds of Horticulture, in all kinds of Horticulture, and applications to T. E. DOWLING, Debenhams, Tottenham, Co. Kilkenny.

HEAD WORKING GARDENER seeks re-engagement where several are employed; 24 years' practical experience, in all kinds of Horticulture, in all kinds of Horticulture, and applications to T. E. DOWLING, Debenhams, Tottenham, Co. Kilkenny.

GARDENER (HEAD WORKING), where several are kept, all round experience, married, in all kinds of Horticulture, in all kinds of Horticulture, and applications to T. E. DOWLING, Debenhams, Tottenham, Co. Kilkenny.

GARDENER (HEAD WORKING) requires re-engagement. His experience, 10 years as Head, in all kinds of Horticulture, in all kinds of Horticulture, and applications to T. E. DOWLING, Debenhams, Tottenham, Co. Kilkenny.

SITUATIONS WANTED continued on page 112.

PERGOLAS,*

THE pergola was evolved as a matter of necessity in the blazing gardens of the East; the shade giving grape vine being a perfect means to hand. It is evident that the vine played the chief part in the origin of the pergola, but how long ago no one can tell. China has ancient records bearing on the matter, but for sheer antiquity it is hard to beat the representations in Egyptian hieroglyphics, which suggest with some accuracy the form of the pergola of today. What is in effect the cross section of a vine-clad pergola occurs as a decorative idea in many places. Notable examples are furnished on friezes unearthed from the ruins of Pompeii and Herculaneum.

Trellises of fruit trees and vines were employed to temper the sunshine in Roman gardens, while later, but centuries before the general adoption of decorative gardens in this country, pergolas and pavilions, tunnels and arched hedges, were de vogue in Italy.

Mr. Imigo Tricci, in one of his excellent books, quotes Crescenzi, the Italian garden designer of the 15th century, who wrote of his pergola of vines as follows: "As in trees of this kind shade is sought rather than the fruit, they must not be too thick, and care should be taken that the trees be neither too many nor grow too thickly, because the shutting off of the air corrupts the health of the place, also because the garden requires a free current of air."

That was written nearly 700 years ago. In the Renaissance gardens of Italy, a century or so later, pergolas attained the zenith of extravagant elaboration.

The history of the pergola in England is linked up with that of trellis arbours, galler walls, pleached alleys, and the like, which from early Tudor days onwards have been familiar features in fine gardens. The one and as far as I know the only book in England devoted to this particular subject, is *Smicason's Book of Pergolas*, published early in the 17th century. The word pergola was formerly used chiefly in the significance of the Latin "pergula," meaning a shelter or covering, rather than to describe the hairy garden arbour which now monopolises the term. The expression pergola is noticeably absent from John Evelyn's outline of the magnanimous plan of a garden art which he projected but did not write. Every other convey-

able detail seems to be named in the summary he prepared.

The great revolution which overwhelmed gardeners in the 18th century would have been scarcely practicable if shade had been in imperative condition in the enjoyment of an English garden. The climate, however, did not avail to save any of the shade giving features which favoured formal design. The system of gardening which succeeded and remained in vogue for a century or so, in which straight lines found no place, offered little use for the pergola. An important outcome of informal landscape gardening, however, was the stimulus given to the production

of a pergola which is a straight, exposed, and frequented thoroughfare. A pergola enclosure should be in an accessible part of the garden convenient as a resort. A pergola should not be placed where it is of little use from the practical standpoint.

However charming it may be, and however liberal its wealth of flowers, it does not follow that the addition of a pergola to the large garden pictures is necessarily good. It may be quite otherwise unless it forms part of a considered composition. If it is true in respect of an entirely new garden it is clear that the addition of

FIG. 66.—PART OF AN ITALIAN PERGOLA.

and discovery of new trees and shrubs, and the interest developed in individual plants. These naturally included many fine climbing plants which need some convenient support.

The requirement has been met in the type of garden architecture evolved during the last quarter century, in which the pergola has been so justified that it is now as securely established in English garden design as if the shade it gives were an indispensable necessity.

But it should be remembered that the raison d'être of a pergola is to provide a shady walk, or, at all events, to afford shade where desired, and it should consequently be placed where this pur-

pose is best served in the scheme of the garden.

The most obvious position is a straight, exposed, and frequented thoroughfare. A pergola enclosure should be in an accessible part of the garden convenient as a resort. A pergola should not be placed where it is of little use from the practical standpoint. However charming it may be, and however liberal its wealth of flowers, it does not follow that the addition of a pergola to the large garden pictures is necessarily good. It may be quite otherwise unless it forms part of a considered composition. If it is true in respect of an entirely new garden it is clear that the addition of

* Lecture by Mr. Edward White at a meeting of the Royal Horticultural Society, October 23, 1917.

part of it. The material used for the latter should therefore be carefully chosen in order that it may appear to bind the piers together, and so assist the sense of unity and repose.

The appearance should be substantial and comfortably permanent in effect, but the grace of some pergolas is sometimes compromised by too heavy piers. Seclusion and quietness are desirable for pergolas intended to be used as arbours. A pergola should not unnecessarily monopolise the garden landscape, although it is sometimes a useful device for masking the poverty of an outlook.

When a pergola is placed on the central axis of a garden view the garden is cut in half, and this should not be done without full justification.

The effect of colonnading has an artistic value which is unique in architecture, and is independent of style. Partially clothed columns of a pergola with beams overhead bearing masses of foliage of varying density lend themselves to mending experiment in perspective, and in the play of light and shade. These are factors of too much value to be left to chance. Those who get great enjoyment in a garden by discovering every picture it has to offer, will always pause on the threshold of a well-made pergola in anticipation of the pleasing effects of the lights and shadows. The management of these effects is a difficult art, but the material with which one has to deal—the branches of the plants and the foliage—is amenable to discipline.

One understands and appreciates the importance of perspective effects in the corridors of a house. A pergola offers opportunities of equal value, which, rightly used, dispose of a not uncommon suggestion that it is chiefly worth seeing from the outside.

From an architectural standpoint the pergola is often invaluable as an aid to composition and a means for giving variety in outline, continuity, connection, and other special qualities which it is desired to accentuate. It is specially important as a means of unifying the house and garden.

In fixing a position for a pergola, therefore, one has to consider its practical utility as a shady walk, its relation to the house, and its influence upon the principal garden pictures.

A garden which is well planned generally offers a natural site for a pergola. The most common opportunity lies in the extension of a terrace walk terminating in a garden house or arbour, or working up to some climax at a change of axis.

Excellent effects may be obtained in the fashion of the old gallery walks, by completely enclosing the sides of a formal garden, a Rose garden, or croquet lawn, or some such symmetrical feature. A tennis lawn should not be so enclosed, as the light is spoiled for playing. An ugly wall may often be transformed by building a pergola against it. Conventional situations are easily recognised and are generally available, and wider opportunities may be created with the aid of a little imagination.

A pergola is too rarely associated with water, in which the reflection gives such delightful results. Instances may be quoted of a straight canal flanked by pergolas and connected at the head by a bridge pavilion, of a large pond encircled by a pergola with a fine fountain in the centre, of a square pond with arbours at the corners linked together by pergolas. A charming view is presented by a pergola on the north side of a large pond sheltered by a wood and leading up to a boathouse.

At Marden Park, Surrey, where the slope of a hill was retained by means of a high brick wall, a potential eyesore was transformed into a thing of beauty by the addition of a pergola. A balustrade which protected a walk at the top made an unusual and effective addition.

A pergola is generally well placed where it overlooks a wide view at the summit of a series of terraces. A note of character is given to a pergola from which the ground falls on one side, affording opportunities for steps or dry walling.

A pergola of considerable length is generally improved by variation in what one may call the

roof lines, by a domed section, for instance, over a part arranged for seats.

When the situation of the feature and its relation to the garden scheme are decided, one has to consider the design and details of construction, and subsequently the important question of planting. If the pergola is associated with the house or some other building the design and materials should be in architectural agreement. Timber work is at times quite appropriate to such conditions.

A special essay would be necessary to deal fully with the architectural possibilities and problems of the question. I will not attempt more than a few general remarks on the subject.

The degree of refined workmanship is decided by the style of the house, but the material may be more roughly worked. Columns may be built of many kinds of material, building stone, bricks, roofing-tiles, concrete, and so forth, in addition to wood. Ironwork is not altogether desirable, but it is possible to counteract the effects of contact between the metal and stems of plants by tying on wooden fenders. The occasional practice of haying marble or other such columns from a dismantled mansion for use in a garden is not to be recommended, except for very unusual circumstances. I know three people who have such sets, bought on impulse, and proved useless.

Roughly sawn Oak and Teak are the most suitable timbers for columns. Larch of sufficient sizes is good for rustic work. Scots Fir and Spruce are not lasting. Those pergolas which collapse as soon as the plants which clothe it are arriving at perfection prove a great disappointment, as is one which has to be painted at intervals, and needs stripping for the operation.

It is not worth while to elaborate the architectural details of stone or brickwork intended largely to be covered with foliage. As, however, the columns should be left exposed to an appreciable extent, the colour and texture of the material are important considerations. Needless to say, they must be handled in a craftsman-like manner.

Common stock bricks are ugly in shape and size and very often in tone, and their unnecessary use has often given to a well-planned pergola a commonplace appearance. The pleasant tone which is so much admired in old Tudor bricks may be reproduced by employing selected hand-made English bricks of small size. These are procurable in a soft red colour, which tones well with a warm purple brick, skilfully blended. Delightful effects of light and shade are given by such bricks and accentuated by building with wide mortar joints.

In districts in which building stone can be obtained local material is generally used. Excellent effects are produced by thin laminated stone with rough edges and surfaces, built with the mortar joints well set back, after the fashion of dry walling. A good deal of ingenuity is sometimes expended in making pathwork of local material, bricks, stones, tiles, concrete and such like. Such work needs to be done by a craftsman, with a sense of unity and complete mastery of material, otherwise a laboured and affected appearance results, which is exactly the opposite of the intention. Good work may be done with concrete (sometimes rough casted and tinted), with roofing tiles, fused red and purple brick burrs, and various other building material.

The piers of a pergola are required to sustain the combined burden of the wooden beams and the planting. The business of the beams is to tie together and strengthen the piers, as well as to carry the planting. The piers and timbers must be strong enough for their work, but if they are disproportionately large they will look clumsy. Heavy work is occasionally needed for architectural effect, and it may also be justified by the considerable length of a pergola. Otherwise the effect is more graceful if the material appears just comfortably strong, and no more. This is especially the case in respect of circular piers. One must, of course, concede something

to the semblance of weight in a great mass of foliage.

The following dimensions may be taken as a working average:—

Brickwork piers, 14 inches square; stone piers, 13 inches, varying with quality and size of stone; solid circular stone columns, 12 inches diameter; Oak or Teak uprights, 11 inches square. These are calculated to carry 10-inch by 8-inch longitudinal timbers, and 7-inch by 5-inch transverse beams. The piers are assumed to be 12 feet apart lengthways, 8 feet 6 inches high, and 10 feet from centre to centre in the width of the pergola. These are suggested as minimum dimensions where considerable strength and permanency are desired. The size of the timber may perhaps be increased to advantage so far as appearance is concerned.

The importance of sufficient width cannot be overrated—it makes the whole difference to the comfort and consequent enjoyment of the pergola.

It should be taken as a rule that the breadth should exceed the height, and the distance of the piers lengthwise be greater than the width. The length of the pergola naturally affects the proportions throughout.

Needless to say, the piers must rest on firm foundations. Timber uprights should be charred or treated with preservative. The longitudinal beams may be built into the top of the piers, and the cross pieces should project a foot or so over the sides. It is also better to cut the latter with an upward curve in the middle, as straight transverse beams seen in perspective have the appearance of sagging in the centre.

(To be concluded.)

ORCHID NOTES AND CLEANINGS.

LÆLIO CUTTLEYA BERTHE FOURNIER.

ON August 15, 1899, Mons. Chas. Maron received the R.H.S. Award of Merit for a hybrid under the above name, the record given being *L.C. elegans* × *C. Dowiana aurea*. The record was provisionally accepted, and the picture marked "Probably *L.C. Schilleriana* × *C. Dowiana aurea*," that natural hybrid being formerly confounded in gardens with *L.C. elegans*. The correctness of the supposition was proved when in 1905 and subsequently Lieut. Col. Sir. Geo. L. Holford, K.C.V.O., showed specimens, and received Certificates for the cross raised in his collection between *L.C. elegans* and *C. Dowiana aurea*. The Westonbirt hybrids were quite different from the plant first shown by Mons. Maron, which now comes under *L.C. Lucilia* (*L.C. Schilleriana* × *C. Dowiana aurea*), for which Messrs. Jas. Veitch and Sons received an Award of Merit, June 13, 1899. A very interesting plant, part of Mons. Maron's original specimen, purchased from the late Mr. Tracy's collection, is in flower with Dr. Miguel Lacroze, Bynndir, Rochampton. The flower is over 7 inches across, silver-white tinged with rose, and the lip has a primrose-yellow centre and light purple front.

SOPHIRO LÆLIO CUTTLEYA MARION.

ERNEST R. ASHTON, Esq., Broadlands, Camden Park, Tunbridge Wells, sends us a two-flowered inflorescence of this very brightly coloured new hybrid from Sophiro-Cuttleya Thwaitesii (*C. Mendelii* × *S. grandiflora*) and Lælio-Cuttleya eximia (*C. Warneri* × *L. purpurata*). The flowers are 4 inches across, the petals being 1 inch wide, and in shape nearest to the *Laelia* parent. The sepals and petals are deep rosy-nauve, with an underlying shade of scarlet and a slight violet tint. The lip has a tubular base, and is coloured sulphur yellow, with thin, purple lines extending into the front, which, with the front part of the side lobes, is dark ruby red, the contrast between the front and the base being very striking. The column, which is very fleshy, is white with a purple band on the upper surface.

LETTERS FROM SOLDIER-GARDENERS.

WHAT WE CAN LEARN FROM FRANCE.

FROM the French cottage gardener I have gleaned many useful hints in intensive cultivation, but what I wish now to point out is where gardeners may learn much from the Army, though there is also the other side, that we, as gardeners and organisers of labour, could teach the Army a good deal in economic management, as we could also teach French gardeners much of value in horticulture. I say this without insular prejudice, from which I am, I believe, comparatively free.

Take the matter of dug outs, for example. We might easily make use of this method for providing a store-house for roots, and even, I think, for fruit, while such places would provide a certain amount of natural warmth for a Mushroom house or a forcing cellar for Rhubarb, Sea-kale, and Chicory; also for putting bulbs in pots or boxes, which, I imagine, would be quite as well as plunging them in ashes. Such a dug-out would also, I think, serve for retarding many flowering plants. If the entrance were sloped we might easily construct a small bogey running on wooden rails similar to that the Royal Engineers use for bringing out the bags of chalk. This would make the labour of moving plants, roots, and other products a simple one. Of course, most of the ideas I now give must of necessity be merely suggestive, for so far I have had no means of testing their utility or practicability.

The system we have out here of nanking beds of wire netting would do well for fruit storage if the netting were covered with canvas or felt, or even with straw. The beds consist merely of frameworks of rough wood, over which is tightly stretched wire netting, and they are often made in tiers of two or three. I can vouch for their being effective as beds, for I have slept as soundly on them as on any feather bed.

Another thing which might prove useful in a garden is the canvas shed, such as is frequently used for latrines. It is merely a skeleton house of wood covered with corrugated iron, and the walls formed by stretching canvas round the woodwork. These would be very useful as shelters during rainy weather, and, being portable or easily erected, they could be used for potting Strawberries and Chrysanthemums on the spot, for making cuttings, pot washing, storing soil, and for general use in wet weather, or in winter for partial protection for plants in tubs. Then there are the corrugated huts, or what are known as French dug-outs, or when covered with sand-bags as "white elephants." These French dug-outs are formed of two pieces of thick corrugated iron, the corrugations being about 6 inches deep. Each piece forms 3/4 of an absolute of a cylinder, I believe, I am right in describing as a quadrant. The two when set together and joined at the top form a semi-circle, the height in the centre being about 7 feet. They are set on a strong angle-iron, which in turn rests solidly on a thick padding of wood. They are neatly coupled together at the top so as to be perfectly watertight, and when white-washed give a fair amount of light. One end is provided with a doorway, and at the other there is a ventilation shaft, which usually serves the purpose of an opening for the chimney of a stove. For obvious reasons they have no window, and are heavily sand-bagged. A dry wooden flooring can easily be arranged. They are easily set up and taken down, and given a good board flooring provide a very good office. It seems so to me when I see these white elephants that we could here happily combine the useful and the beautiful. I picture to myself a dug-out of this description set up and then covered with rock stones so as to combine a wall garden and rock garden, so that only the door at one end and window at the other are visible, the rest being a miniature rock and wall garden. I can imagine the rock garden artist of the future wishing to form a mound of some height. He

would first of all put in his French dug-out, and then cover it with soil and rocks, leaving an entrance and wind-up space. The rock garden enthusiast could then use this for a store-house or study, or as a cool retreat in summer, practically amidst his beautiful rock plants. It could be made quite non-descriptive, and would form a quiet haunt or a nice summer tea house.

A structure of rock we may call it, would serve for a cheap yet clean and healthy loby. I know one of this description which is roughly 12 feet long and about 9 feet wide, where two officers are quite happy and contented. Each

THE ALPINE GARDEN.

DIANTHUS LINDSAYI

IT is a little surprising to observe from the latest issue of the R.H.S. *Journal* that the hybrid Pink raised by the late Mr. Robert Lindsay, of Kaimies Lodge, Edinburgh, proves so difficult to keep through the winter at Wisley. It is troublesome in this way in the West of Scotland, doing much better in the East, where there is considerably less humidity, but one would have expected

FIG. 67. PERGOLA OF STONE COLUMNS AND OAK BEAMS. (See p. 175.)

has a simple wire bed and a combined wash-and-windrobe made by myself out of bully-hoof boxes. There are also two tables, three chairs, a cupboard, a stove. I can imagine myself and a congenial mate being quite happy in such a place in my booby days. Or the wooden hut might serve the same purpose. I feel sure the men who return will have quite different ideas of housing. The war and the experience it gives alters greatly our ideas of values. We learn to see that many things which we regard as necessities are in reality only luxuries, and sometimes useless ones at that. *William F. Bowles.*

that the climate of Surrey would have suited it well. However, it is a plant worth keeping by those who are fond of Dianthus, its 4 to 6 inch stems carrying the good Tyrian Rose flowers above the greyish foliage. It owes most of its character to one of its parents—*D. neglectus*. But the "blood" of *D. plumarius* blended with *neglectus* seems to have introduced an unexpected liability to injury from damp, although we see this present in some of the finer plumarius varieties at one time so largely grown for exhibition purposes. *S. Vaucliff, Sunningwell, Dumfries.*

ON INCREASED FOOD PRODUCTION.

ALLOTMENTS IN BELFAST.

A REPORT drawn up by Mr. G. H. Oliver, Instructor in Horticulture, Municipal Technical Institute, Belfast—and now serving in France—is on the progress of allotment gardening in Belfast. Allotments were started on a small scale in 1907, and progress was at first slow. From 25 plots in 1907 the allotments grew to 200 in 1911. By 1914 there were 400 allotments, in 1915, 530, covering about 50 acres, but at the end of 1915 there was a very extensive development, and some thousands of additional plots were brought under cultivation. The plots vary in size from 300-400 square yards, and the average value of the produce from each plot is estimated at £5. The ground is mostly building land awaiting development, and the Garden Plots Association which has organised the movement has the same uncertainty with respect to tenure as that which confronts so many allotment-holders in this country. The cultivators are drawn from the most varied classes of the community, and it is asserted—though on what ground we do not know—that the standard of cultivation is higher than in England.

It is estimated (in a subsequent report†) that enough vegetables are grown on an average plot, 30 feet by 90 feet, to keep a family of five persons supplied with green vegetables for the whole year and with Potatoes for six months. Whilst we recognise to the full the great value and potentiality of the allotment, we are of opinion that this estimate errs on the sanguine side—unless the requirements of an Irish family in the way of fresh vegetables is much lower than it should be. But whether the estimate be too high or not, the fact remains that the allotment is a great food producing auxiliary, and we wish that allotments may not only continue to flourish but that they will also increase and multiply.

EFFECT OF REMOVING BLOSSOM ON YIELD OF POTATOS.

Among the experiments carried out during the present year by Messrs. Sutton and Sons at Reading, those relating to the effect of the removal of the blossoms on the yield of Potatoes are of special interest.

The following table gives the results in detail, and from it will be seen that in five out of seven plots experimented upon picking of the blossom resulted in an increased yield, and that the average increase was by no means negligible—amounting to 215 lbs. or an increase of 5 per cent. —

BLOSSOMS PICKED V. NOT PICKED.

	Picked.		Not Picked	
	c. qr. lbs.	c. qr. lbs.	c. qr. lbs.	c. qr. lbs.
Plot 2	4 2 4	5 0 3	4 2 1	5 0 3
Plot 4	5 2 10	4 2 1	5 2 10	4 2 1
Plot 6	5 3 0	5 0 20	5 3 0	5 0 20
Plot 8	5 2 9	5 0 7	5 2 9	5 0 7
Plot 10	4 2 20	4 1 26	4 2 20	4 1 26
Plot 12	5 2 20	5 1 8	5 2 20	5 1 8
Plot 14	4 3 4	5 0 10	4 3 4	5 0 10

36 2 11 34 2 19

	c. qr. lbs.
Picked	36 2 11
Not picked	34 2 19

Increase over not picked 1 3 19

A SECOND CROP OF POTATOS

MR. R. WILSON, Dumfries, who has in former years been successful in raising a second crop of Potatoes on the same plot, has again lifted a second crop of Up-to-Dates. The second crop was planted on July 8 and raised on October 9.

The tubers were of good table size. Seven sets of British Queen, planted on May 19, gave 4 lbs. of Potatoes, from which the seed size was again planted and has given small-sized tubers. *Correspondent.*

GARDENERS AS VEGETABLE COOKS.
